The state government on its part has set up a fact-finding committee headed by the superintendent of Victoria Hospital with the director of medical education as one of its members. But even before the committee could start investigations it has been told in no uncertain terms to confine its enquiries to the government hospital. Given that neither were the donors ever in the public hospital and nor was the operation conducted there, the directive effectively confines the investigations to the head of nephrology who assisted in the operation at Yellamma Dasappa. Ironically, according to the state government spokesperson no action can be taken against the hospital because, lacking any sort of legislation on private medical institutions, the government has apparently not even a monitoring role in private hospitals leave alone, a regulatory one.

In June last, the parliament passed the Organ Transplantation Bill, which has been ratified in many states including Maharashtra. In fact, the kidney scam is, according to the KMC a result of such nefarious activities shifting to Karnataka because of the ratifying of the act in the neighbouring state. But even if the act were to be uniformly implemented in all the states, it is unlikely to kill such unethical practices, although it will certainly curb them. For, such activities are made possible by the current ethos of medical practice. In a society where health care is at a premium, those who practise medicine have inevitably garnered extraordinary social prestige and/or wealth and therefore, power. Moreover, the dominant operating principle of medicine today is not to deliver health care but to repair the body, and at a price. Organ transplantation becomes ethical only in the context of a mechanistic view of the human body, which permits such repair. Further, in a society geared increasingly towards catering for those who can pay, it is inevitable that such repair through replacement will occur at the cost of those who are able to sell the replacements, in this case, organs. At a more functional level, legislations to regulate particular medical practices can be operational only in institutions which are under general surveillance and control by the state. This is a point which has been repeatedly made with reference to the legislation banning sex-determination tests. As in the Karnataka case, there are many other states which have no legislation to monitor or regulate private institutions. Inevitably then, the issue is the regulation of private sector in medicare, whether it is the practice of individual doctors through such agencies as the medical council, or the functioning of hospitals and nursing homes through well-armed state legislations.

Cleaning up the Data

UNTIL recently India's external transactions were shrouded in mystery. Apart from the complexity of data involved, it was the inordinate delay in publishing current statistics on balance of payments, external debt and such other transactions that has been contributing to the difficulties in making a correct assessment of the evolving trends. Of late, however, there has been a refreshing change in this respect – official agencies, namely, the Reserve Bank of India (RBI) and the ministries of finance and commerce, have now begun to publish foreign trade, balance of payments and external debt statistics, fairly regularly. The ministry of commerce has already published the foreign trade statistics, though very provisional, up to December 1994, that is, within a month's lag, and the RBI has released its quick estimates of India's overall balance of payments for the first half of 1994-95 – a record achievement, considering the fact that the final estimates of BOP are available only for 1981-82 and the partially revised estimates only up to the quarter ending January-March 1991.

However, one is not sure if the data base for many weak components of BOP such as, travel, transportation, private transfer payments, and the so-called miscellaneous items on the current account, as also 'other capital (net)' on the capital account, are being firmed up. It is very likely that under the present liberalised system of external transactions, information which was in the earlier regime a by-product of controls is no more available. More importantly, much of the current and capital receipts below such a high-level as \$ 50,000 (or roughly Rs 15 lakh) is based on surveys of unclassified receipts, the results of which are finalised with considerable time-lag. Tourism receipts for the current data are probably based on some historical information on the average spending by tourists.

The RBI press release argues that there was a significant rise in private transfer receipts in response to the price incentive of the market-based exchange rate. Besides, the improvement in private transfer receipts and tourist earnings more than compensated for outflows on account of investment income and non-factor services payments. Details of specific estimates in this respect would have been extremely helpful, for private current transfers based on market-based exchange rate is essentially an euphemism for reverse capital flight. Secondly, with sizeable foreign currency assets having been built up, the country's receipts under investment income should have been large and therefore, net outgo on investment income should have come down

rather significantly. Dividend incomes received by the foreign institutional investors (FIIs) may, to an extent, have contributed to the investment income outgo. In the absence of any specific information either on the numbers involved or on the data sources, it is difficult to make any worthwhile comment. Students of external transaction accounts would also be curious to know about the quality of data relating to sizeable receipts under 'other capital (net)': \$ 2.441 billion during April-September 1994 as against \$ 2.148 billion during the whole of 1993-94. It is very likely that a significant proportion of such inflows may again constitute inward remittance out of the funds stashed away in Swiss accounts. Some attempt to provide information on the nature of these unidentified capital flows should be useful for a more accurate review of the BOP data. In the first place, if they do represent reverse capital flight it is unlikely that they have come in the form of capital transfers; they should be treated as current transfers. Secondly, the item 'other capital (net)' in effect essentially represents 'errors and omissions' on the BOP, that is, exactly one-half (\$ 2.441 billion) out of a capital account surplus of \$ 4.892 billion, remains to be classified rather accurately.

In assessing the recent trends in BOP transactions, a feature on which concrete data have not been forthcoming relates to the return of earlier capital flight. A detailed account of the phenomenon of reverse capital flight which the authorities have obviously been able to achieve by implementing the policy of the so-called market-based exchange rate system and other elements of stabilisation and structural adjustment programmes would be useful. It is said that to an extent even the global depository receipts and other forms of Euro equities which have already touched US \$ 3 billion represent such reverse capital flight. Some attempts to get at the truth in this respect would be helpful as a guide for policy formulation.

Except for the above, the Indian data on BOP are generally of a high quality. However, there are still a few drawbacks in data compilation which need to be sorted out by the authorities. First, despite the recommendations of the IMF Manual to present both exports and imports on free-on-board (fob) basis, the Indian data on imports continue to be provided on cost, insurance and freight (cif) basis, which has the effect of overstating imports and merchandise deficits and understating the invisible figures of transportation and insurance. Secondly, under the liberalised foreign exchange policy, exporters as well as returning Indians are allowed to keep foreign currency accounts abroad including facilities to invest the funds in physical and financial assets abroad. It is hoped that the RBI has a definite scheme of

collecting such data and providing these separately in the BOP statistics. The RBI's regular format for such statistics, as published in its regular monthly *Bulletins*, needs to be expanded so that such details under private or banking capital can be made available to the users of data. Finally, the BOP statistics or import data furnished by the Directorate General of Commercial Intelligence and Statistics do not include the officially-permitted imports of gold and silver; they would have constituted over \$ 1.5 billion each during the past two years. Though a good part of it is obtained by the NRIs which would provide the counterpart entry under private transfer receipts, this is not entirely so because (a) there are tax receipts – which cannot be included under import; and (b) there are now also imports under special import licences (SIL) as an incentive for exporters. Therefore, in the interest of the purity of concepts and data, it is necessary that an approximate classification of imports of gold and silver is made in the external trade and BOP statistics.

HUMAN RIGHTS

Diversionary Tactics

A single *faux pas* by Amnesty International has come as a windfall for the Indian government which has been trying desperately all these years to disprove the allegations made by the organisation about its human rights record. The Indian home ministry and the journalists who depend on the staple dished out by the ministry officials, have swooped down upon Amnesty, branding it as biased against the Indian government.

It all started with the discovery that a journal called *Amnesty*, produced by the British section of Amnesty International, carried a cover photograph in its November/December issue of 1994, captioned 'A Kashmiri Woman in Mourning', which turned out to be – after investigations following a complaint by the Indian High Commission in London – the picture of a Tamil Muslim woman visiting a shrine to pray for help in a place near Kanyakumari. The bloomer was a typical example of the frequent western journalistic practice of taking liberty with geographical and cultural differences in third world countries – a practice born out of the traditional colonial education to treat such differences in a presumptuous way on the assumption that they are not worth any serious attention or investigation. Yet, if any Indian writer or photographer mixes up a Scottish Highlander dress with English attire, or Oxford accent with Yorkshire accent, it immediately provokes derisive comments from the British commentator. We expect Amnesty

International, which had been meticulously recording incidents of human rights violation in third world countries, to be more careful in future in selecting reports or pictures for its publications – so that the Indian government does not get an opportunity to discredit it.

It is good to learn that Amnesty International has already announced an apology and a correction for the controversial cover photograph of its British journal. But have the Indian home ministry and the Indian journalists who are too willing to publish whatever these ministry spokesmen brief them apologised for the misreporting and glossing over of facts of human rights violation that continue to plague Kashmir, Punjab and various other parts of India? In response to Amnesty's exposure of deaths and torture in Jammu and Kashmir, the Indian government continues to dismiss all allegations as false. Of the details of 28 men who had died in the custody of the security forces in Jammu and Kashmir between May 4, 1989 and September 13, 1991, as submitted to the government by Amnesty, till date the Indian authorities had responded to 21. In 18 out of these, the government has simply stated that "it has not been found possible to verify allegations", while in the case of the remaining three, it has denied the Amnesty charge of their being killed in custody.

The Indian government's negative attitude in responding in real and effective terms to such allegations is not confined to Amnesty International, but is also demonstrated in its reaction to UN bodies dealing with human rights in India. The UN special rapporteur on torture and the UN special rapporteur on extrajudicial, summary and arbitrary executions have in recent years submitted numerous cases to the Indian government, highlighting their concern that prisoners are routinely tortured in police stations and that many have died as a result. New Delhi's responses have either been outright denials, or statements that the allegations were being investigated, or that they were 'sub judice'. But the UN special rapporteurs are not known to have been informed of the outcome of these investigations. New Delhi also continues to refuse to allow the two special rapporteurs to visit India, in spite of their official request to conduct on-site investigations "with a view to being in a better position to evaluate the situation and, consequently, proposing constructive recommendations that may help prevent the recurrence of such violations".

Clearly, by seizing on one mistake of Amnesty's the Indian government cannot expect the world to forget and forgive the thousands of acts of human rights violation that its police and security forces have been indulging in all these years.

ORISSA

Congress to JD's Rescue

UNTIL the assembly elections of Karnataka and Andhra Pradesh and the rout of the Congress(I), Biju Patnaik's political prospects were pretty dim. His party, Janata Dal (JD), had lost the Mayurbhanj Lok Sabha bye-election to a Congress contestant in May last year; in June, Khond adivasis of Phulbani a scheduled caste constituency attacked Pano harijans and retaliations and counter-retaliations resulted in the death of 14 people. The adivasis were demanding the renaming of the district as Khandmala, and that it be declared a scheduled tribe constituency. Soon after that a liquor tragedy rattled Ganjam, the home district of the chief minister, reviving unpleasant memories of the Cuttack hooch incident of 1992 in which more than 200 people died. As a sequel, the nexus between liquor mafia and the ruling party politicians again assumed significance. On the political front, Rabi Ray, the former speaker of the Lok Sabha and now the state leader of Samata Party, began to gather the dissidents in the state on the platform of the third front. Among the dissidents were Ramkrushna Patnaik who resigned from the Biju Patnaik ministry two years ago, Biswabhusan Harichandan, the leader of Samajwadi Janata Party (SJP) and Sirkanta Jena who was calling the shots against the chief minister from the periphery of Janata Dal. The dissidents were dissatisfied with the chief minister's style of functioning and charged the state Janata Dal as 'Biju' Dal. They were particularly annoyed over the chief minister's reluctance in seeking the resignations of his two cabinet colleagues, Bijoy Mahapatra and Nalini Mohanty, who were alleged to have links with Belu, the liquor don behind the Cuttack hooch mishap. Even the left parties, CPI and CPI(M) had spurned Biju Patnaik's offer to re-enter into an alliance for the forthcoming assembly elections. Both the left parties had formed an alliance with the Janata Dal in the assembly poll of 1990 and had secured altogether six seats. But the utter failure of the Patnaik ministry to implement the 18 poll promises of the election manifesto compelled the left parties to terminate their alliance in January 1992. The CPI also seemed to be nursing a grudge against Biju Patnaik after an entire party unit of Koraput district went over to Janata Dal last year.

The rout of the Congress in the assembly elections of Karnataka and Andhra suddenly changed the shape of the things to come for Biju Patnaik. Capitalising on the success of the Karnataka state JD and Telugu Desam, Biju Patnaik organised a massive rally, 'Jan Samabesh', on December 30 in Bhubhaneswar as a show of strength.

Political celebrities like NTR, S R Bommai, Ramkrishna Hegde, V P Singh and Laloo Prasad Yadav shared the dias. Influenced by the success of the populist measures of NTR, Biju Patnaik, too, announced Rs 2 per kg rice scheme for eight lakh populace quite without regard to the fact that eight lakh people have been beneficiaries of this scheme since 1990 and the addition will increase the burden on the state exchequer to Rs 80 crore. Worse, under Patnaik's governance rice production suffered a decline and the total area under rice cultivation is reported to have decreased. Moreover, there has been no separate cabinet minister for agriculture since Jagannath Mullick was dropped two years ago.

The other two sops announced by Biju Patnaik include the increase in the reservation quota for the backwards of the state from 12 per cent to 27 per cent (Biju Patnaik incidentally had initially opposed the Mandal recommendations) taking reservations to 65 per cent, and subsidies for farm inputs. Patnaik has announced under his Kalinga Rojgar Yojana, a stipend of Rs 200 per month to unemployed youth so as to organise them against social evils like violence against women and liquor addiction. Though Patnaik prides himself on giving 30 per cent reservations to women in panchayats and urban local bodies the status of women in Orissa remains depressingly low. Not surprisingly, Patnaik's Janata Dal does not have a women's wing.

Despite this 'non-performance' of his government what really is proving advantageous to Biju Patnaik is the tainted image of his major rival and the leader of the state Congress, J B Patnaik. Within the Congress fold there are many disgruntled elements including Nandini Satpathy, Girdhar Gomango, Chintamani Panigrahi and K C Lenka, who want J B Patnaik to be removed from the state leadership. He is also reported to have played a dubious role in the post-rath yatra and Mandal riots in the state. Further, the Congress manifesto merely extends the schemes announced by Janata Dal to a still larger population, for example, 33 per cent reservation for women. The other two opposition parties, the BJP and the Left Democratic Front (LDF), formed out of an alliance of six parties excluding the CPI and the CPI(M), have small pockets of influence and are not expected to create any major problems for Biju Patnaik. The anti-Congress swing in Karnataka and Andhra forced CPI and CPI(M) to rethink and ultimately decide against joining any anti-Biju alliance, a step dubbed as 'sheer opportunism' by the LDF. Nevertheless, there are 672 independent candidates in the fray giving credibility to the grouse that both JD and the Congress, have fielded candidates having either kinship ties with the leadership or anti-social backgrounds.

CURRENT STATISTICS

EPW Research Foundation

The rates of expansion in currency, deposit money and M₁ have all been arrested during the past few weeks as a result of moderation in foreign exchange accruals and the RBI's open market operations, though in the more recent period the foreign exchange accruals have begun to look up. In general a severe liquidity crunch is noticed giving rise to a firming up of the money market rates of interest. Cut-off yields on primary auctions of 91-day and 364-day treasury bills have crossed or come close to 11 per cent as against 8.25 per cent and 9.49 per cent respectively, two months ago. Liquidity crunch in the domestic money market has also been reflected in the firming up of the forward premia for the US dollar in the domestic inter-bank market.

Hindustan Petroleum Corporation

HINDUSTAN PETROLEUM CORPORATION (HPCL) is an integrated petroleum refining and marketing company with 20 per cent share both in refining and marketing petroleum products in India. The company owns and operates two refineries at Bombay and Vishakapatnam with capacities of 5.5 MMTPA and 4.5 MMTPA, respectively. This combined throughput represents about 20 per cent of the country's total refining capacity. It also has the largest lube refinery in India with a capacity to manufacture 2.25,000 TPA of lube base oils. This is being expanded 1,10,000 TPA. It also owns and operates a large product supply and distribution network throughout the country. HPCL has a well established countrywide marketing network including zonal and regional offices, terminals, depots, LPG bottling plants, aviation service stations, retail outlets, and product pipelines. The company has set up an international division for the export of lubes, software and speciality products. The company has entered into collaborative research programmes with reputed research institutes. HPCL proposes the expansion of crude refining capacity of its Visakh Refinery from 4.5 MTPA to 7.5 MTPA. The envisaged facilities are new crude distillation unit, new vacuum distillation unit, new visbreaker unit, augmentation of LPG treatment, effluent treatment, sulphur recovery, utilities and power generation plants. The capital cost of the proposed Visakh Refinery Expansion Project is estimated to be at Rs 870.38 crore. Commercial production of the project is to begin by July 1998. The project on lube base stock augmentation facilities at Bombay Refinery envisages setting up of facilities to produce additional 1,10,000 tonnes per annum of lube base stock including 50,000 tonnes per annum of bright stock. The project would result in the optimal utilisation of refinery by maximising the production of high value lube products to their full potential. The project envisages the setting up of new propane deasphalting unit, new solvent extraction unit based on N-methyl pyrrolidone (NMP) solvent, new hydrofiner and hydrogen units, propane dewaxing unit modifications, and additional power generation and off site facilities. The estimated cost of the project is Rs 232.41 crore. Also proposed is the laying of a multiproduct pipeline between Visakh and Vijayawada with an intermediate booster station cum tap-off terminal at Rajahmundry, for transportation of white oil products like high speed diesel oil, motor

spirit, superior kerosene oil and aviation turbine fuel. Storage facilities with tanks of 12,000 tonnes and 70,000 tonnes are to be provided at Rajahmundry and Vijayawada. This project is to be implemented in two phases at an estimated cost of Rs 467.45 crore. Another LPG import facilities with receipt, storage loading and transportation facilities along with other facilities are to be constructed. HPCL is putting the LPG import facilities at Mangalore to handle 6,00,000 tonnes per annum of imported LPG. The project would cost Rs 1,62.74 crore. The company has about 140 other projects in various stages of implementation. The company to finance these projects is entering the capital market on February 13 with a public issue of 1,73,50,000 equity shares of Rs 10 each along with detachable tradable warrants for cash at a premium aggregating Rs 608.925 crore comprising of 1,35,45,000 equity shares of Rs 10 each at a premium of Rs 330 per share aggregating Rs 460.530 crore and 38,05,000 equity shares of Rs 10 each at a premium of Rs 380 per share on firm allotment basis aggregating Rs 148.394 crore. The issue is to be lead managed by SBI Capital Markets, ICICI Securities and Finance Company, DSP Financial Consultants and JM Financial and Investment Consultancy Services.

Moonbeam Industries

Moonbeam Industries, manufacturer of high quality rubberised car products, fibre pillows, quilts and bed spreads markets its products under the brand name 'Moonbeam'. The company which has a state-of-the-art plant at Sikandarabad, Bulandshahar district, UP, is embarking on an expansion plan of its installed capacity from 1,100 TPA to 5,400 TPA. To part finance the expansion project involving an outlay of Rs 441 lakh as appraised by the Bank of India, the company is entering the capital market on February 21 with a public issue of 20 lakh equity shares of Rs 10 each for cash at a premium of Rs 5 aggregating Rs 300 lakh out of which equities worth Rs 72 lakh have been reserved for firm

allotments to NRIs/OBCs. The UP Financial Corporation is also to subscribe shares worth Rs 18.75 lakh thus leaving net public offer of Rs 209.25 lakh. The company plans to expand to the manufacture of industrial items such as bus and rail seats and also strengthen its marketing base in territories like MP, Gujarat, Maharashtra, AP, Karnataka and other southern states.

Optel Telecommunications

Furukawa Electric Company of Japan, one of the world's leading manufacturers of electric wire and cable, non-ferrous metal, other related products and engineering services and Optel Telecommunications are to enter into an equity collaboration. Furukawa is to invest 10 per cent stake worth Rs 10 crore in Optel Telecommunications which controls 70 per cent of the total Indian fibre optics market. Furukawa also has the distinction of being the first company in the world to successfully manufacture optical fibre cable. Optel Telecommunications has a strong tie-up with Fujitsu of Japan and Ericsson of Sweden. It is the only company in India which has got vertically integrated facilities in terms of manufacturing of optical fibre, cable and related system equipment. The company is expanding its current areas sizeably, with a three-fold expansion in optical fibre capacity from 50,000 Fkm to 1,50,000 Fkm. Doubling of optical fibre cable capacity from 4,500 Rkm to 7,000 Rkm is also underway. A new diversification into poly insulated jelly filled cable (PIJF) with a capacity of 10,000 CKm is also being planned. These expansion programmes are at a cost of more than Rs 100 crore and are to be completed in the 1995 calendar year. The company has a strong R and D base in collaboration with IITs, with advanced capabilities in specialised fibre like fibre amplifier (EDFA) and dispersion shifted fibre (DSF). The company is to soon enter the capital market with its public issue which will fund almost Rs 94 crore of the total fund requirement. While Rs 21 crore is to be financed through a long-term debt from IDBI the rest will flow through internal accruals.

For the Attention of Subscribers and Subscription Agencies Outside India

It has come to our notice that a large number of subscriptions to the EPW from outside the country together with the subscription payments sent to supposed subscription agents in India have not been forwarded to us.

We wish to point out to subscribers and subscription agencies outside India that all foreign subscriptions, together with the appropriate remittances, must be forwarded to us and not to unauthorised third parties in India.

We take no responsibility whatsoever in respect of subscriptions not registered with us.

MANAGER

IDL CHEMICALS

Plans to Diversify

IDL CHEMICALS, the Hinduja-controlled explosives and chemicals unit has done well for the year with net sales going up by 7 per cent, operating profit by 42 per cent, and net profit by 27 per cent. Last year the company had gained from the write back of taxation provision to the tune of Rs 2 crore. The dividend for the year has been enhanced to 16 per cent as against 12 per cent in the previous year. Exports and imports were up by 17 per cent and 6 per cent, respectively. Debt-equity ratio has shown a steady decline in the past three years. Sundry creditors to current assets has been steady at 28 per cent for the past two years. Sales to total assets increased by 3 percentage points for the year as against 99 per cent in the past year. Sales to gross fixed assets showed an increase of 8 percentage points for the year. Earning per share fluctuated from Rs 2 in 1991-92 to Rs 7 in 1992-93 to Rs 5 in 1993-94. Net value added to the value of production declined by 9 percentage points for the year. Remuneration to employees increased from 54 per cent in 1992-93 to 66 per cent in 1993-94. Inventories grew by 6 per cent for the year. Short-term bank borrowings was steady at 145 per cent for 1991-93 and has declined to 120 per cent in 1993-94. The explosive division produced 138.85 million detonators, 15.19 million meters of detonating fuse and 23,382 tonnes of explosives.

The metal cladding division's output increased by Rs 12 lakh for the year. The bitumen emulsion division's sales including exports was up by Rs 6 lakh. The company plans to diversify into castor oil derivatives like hydrated castor oil, a raw material for lubricants, dehydrated castor oil fatty acids, a raw material for paints and speciality coatings, and 12 hydroxy stearic acid, a raw material for lubricants and cosmetics. The company plans to invest nearly Rs 22 crore in a castor project with 27,000 tpa capacity. Diversification into surfactants and agro processing is also planned at a cost of Rs 25 crore. The company spent Rs 10.5 crore in research and development activities which included the design and development of mini bulk trucks, and core load sensing device for detonating fuse.

BOEHRINGER MANNHEIM

Development in Diagnostics

Boehringer Mannheim (India), formerly known as Boehringer Knoll has registered a 10 per cent decline in net sales for the year

1993-94. Operating profit fell by 81 per cent and net profit by 409 per cent. Though other income was up by 33 per cent, depreciation was down by 17 per cent and interest charges by 10 per cent it did not help arrest the worsening situation. The sharp drop in the profits is attributed to the dumping of L-base from China. The company has been a market leader in the marketing of chloramphenicol, branded Paraxin. To maintain its top position the company slashed its prices resulting in a telling decline in its bottomline. Exports of the company was up by 65 per cent, while imports declined by 13 per cent. Debt-equity ratio of the company fell sharply from 140 per cent in 1992-93 to 50 per cent in 1993-94. Short-term bank borrowings to inventories rose by 13 percentage points. Sales to total assets and sales to gross fixed assets declined in the past two years by 15 percentage points and 97 percentage points, respectively. Net value added to value of production fell by 4 percentage points for the year. Remuneration to employees which was steady at around 60 per cent from 1991-93 rose by 29 percentage points for the year.

The diagnostics division registered a growth in sales of 27 per cent for the year. A medium range analyser 'Autolab' and a dip-and-read pregnancy test 'Event Test' were successfully introduced during the year. The diabetes care division now plans to service doctors, pathological laboratories, hospital at select locations. The Mahad project nearing completion was to commence trial runs in August 1994. The 7-ADCA project implementation has been deferred keeping in view of the substantial fall in the selling price. The company invested Rs 14 lakh for its R and D activities. The department is in the process of developing technology for the manufacture of other bulk drugs from the basic stage.

ORISSA INDUSTRIES

Rise in Exports

Orissa Industries (Orind), exporters of basic refractories has not done well for the year 1993-94. Net sales were down by 20 per cent, operating profit by 12 per cent and net profit by 2 per cent. Net profit were down in the previous year too, by 21 per cent. The gravity in the fall of net profit was softened by the increase in other income by 25 per cent, fall in taxation by 68 per cent, depreciation by 6 per cent and interest charges by 5 per cent. The dividend of 22 per cent was maintained for the year. Exports were up by 42 per cent while imports declined

by 38 per cent. Debt-equity ratio fluctuated from 124 per cent in 1991-92 to 110 per cent, in 1992-93 to 116 per cent in 1993-94. Short-term bank borrowings to inventories declined by 10 percentage points during the year. Sales to total assets and sales to gross fixed assets declined by 31 percentage points and 102 percentage points. Earning per share has been steady at Rs 8 for the past two years. Return on investment has declined marginally in the past two years. Net value added to value of production remained steady at 16 per cent in the past two years and has now increased by 5 percentage points. Sundry creditors to current assets has been marginally declining in the past three years.

The recessionary trend in the steel industry forced many mini steel plants to operate below 50 per cent capacity utilisation. This was primarily due to the scarcity of scrap compounded by the increase in price of imported scrap. The steel industry being the major consumer of refractory products, the refractory industry was also affected. Also hike in cost without corresponding increase in selling price affected the margins. The company also faced liquidity crunch. Slow off-take and strict inventory measures by the integrated steel plants forced the company to carry high inventory of finished goods. The company plans to undertake modernisation and expansion plans by incurring an expenditure of Rs 6.5 crore. With the schemes implemented new products like high alumina shrouds and dolomite bricks will be produced. The joint venture in Nepal, Nepal Orind Magnesite is at a standstill since Refractory Consultants and Engineers of Austria are yet to submit the final report of the project's viability. Magnesite and Minerals is being rehabilitated under the scheme provided by the BIFR. Orind Exports, incorporated in 1992, has entered into an agreement with Dalian Xiyang Trading Company and the joint venture company is to be christened Yingkou Orind Refractories, which is to be located in China. The company will be located in Yingkou, economy and technology development zone. Orind is to provide technical know-how.

The company has invested Rs 42 lakh in its research and development activities where the thrust is on the development of synthetic raw materials, purification of low grade ore and the development of machinable castables for the alumina industry.

ROLLATAINERS

Backward Integration

The Faridabad-based 'system' packaging pioneer Rollatainers has done well for the year 1993-94 with net sales going up by

Rs 21.57 crore (31 per cent), operating profit by Rs 3.23 crore (35 per cent) and net profit by Rs 8.8 crore (33 per cent). Net profit would have been even higher but for the fall in other income Rs 38 lakh (38 per cent), non-operating profit by Rs 12 lakh (54 per cent), increase in taxation by Rs 65 lakh (72 per cent), depreciation by Rs 6 lakh (3 per cent) and interest charges by Rs 1.52 crore (39 per cent). The 35 per cent dividend has been maintained by the company. Exports fell by Rs 3.55 crore (63 per cent) and imports by Rs 7.9 crore (10 per cent). Debt-equity ratio fluctuated from 100 per cent in 1991-92 to 120 per cent in 1992-93 to 71 per cent in 1993-94. Growth in inventories was down by 12 percentage points for the year. Gross saving to gross capital formation rose steadily in the past three years from 5 per cent in 1991-92 to 18 per cent in 1992-93 to 32 per cent in 1993-94. Sales to total assets declined from 131 per cent in 1991-92 to 129 per cent in 1992-93 to 128 per cent in 1993-94. While sales to gross fixed assets increased from 202 per cent in 1991-92 to 208 per cent in 1992-93 to 235 per cent in 1993-94. Remuneration to employees has been steady at 34 per cent in the past three years. Earning per share declined from Rs 23 in 1991-92 to Rs 20 in 1992-93 to Rs 9 in 1993-94. Short-term bank borrowings to inventories was steady at 63 per cent for the past two years. The packaging division increased its turnover by Rs 21 crore (42 per cent). To improve the product range, it has upgraded the quality of material for packaging tea, coffee, milk powders and liquids. The paper division continued to perform well with its production of snow-white deluxe and coated board to meet the in-house demand for paper boards. The division's production of coated paper boards has helped the company in improving the quality of cartons produced. The machinery division's turnover increased by 15 per cent with exports registering Rs 1.41 crore. The division has also developed new automatic machines for vacuum packaging. Sidharth paper division grew by 30 per cent for the year. With the expansion of production capacity as per the rehabilitation package approved by the BIFR, the division is now showing consistent performance and has also started to make profits. Its speciality paper has shown a rising demand.

The thrust is on the development of mono carton business, the major customers being Amul and BBLIL. Also with the introduction of edible oil cartons in the Rolapak system, the packaging business is expected to increase. The company also plans to manufacture ice cream cup-making machines and case packaging machines. To meet the raw material requirements a

wholly-owned subsidiary company christened RT Packaging has been promoted, and has already started commercial production. It manufactures flexible packaging material which will be primarily used by the company thereby reducing dependence on outside suppliers for its raw material requirements.

VARUN SHIPPING

On Full Steam

A DD Khatau group company, Varun Shipping is engaged in owning and operating ships on both time charter and tramp basis. The company has shown mixed performance with net sales going up by 55 per cent and operating profit by 107 per cent, but net profit has declined by 9 per cent. This can be attributed to the 20 per cent decline in other income and in non-operating income by 78 per cent. Interest charges and depreciation were high by 115 per cent (Rs 10.55 crore) and by 58 per cent (Rs 6.56 crore), respectively. In 1992-93 the company was able to cancel forward contracts entered into, to hedge its foreign exchange exposures. Since during that year the rupee depreciated, it was able to make profits. In 1993-94, the rupee remained stable and this was not possible. Loans from IFC to the tune of \$ 15 million and from SCICI of \$ 22 million, to finance the

acquisition of new vessels resulted in higher interest charges, and depreciation was also high due to the acquisition of these new vessels. Despite the fall in profit the company has maintained the dividend at 28 per cent. Debt-equity ratio fluctuated from 169 per cent in 1991-92 to 157 per cent in 1992-93 to 190 per cent in 1993-94. Sundry creditors to current assets too fluctuated from 29 per cent in 1991-92 to 35 per cent in 1992-93 to 26 per cent in 1993-94. Sales to total assets and sales to gross fixed assets increased by 8 percentage points and 5 percentage points, respectively for the year. Earning per share fell marginally. Net value added to value of production fluctuated from 44 per cent in 1991-92 to 77 per cent in 1992-93 to 51 per cent in 1993-94. Remuneration to employees was up by 3 percentage points for the year as against 15 per cent in the previous year. Starting initially with operating petroleum products tankers, chemical and edible oil tankers and off-shore supply vessels, it expanded its activities into dry bulk cargo movements. It also possesses one of the youngest fleets in the country. The government's amendments in the provisions of the Merchant Shipping Act has made it easier to secure foreign currency loans from foreign financial institutions on more attractive terms. The company plans to expand and to raise its equity.

Research and Information System for the Non-Aligned and Other Developing Countries

40-B, Lodhi Estate, New Delhi - 110 003

Director, RIS invites applications for the post of **RESEARCH ASSOCIATE** (Rs.2200-4000) : A high second class M.A. in Economics with knowledge of quantitative methods of analysis. Desirable: Experience of two years or M.Phil, degree and working experience of computer/micro-processor.

In addition to pay, allowances are admissible as per RIS rules which are at present comparable to those admissible to Central Government employees. Bio-data should be sent within six weeks to the Director, RIS. Serving employees should route their applications through their employers.

Police as Film Censors

A G Noorani

The Censor Board of Film Certification, by referring to the police the film Bombay on the ground that it dealt with a sensitive event, has made a mockery of the law.

IT is bad enough that the police are made judges of dramatic performances and the customs of literary works. We have now reached a stage when the police authorities are accepted as film censors. The first two cases conform to the law, although it is unconstitutional. The last, however, is in violation of a statute, the Cinematograph Act, 1952, as amended.

The facts of the instant case are set out in Seema Sinha's two reports in *Indian Express* of January 8 and 11. Apparently "five top-ranking police officials have been deputed by the home ministry to decide if *Bombay* in fact for public consumption" (*sic*).

The film, *Bombay*, directed by the famous director, Mani Ratnam, is based on a love story between a Hindu boy and a Muslim girl which unfolds during the riots that set the city ablaze in December 1992-January 1993. Its theme is amity, not strife. It has been made in Hindi as well as in Tamil.

The Revising Committee of the Censor Board of Film Certification constituted by the Board's chairman Shakti Samanta viewed the film on January 6, "along with some top home ministry officials including additional director general P S Ramaswamy and certain crime branch officials previewed the film". The CBFC's regional officer said on January 8 "No decision has been taken, we haven't made up our minds yet." The film was due for release only six days later. Seema Sinha reported: "Mr Samanta said the Home Ministry's opinion is being sought because it involved a sensitive issue. The incidents had occurred in Bombay, some interference from the state government was inevitable, added the regional officer. 'We have to take into account the law and order aspect', he said, adding that the government's 'expert opinion' is expected within seven days.

'We could have passed the film without the government's involvement, but why take the risk? Tomorrow, if some problem occurs, police might turn back and say we didn't seek their opinion. Though we can stop a film's exhibition if it creates

disturbance, we are taking precautions,' explained a senior CBFC member, requesting anonymity...

Portrayal of Shiv Sena chief Bal Thackeray (played by Tinu Anand) in *Bombay* might be a subject matter of controversy as the character was very strong, felt the senior CBFC member. According to the correspondent's report, on January 11, the officials passed the buck, predictably enough to the chief minister, Sharad Pawar, and a senior CBFC official told her, "The government is not very keen on taking any decision immediately". The city police commissioner, Satish Sawhney, "felt the film was not fit for public viewing, and that its exhibition involved risk". Risk of what? The Sena's violence, of course. The actor, Tinu Anand, who played the role of Bal Thackeray said "The dialogues are a direct lift from Thackeray's speeches".

That apart for two good reasons any decision based on police assessment of the Sena's threat will be utterly unconstitutional. In fact the process has already been initiated. First, it is impermissible to delay, let alone refuse, certification because of the fear of violence. A decision which is based on this legally irrelevant consideration is bad. In law that consideration is, indeed, irrelevant as the Supreme Court ruled on March 30, 1989 in *S Rangarajan vs V P Jagjeevan Ram*.

It concerned the Tamil film *Ore Oru Gramathile*. It was granted U certificate for exhibition but on a writ petition challenging it a division bench of the Madras High Court quashed it. The producer moved the Supreme Court. The film, which concerned the reservation policy, won the National Award at the film festival held by the government of India.

The Supreme Court was "amused yet troubled" by the stand taken by the Tamil Nadu government and squarely posed the question: "What good is the protection of freedom of expression if the state does not take care to protect it?" If the film is unobjectionable and cannot constitutionally

be restricted under Article 19(2), freedom of expression cannot be suppressed on account of threat of demonstration and processions or threats of violence... The state cannot plead its inability to handle the hostile audience problem. It is its obligatory duty to present it and protect the freedom of expression. This is the law as laid down by the Supreme Court. A decision which flouts the ruling is unconstitutional.

The second ground is equally incontrovertible. The act confers discretion on the authorities it sets up. They cannot abdicate their duties and functions in favour of others be they the police or the chief minister. Section 3 of the Act sets up a Board of Film Certification "for the purpose of sanctioning films for public exhibition"; examining committees consisting of one whole-time member of the Board and two assessors; and, revising committees consisting of the chairman, one whole-time member and one honorary member of the Board or the last plus two whole-time members.

Explicit provision is made for outside assistance in the form of advisory panels by Section 5 - thus ruling out extra-constitutional or extra-legal 'assistance'. The Board may consult only these panels.

Section 7c is of no avail. The Board can "require any film to be exhibited before it or before any person or authority specified by it in this behalf". This may be done only "for the purpose of exercising any of the powers conferred on it by this Act". Thus the powers are to be exercised by the Board itself in its discretion. Section 7c is applicable also to the central government and to the Appellate Tribunal which is a quasi-judicial body hearing appeals from the Board's decisions.

In the present case, admittedly the government's opinion has been sought. And the decision has been withheld which proves the abdication of statutory power vested in the Board. The Board and its chairman, Shakti Samanta, have made a mockery of the law.

National Rehabilitation Policy

A Critique

Jai Sen

There are several drafts of a 'national rehabilitation policy' prepared by the government in 'private' circulation, and critiques have begun to appear. This note seeks to contribute to the policy debate and suggests that what is needed is a national displacement policy.

THERE are, at the moment, two or three versions of a draft 'national rehabilitation policy' in 'private' circulation in the country, prepared by different ministries in the government of India. The circulation is 'private' only because the government in its usual infinite wisdom has chosen not to publicly circulate them, and indeed has even marked one of the more recent versions as 'secret'.¹ Concerned people have secured copies of most of the versions, and 'private' circulation, study, and debate is presently taking place around them in the country, in the public interest.

Some useful critiques have already started to appear.² This document tries not to cover the same ground but rather to open up some other questions, beyond the question of 'rehabilitation'. In the course of doing so, it has become necessary to engage with the critiques, with some ideas which emerged earlier and which seem to have strongly influenced the current draft policy, and also with some current attempts in civil society to address the draft policy. This note has been prepared towards a public debate on all these documents and on this whole process, and towards what this paper suggests should be a national displacement (and not merely 'rehabilitation') policy.

BACKGROUND

First, some comments on the draft rehabilitation policy:

The government of India has been responsible for the forcible uprooting and displacement of some two to five crore citizens of the country since independence, in the name of what has been called 'development planning', and it has ensured the satisfactory rehabilitation of only a small minority of this total number. This number of people permanently uprooted from their homes, is equal to or larger than the population of many major sovereign countries. Over the past three to four decades, this record has been the subject of numerous protests by those affected, increasingly militant resistance, and an increasingly wide spectrum of criticism and opposition (though more from within civil society than from political parties). The 'secret' draft policy

in hand starts out by recognising that under the current regime of the so-called 'new economic policies', the state will want to take over land even more intensely and therefore will be displacing people with even greater intensity.

Ever since the World Bank was forced to undertake its own worldwide review of 'involuntary resettlement' in its projects [World Bank 1994], to a large extent because of the campaign around the Narmada project, it has been heavily pressuring the government of India to come up with a national rehabilitation policy. Unusual for a policy (even at a draft stage), this document recognises the pressure it faces from movements. The government seems to be admitting that it is caught between conflicting demands – and that it is choosing its economic policies and its backers over the people being displaced, which is only consistent with its policy directions so far. The intent of this draft should not be mistaken, yet the recognition of the need for at least some policy in this area should be welcomed since it vindicates people's struggles in an important way. Any critique of the policy should be done with the understanding that it is a beginning.³

There are important aspects of the draft which can be welcomed and others which must be condemned. As a whole, the document is striking in certain ways – at some points it speaks the language of activists and movements clearly and is unusually candid. Precisely because of this, it is a document that needs to be read very carefully.

POSITIVE POINTS

Let us take the 'good' points first. What must be commended is the candidness of the authors in regard to the forces that caused the draft to be prepared – in short, the militancy of the people of the country and in particular those who have been and are being displaced, and the growing collaboration between the people, activists, the press, and the judiciary. Equally welcome is the blunt recognition that displacement constitutes a violation of people's most fundamental rights, both under the Constitution of the country [the right to settle and reside

anywhere in the country, Art 19(1) (e)] and several international human rights covenants. The recognition that it is especially tribals who have been (and are still being) victimised by displacement in the country, and the acknowledgement of the special history and conditions and of the special rights of tribals, are also very welcome; as is the principle of special provisions and concessions made to tribals being displaced. What would have made this admission even more meaningful is the recognition that displacement is a violation of the right to life not only of tribals but of all citizens, and that courts in the country have widely held this right to include the right to live with dignity and also the wherewithal to do this.

The draft also makes very clear that an equally important concern is that 'international organisations' have taken up the question, and the fear that multilateral development banks "might withhold their loans", given the government's record and the lack of policy in the area, if their own "concerns" in these areas are not addressed. While confirming the stories circulating about pressure from the World Bank, this gives a very different angle to the policy; the argument justifying this position is also very valuable – that it was the World Bank that withdrew from funding the Sardar Sarovar (Narmada) project, and not the government which withdrew because of unacceptable conditions (which is what the government and its apologists have tried to maintain). This admission only confirms what is already widely believed, and is therefore very welcome indeed.

Beyond this, there are several other important recognitions:

- (1) That people being 'displaced' are being "uprooted from the soil";
- (2) That "there should be no displacement without rehabilitation having been completed";
- (3) That the situation being affected is much wider than just the loss of land by those most immediately affected through land acquisition;
- (4) That those who customarily live on forest land and/or who have customary rights to common property resources, and who have so far been labelled 'encroachers' by the property-oriented legal system, are in reality not encroachers and are to be treated in the same way as those who have papers to property (the only thing missing is the substitution of a more valid term);
- (5) That displaced people should have a say in what happens to them, in particular by having representatives on the 'implementation group' and 'plan implementation and monitoring committees' that the draft proposes be formed; and that they should be helped to get organised and that their

representation should be democratically constituted (i.e., not by outside appointees, which has normally been the practise when any committees have been formed at all), with periodic elections.

These are all steps in the right direction, and at the minimum reflect the influence of proposals and demands that have been put forward repeatedly by outside organisations, those presently resisting displacement, voluntary organisations and researchers, over the past two to three decades. Equally welcome is the idea of 'total rehabilitation', and the positive recognition of the input of activists and action groups, and that 'voluntary action groups' should also be represented on the 'plan implementation and monitoring committees'. Though the thorny questions of who decides who is to get on, and how this is to be done, are not addressed in this draft, the direction and the apparent intentions are correct.

In short, what comes through strongly is that the author/s have learned from the experience of the past two decades of struggle and debate across the country around concrete situations of displacement, and related forums and meetings, and have also tried to absorb and reflect some of these lessons in their draft for a national policy. Given several close similarities in wording, it is in particular clear that at least one of the sources of influence has been an important initiative that was taken by some movement organisations and voluntary groups in the mid-1980s towards a national rehabilitation policy [National Working Group on Displacement 1987-89].

WHY SECRECY?

Given all this, the fact that the policy drafts have not been made formally available to concerned groups for their comments, and that they have instead been circulated either anonymously or labelled 'secret', badly spoils the above record established by the author/s for themselves (notwithstanding any government rules or conventions in force; if this is their argument, then the rules need to be changed). These groups range from organisations of oustees from projects of earlier decades, such as the Pong or Rihand dams, or current anti-displacement movements such as the Narmada Bachao Andolan or the Netarhat Sangharsh Samiti and so many others, to the many organisations and individuals concerned with environmental and human rights who have established track records of raising and pursuing important related questions in the public interest.

How long is the government going to go on trying to pretend that such movements and organisations and their efforts are merely 'marginal' (and/or 'disruptive'), and that documents should therefore be kept away from them – when their own policy drafters are acknowledging, as in this draft, the

significance of this role, and when the courts of the country and almost all public forums have now come around to agreeing that these are not marginal but in fact important democratic movements, and that the sharing of information and public debate are vital parts of a democratic polity? How long, moreover, is the government going to go on saying one thing in international meetings (that it is taking the movements into confidence) and practising another within the country? This is a central question, and not a marginal one, in any public and democratic process. If this is the government's policy in terms of their practise, then this whole rehabilitation policy should be regarded as bunkum and should be dismissed; because its foundation, and that of all public policy in a democratic state and republic, must be the government's partnership with and subservience to the people.

The secrecy of the government in this instance, and this continuing tendency on the part of the government, need to be unequivocally and thoroughly condemned. More particularly, the demand must be placed that this draft of the rehabilitation policy, all earlier drafts, and all subsequent drafts, be placed in the public arena; that following this – and not on the basis of drafts that are secured informally or leaked, a national and public debate be initiated around this policy, and before any thought by the government of finalising it; and that in general, the continuing policy of the government to remain secretive, be abandoned in favour of more open, transparent, and consultative governance.

SOME POINTS TOWARDS A POSITION

We now wish to put forward some points towards a position on the national rehabilitation policy (DNRP) that is being drafted by the government and to suggest that we need to move beyond rehabilitation to look at the more fundamental question of displacement itself.

We propose that the fundamental principles underlying any policy in this area, in accordance with Art 19(1)(e) of our Constitution, guaranteeing to people the freedom and right to settle and reside anywhere in the country, and also international law, and which is acknowledged in the DNRP itself, must be somewhat as follows:

(1) "Every woman, man, child, and also community, has the following inalienable rights and freedoms:

(i) To have a place to live in security and dignity, including access to livelihood that they themselves can sustain; and where the term 'security' refers to legal, social and environmental security;

(ii) To stay in their place of dwelling and not be involuntarily displaced or resettled, except under conditions of declared emergency;

(iii) To take central part in any and all decisions affecting their residing and dwelling in any given location; and
(iv) To move and resettle as and when they wish, and not as wished by others."

These points need to be explicitly stated in the opening paragraphs of any national policy as the guiding and organising principles for the policy as a whole. All subsequent sections must be made consistent with the spirit and wording of this introduction. A start to recognising some, but not all, of these principles, has been made in the country's National Housing Policy, prepared during 1987-92, and so their inclusion in the country's rehabilitation policy would only be consistent with, and carrying forward, a direction already initiated by the government of India.

There will also need to be an accompanying second paragraph in the preamble:

(2) "If the state, at any point in time, believes that it is necessary in some larger public or national interest, that people residing in a particular area should move and resettle from that area.

(i) It must make clear the nature of the larger interest to the people to be either directly or indirectly affected by the proposal, in manners which the people so affected would clearly be able to understand, and also publicly and nationally declare the proposal.

(ii) If those required to move decline to do so, there must be a due process available for public enquiry and adjudication, such as a sitting tribunal made up of independent citizens of standing, for disposal of the issue.
(iii) If, beyond the decision of the tribunal, the state still wishes to pursue the matter of displacement and resettlement, the only recourse left to it will be the declaration of a state of local emergency and suspension of the civil liberties of the people affected;

(iv) In case of a decision by the tribunal directing the dwellers to move, or in the case of declaration of emergency conditions as provided for in (iii) above, the dwellers will have the right to 'total rehabilitation', implemented in such a manner that principles 1 (i) and (iii) given above still apply and so that they, economically and physically, move to an improved resource base and are able to achieve a higher state of existence than before being moved; and the state will be bound to fully recognise and implement these provisions before any physical act of resettlement takes place."

DISPLACEMENT AS A GENERAL PROCESS

The question of displacement of people from their habitats, and of their possible rehabilitation, involves much larger questions than the somewhat technical question of 'resettlement' or even 'rehabilitation'. In our view, the larger questions include at least the following.

– Why should people have to suffer what

is antiseptically called 'involuntary displacement' at all? Is this a necessary and unavoidable part of 'development'? If so, why is it always hitting the same sections? - The trauma and fundamental insecurity that the uprooted experience on being displaced from their environments - from their 'home in the world', from lives and means of livelihood that they know and can themselves manage - and often being thrown into alien environments which they do not understand and which are devoid of the symbols that give them security and meaning; - The loss of social identity and autonomy, the discrimination they suffer in new and alien environments, and the economic and social dependence and even bondage they are often forced into as a consequence, - Implicitly, the question of social, economic, and political marginalisation from (or 'integration' into, depending on one's point of view) the mainstream; - The loss of their basis of material, and often also spiritual, subsistence that usually takes place.

These are not mere subordinate questions, they are among the fundamental questions of life, community and society, and the debate around the DNRP must therefore be recognised as including questions of national development itself. The force and relevance of these questions is only made stronger when it is recognised that in India, the brunt of displacement and appropriation has always been borne by those sections that were historically otherwise dispossessed, marginalised, and oppressed, in particular the tribals and dalits. To its credit, the DNRP does raise some of these points and to some extent, does attempt to address them, but only in the most technical manner and without carrying them through to their logical conclusion.

While displacement as a requirement of large projects has undoubtedly caused enormous trauma in the country as a result of the model of development chosen to bring about economic self-reliance, it is vital to recognise that 'displacement' has not taken place only as a consequence of 'projects' (or only through the process of state acquisition of land to which the DNRP tries to limit itself). It is also very much a part of other forms of planned and unplanned development in general, and in particular of the unfolding of market forces; it could even be said to be a requirement of the market economy. Under the regime of the so-called 'new economic policies' currently in force, the process of expropriation and displacement is getting more and more intense, with state and central governments, and private and public enterprise, in competition to set up new projects and new townships and to 'modernise' existing cities. This reality is recognised by the DNRP itself and was stated in an even more forthright manner in the previous draft, then watered down; though

it tends to refer to this happening in some indefinite future, whereas the reality is that the intensity is already with us, such as in West Bengal with the Left Front government's 'new industrial policy'.

The DNRP gives a 'conservative estimate' of 165 lakh people displaced by large projects during the period 1951-85. According to critics, the figure for 1951-90, is nearer 213 lakh [Fernandes and Chatterji 1994], but this estimate is for large projects alone; it does not seem even to cover all kinds of 'large projects'; and it seems to refer to rural areas alone. We therefore propose that the actual count of displacement since independence is in fact much larger; let us conservatively take a round figure of 250 lakh, for all kinds of projects, since independence.

In terms of urban areas, as is well known, displacement and evictions of dwellers is a very common phenomenon, both project and non-project. This is sometimes through formal processes of acquisition of land (such as for large planned projects by the government or public sector), but often it is not - such as in the case of private real estate development, including through physical coercion. Significantly, it is often a direct and indirect consequence of the construction of roads and other 'civic' infrastructure, since these actions lead to increased accessibility or desirability of the areas serviced, thereby raising land prices, rents, etc. and creating pressure on existing occupants to vacate. These well known

phenomena have not been taken into account either in the DNRP or in the critiques so far available. Based on crude estimates, it may not be out of place to project that some 100-200 lakh people may have been displaced in urban and urbanising areas over the five decades since independence, both directly and indirectly. If this figure is accepted - only for the sake of discussion - this gives us a total figure of those displaced since independence, nearer 350-550 lakh.

The DNRP makes a point of recognising that it is tribals who have historically been, and are still being, especially victimised by displacement - and indeed, by 'development'. At the same time, however, it is important to recognise that displacement also severely affects other sections in the country, including agricultural labour (dominantly dalit), fishworkers, small peasants, and the urban-labouring poor; in some ways, what is sometimes called the 'informal sector', in both rural and urban areas. These sections are virtually ignored by the DNRP, and if indeed the agreed task is to look at the larger phenomenon of displacement, then it is essential that the process of debate and policy formulation also take into account these sections and their particular characteristics and history, and any debate must centrally involve them.

Thus, what is needed today is not merely a national 'rehabilitation' policy, but a national displacement policy, of which 'rehabilitation' is only one part. It is also

STRUCTURE AND ADMINISTRATION OF SALES TAXATION IN INDIA

- An Economic Analysis -
(1995-Second Edition)

by

Mahesh C. Purohit

Professor

National Institute of Public Finance and Policy, New Delhi - 110 067

Price Rs. 450.00 ★ US \$ 60.00 ★ Hard Cover ★ Pages XII + 303

★ ISBN No. 81-85930-01-5

Contents Introduction, Fiscal role, Economic effects, Structure of sales taxes: Rate structure, exemptions, taxation of inputs, surcharge and additional sales tax, works contract and leases. Empirical estimates of incidence of sales taxes. Rationalising sales tax structure: Weaknesses of the existing structure, short and medium term reforms, an approach towards State-VAT. Inter-State coordination in sales taxes; Administrative organisation: Operation of the tax including evasion and enforcement, Management Information System; Summary and Policy imperatives

Another valuable treatise from the same author on:

Principles and Practices of Value Added Tax

Lessons for Developing Countries

(1993)

Hoisting National Flag at Idgah Maidan

Ambrose Pinto

While the Janata Dal may have successfully dampened a volatile situation, by persuading the Anjuman-e-Islam to hoist the flag at the Idgah Maidan at Hubli, the long-term consequences may not necessarily stall the communalisation of politics.

FOR the last four years the Idgah Maidan at Hubli has been the site of tension and violence both on the Republic Day and Independence Day. During the last Independence Day six citizens fell prey to the police bullets. The issue was the hoisting of national flag on the Idgah Maidan. The Janata government that has come to power now had assured the citizens of the state that it would solve the problem amicably. Not many citizens thought the Janata Dal would be able to handle the situation. In fact while negotiations were on with the Anjuman-e-Islam society, the body that is in charge of the land, the government was busy erecting barbed wire fences around the ground. Six contingents of the Rapid Action Force and Karnataka Special Reserve Police were deployed. It looked as if the count-down had begun for a show-down between the Deve Gowda government and the BJP which was spearheading the campaign. The BJP had threatened to launch a 'Hubli Chalo' agitation and over 50,000 party supporters were to converge from all over the state in Hubli to hoist the flag. With the hoisting of the national flag by the Anjuman-e-Islam president on January 26 the curtains came down on the four-year controversy. It was a shot in the arm for the Janata Dal government.

To understand the issue it is important to look at some of the facts about the Idgah Maidan. According to the Karnataka High Court verdict the Idgah Maidan is not the property of the Anjuman-e-Islam. The Anjuman was given a licence (not leased) twice a year to hold prayers in the Maidan. The land is the property of the Hubli Municipal Corporation. The court had ordered the demolition of the buildings erected by the Anjuman for commercial purposes. The Anjuman-e-Islam challenged the high court order. As a result the Supreme Court had stayed the order of the Karnataka High Court to demolish the shopping complex. The Supreme Court's modified order extended to the stay on the land too.

The BJP which had spearheaded the campaign for hoisting of the national flag at Idgah even prior to Ayodhya issue for vote bank purposes interpreted the verdict of the Supreme Court differently. The contention of the leaders of BJP was that the Supreme Court verdict pertained to the land in dispute

and the commercial complex built by Anjuman-e-Islam. The chief minister had said that the state government was duty bound to implement the interim order of the Supreme Court and appealed to all parties specially the BJP to co-operate with the government. But the BJP held that the Supreme Court verdict was not specifically against the hoisting of the national flag.

Political compulsions compelled the Dal government to toe the BJP line. The BJP has emerged as the principal opposition in Karnataka. Besides it has won all the three seats in the Hubli-Dharwad Corporation area in the assembly elections. The Rastra Dhawaja Gaurava Samithi (Committee for Respect for National Flag), a front organisation of the Sangh parivar dubbed the government move of implementing the interim order by not permitting the hoisting of the national flag and maintaining the status quo as a fraud. Perceiving the BJP opposition and the possible electoral gains for itself, the Deve Gowda government decided to send signals of its desire to find a peaceful solution to the tangle.

The government did not have too many choices. The first option was to follow the same policy of the predecessor government — of clamping curfew to the extent of choking the normal life in Hubli in the name of abiding by the Supreme Court order. Though that option would have been logically the right one, politically it was not expedient. Therefore, Deve Gowda urged the Anjuman-e-Islam to hoist the flag. His request would have fallen on deaf ears. C M Ibrahim, the defected Congress leader who was appointed the state Janata Dal president came to Deve Gowda's rescue. The Janata Dal made full use of him for the purpose. Initially Ibrahim had publicly stated that the "Idgah Maidan was the property of the Anjuman-e-Islam. There was the constitutional protection for the owners of any private land to choose to permit hoisting of the flag on their land and atop their building or not. There was no instance of national flag hoisting on any religious place. Hoisting of the flag can be done on private lands only if the land owner or organisation permitted it." Ibrahim had assured the people that the government would not take any step that would affect the religious sentiments of the people.

Those statements were short-lived. As the pressure was mounting on the Janata Dal, the party became conscious of the benefits of hoisting the flag in terms of electoral gains. The chief minister called for an all-party meeting. At the all-party meeting it was decided to support the Anjuman if the organisation decided to hoist the flag. However, the CPM had called the government to maintain the status quo. Former chief minister and Karnataka Congress president Bangarappa had attacked the BJP and wanted no flag hoisting till the Supreme Court verdict. There were many other voices against the flag hoisting. Most of the former chief minister was opposed to flag hoisting. So also was Subbaraha, the president of BSP in the state. The Karnataka Muslim Advocates Forum was against any attempts of giving in to the BJP. The Janata Party president Subramaniam Swamy had urged the state government to arrest RSS workers under TADA as a pre-emptive measure. The Karnataka dalit unit workers had decided to prevent BJP leaders from entering the district to hoist the national flag. In their statement they had asserted that the BJP was making an issue of it to divert the attention of the people from the main problems.

The Janata Dal saw more advantages than disadvantages in hoisting the flag. Ibrahim, the party president was sent to convince the Anjuman-e-Islam to hoist the flag. He was supported by railway minister C K Jaffer Sharieff who urged the Anjuman president to hoist the national flag. In typical political style he exhorted his community that the hoisting of the flag would be a warning to the BJP that if it continued to create problems the minorities would be forced to carry out a campaign against the Sangh parivar which was using the saffron flag as its identity. Noting that the RSS 'sakas' were not hoisting the flag the railway minister cynically commented that the BJP too would have to prove that they were part and parcel of Indian society and equally patriotic citizens. "Our national flag is indeed the symbol of our struggle for freedom, sacrifice and sufferings. Thousands of people irrespective of caste, community and creed have given their sweat and blood to win the freedom. As our national flag is our identity, it is sacred to one and all. There is no question of any one disrespecting it... I am sure that the people of Hubli in particular and Karnataka in general will appreciate this approach (of hoisting of the flag) and discourage the BJP from spreading the venom of disharmony and disunity" exhorted Jaffer Sharieff to his own community and the people of the state.

Anjuman-e-Islam heeded the pressures from the two important leaders of their own community, the Janata Dal and the BJP and finally hoisted the national flag. There were fears that those opposed to the move from

the community itself might ferment trouble in sensitive areas. The BJP too was expected to resort to celebrations thereby provoking riots. Fortunately, the government's preparedness for any eventuality served to prevent law and order problems. The flag hoisting was a private affair. The BJP was not permitted on the site. The police had to lathi-charge and open tear gas shells to disperse a crowd of 300 for not being allowed to participate in the event. The Anjuman-e-Islam president publicly stated that they had taken the decision to establish the patriotism of the Muslims. The community wanted "to teach a fitting lesson to the communal and anti-national forces".

No doubt the BJP has lost an important and perhaps, the only issue in local politics. The real motive behind the BJP's design was to show Muslims in poor light and question their patriotism. The fostering of Hindu-Muslim hatred had paid them rich dividends politically earlier. They had won all the three assembly seats in the Hubli area. All through the flag hoisting controversy the party had appealed to Anjuman to exhibit nationalism and patriotism by hoisting the national flag. Now that the Anjuman has hoisted the national flag, the BJP has been robbed of the only issue. The fear now is that the party may create more Idgah controversies. There is already a demand to hoist the national flag in three different Idgahs — one in Bangalore, another in Raichur and the third one in Gulbarga district.

Will Deve Gowda's deal prove counter-productive? It is true that the chief minister urged the Anjuman to hoist the flag to preempt the BJP — the Anjuman should hoist the flag to prove their loyalty and patriotism was Deve Gowda's contention. Such a statement is not devoid of a mind-set. Should a flag be hoisted by an organisation to prove devotion to the mother land? Though Anjuman-e-Islam is a Muslim organisation, it cannot be made representative of the entire community. In no way should the flag-hoisting of Idgah have been associated with the loyalty and patriotism of the Muslim community as a whole. Now that there are more demands for hoisting of the national flag in three other districts, will the Dal government demand periodic testing of the community to prove their loyalty and patriotism?

Given the pressures on Anjuman it could not remain neutral either. But its assertion that the flag hoisting was to establish the patriotism of the Muslims was a misplaced one. Idgah was a local issue that has been politicised by the BJP and made a state issue. Anjuman fell into the BJP trap and associated the problem of society with the entire Muslim community. One fails to understand how the controversy centres on the entire community. It was expected of the Anjuman to at least dissociate the issue from the community. Ibrahim and Jaffer Sharieff are not recognised as the leaders of the community by the

Muslims of the state. Ibrahim's statement that the flag hoisting would put the entire Muslim community in the national mainstream was more a political statement than a real one. Such a statement can further alienate the minority community than draw them into the mainstream. It is no wonder the Anjuman's decision to hoist the flag did not find favour with a big chunk of the minority community.

The government has resolved the issue by

giving into the communal agenda of the BJP. Such a solution cannot be a lasting one. The Janata Dal government in Karnataka has a number of socialist leaders some of whom have worked at the grass roots. Instead of initiating a sustained campaign against the BJP and its communal agenda involving people of the city and the state, the Janata Dal took an easy way out. The consequence is that the minority community had to yield to the majority.

Struggle for Panchama Lands Dalit Assertion in Tamil Nadu

Brindavan C Moses

Desecration of Ambedkar's statue galvanises dalits of Chengalpattu to regain their usurped lands in face of state oppression and societal tyranny.

THE INCIDENT

KARANAI is a small village located about six km west of Mahabalipuram on the Mahabalipuram-Thirukazhukundram road in Chengai-MGR district. On October 5, 1994 the dalits of Karanai and adjacent villages installed a life-size statue of B R Ambedkar on a piece of land owned by Veerabadran, a dalit of Karanai village. This piece of land and its surroundings, measuring about 650 acres, were originally assigned to the dalits of Karanai and seven adjacent villages in 1933, as per the order of the collector of Chengalpattu district. (This land defined as panchama land or depressed class land is issued under special form(D) para 9 of board standing order (BSO), now renamed as revenue standing order. As per this order, any sale or purchase of the panchama land by anyone other than a dalit is considered illegal). In due course of time, these 650 acres of panchama lands at Karanai were usurped from poor and ignorant dalit land-owners and transferred to other communities with an active connivance of corrupt revenue officials and rich caste-Hindus. Prominent among the latter are Goutham Chand, a marwari of Thirukazhukundram, Perumal Swamy, IG (crime) of Tamil Nadu police, and Sakuntala of Vadapalani.

The dalits installed Ambedkar's statue to reassert their legitimate right over the panchama land. But the Chengai-MGR police officials, in collusion with the upper caste usurpers, forcibly pulled down and disfigured Ambedkar's statue on the very evening of October 5. The news of the desecration of Ambedkar's statue spread like a wild fire throughout the district. Thousands of agitated dalits gathered on October 10 in front of the office of the subcollector, Romesh Chand Meena, demanding action against the erring police officials and reinstallation of the statue

at its previous site. The dalits were refused permission to enter the subcollector's room; instead, were thrown out, the sub-collector himself catching one of the dalit leaders by the collar. Incensed at the indecent treatment meted out to them, the dalits left the premises, raising slogans, and squatted on the GST road, the national highway. Instead of giving a patient hearing, the subcollector lost his temper and ordered to open fire on the innocent dalits, half of whom were women. He did not even follow the elementary procedure of voicing a warning through loudspeakers, followed by lathi-charge, exploding of tear-gas shells or buck-shots in the air to scarce away the crowd. John Thomas, a dalit and a non-governmental project-holder, and Elumalai, another young dalit, were singled out and shot by the local police. They were deliberately made targets say the eye-witness. Both had organised many agitations for the welfare and protection of dalits in Chengalpattu. In all 14 persons, including women, suffered gun-shot injuries. To justify the unprovoked firing, the police incited their hirelings to set aflame a bus. The police arrested 130 dalits, including 20 women, and beat them till the lathies were broken. Women were partially stripped and mercilessly beaten.

The NGOs in the district who were supporting the dalits in their struggle to redeem the panchama land were harassed by the police. Their offices were raided and their workers threatened. Apprehending arrest and torture by the local police, many of them obtained anticipatory bail. On November 19, the Dalit Joint Action Committee (DJAC) and Save Panchama Land Movement organised a mammoth protest rally and a public meeting in Madras to condemn the desecration of Ambedkar's statue at Karanai and the unprovoked police firing resulting in the death of two dalits and

their indiscriminate arrest. It was demanded that the panchama lands illegally usurped by the other communities, be returned to their rightful owners, i.e., the dalits. In the public meeting at Panagal Park, Ramvilas Paswan, MP and the president of All India Dalit Sena, and Prakash Ambedkar, MP and the president of the Bharatiya Republican Party declared that the DJAC would reinstall on December 6 Ambedkar's statue on the same spot in Karanai if the Tamil Nadu government failed to do the same on or before December 5. Besides reporting to the press, this decision was informed in writing to the governor and the chief minister of Tamil Nadu. In this context, the committee acquired a piece of land (about 15 cents) as a gift from Veerabadran. He granted this piece from his 4.93 acres of land assigned by the collector of Chengalpattu in 1933.

The police statement mentioning the statue being stealthily taken to Karanai, without prior permission of the police is not only false but mischievous and misleading. There is no need to obtain permission to install a statue in a private land. Moreover, there was no question of Ambedkar's statue being taken stealthily. The Tamil Nadu government had been informed in writing about it. However, on December 6, the statue of Ambedkar was forcibly seized at Singaperumal Koil en route Karanai and detained at the Chengalpattu town police station. The leaders of the DJAC were also arrested and remanded to custody. V Kuruppan, a retired IAS officer and the chairman of the DJAC was taken to preventive custody in the early hours of December 5. Hundreds of dalit activists in and around Karanai were arrested, too. All the roads leading to Karanai were blockaded and all modes of transport checked. Kalpakkam, Karanai, Mahabalipuram and Thirukalukundram were completely cordoned off. Thousands of police personnel were requisitioned and posted in and around Karanai creating a military-like fortification in order to terrorise dalits and prevent the reinstallation of the statue at all costs. All top leaders of the committee were arrested and their vehicles impounded.

This is how other communities try to smother the dalit aspirations with the active support of the oppressive state machinery. Yet, in spite of harassment and intimidation by the upper castes and the police, the dalits are more determined than ever to assert their rights and live with honour and human dignity.

HUMAN RIGHTS VIOLATION

Risking repetition, some clear cases of human rights violation by the revenue and police officials of Chengai-MGR district in the Karanai incident are: (1) The dalits of Karanai and seven neighbouring villages were deprived of the 650 acres of the panchama land assigned to them. These panchama lands were usurped and transferred

fraudulently to caste Hindus and other communities with the active connivance of corrupt revenue department officials. (2) The dalits were denied the right to install Ambedkar's statue on a private land due to the unlawful and unjustified intervention of the police at the instigation of upper caste usurpers of the panchama lands. (3) Refusal by a public servant to receive representation/complaints from the public is a violation of citizen's rights. When the dalit representatives attempted to meet Romesh Chand Meena, the subcollector of Chengalpattu, to present their grievances, the subcollector not only refused to meet the leaders but abused them and necked them out using physical force. Worse still, he ordered police firing on the dalits gathered outside his office. (4) Indiscriminate and unprovoked police firing on the masses is a clear case of human rights abuse. No warning was given to the public which included a large number of village women. Fifty-two rounds were fired. Two persons were killed and 14 persons, including 11 women, received bullet injuries. (5) Right to information is an important right of a citizen. The local press reporters covering the meeting of dalit representatives with the subcollector were threatened by the police. The police fired at them despite the fact that the local police knew them well. Three reporters from *Police Seethi*, a Tamil weekly, *Murasoli*, DMK's official organ and the *Indian Express*, narrowly escaped death. (6) Resorting to lathi-charge and arrest of agitators within the premises of a court is not practised by the police the world over and such an act by the police is looked upon as a clear case of violation of human rights. When the fleeing dalits entered the district magistrate court building, located close to the subcollector's office, they were chased and lathi-charged inside the court building. Some were even arrested inside the court building. (7) Womenfolk should not be kept in the police station after six p.m. But on December 10, 22 women were detained inside the Chengalpet town police station, a whole night in the presence of the DSP. (8) Torture of an accused person in police custody is a case of human rights abuse. Father Yesumarian, a Jesuit priest and a practising lawyer was stripped to the waist and given a severe beating on December 11. Anjalai-ammal, aged 55, of Kurumbirai village and Susila, aged 27, of Madurantakam, were forced to lift their saris and beaten on their buttocks by lathi-wielding women police. (9) Harassing NGOs by raiding their office, exercising constant surveillance and interrogation by them is an effective way of tormenting them. Father Martin, the director of Social Action Movement (SAM) was questioned and threatened with arrest. SAM supported save panchama land committee and often took up the cause of dalits of Chengalpattu district. Many animators and

social workers belonging to various NGOs were arrested. John Thomas who was killed in police firing worked for an NGO, Caritas. Father Yesumarian who was arrested and tortured is a priest working for an NGO called DCLM. Members of the Chengalpattu bar protested against the arrest of Father Yesumarian and went on a one-day strike against his arrest. (10) Even when a hard-core criminal dies due consideration is given to the family and close relatives of the dead. However, in the case of John Thomas' funeral, which took place in his native village Pappainallur near Vedanthangal, none except his parents were allowed to attend the funeral. The death of Elumalai who succumbed to bullet injuries on October 15 in the Chengalpattu general hospital was concealed from his parents and the public for 24 hours. Except his parents, none was allowed to participate in his half an hour funeral. (11) Hand-cuffing or chaining an accused is considered an uncivilised act on the part of law-enforcing authority unless for valid reasons. However, the Chengalpattu police chained Sekhar and Shankar to their cots in the Chengalpattu general hospital. (12) Preventive detention is resorted to under extraordinary circumstances where there is definite intelligence information of an outbreak of large-scale violence over large geographical area. However, this extraordinary power was invoked by the Chengai-MGR police to prevent exercise of legitimate right to landownership. The police resorted to large-scale arrests of dalits all over the district in order to terrorise them. (13) Lastly, on December 6, the right of movement as guaranteed in the Indian Constitution, was completely curbed and restriction imposed on the people of Chengalpattu district.

Communalism and Communal Violence 1994

Asghar Ali Engineer

The communal climate was relatively peaceful in 1994, in part because the people of both communities have understood the designs of communalists. But the secular forces need to maintain constant vigilance to ensure continued harmony.

THE year 1994, though not entirely free of communal incidents, was certainly less cataclysmic than earlier years. As we all know, the year 1993 witnessed the worst communal violence in Bombay and Surat in the first month of the year itself. The January 1993 riots in Bombay were far worse than the riots in December 1992. While the riots in December 1992 were spontaneous outbursts as Muslims came out on the streets to protest against the demolition of the Babri masjid on December 6, the January 1993 riots were carefully planned by the Shiv Sena, as admitted in a press interview by one of its top ranking leaders, Manohar Joshi. Electoral rolls were systematically used to identify Muslim houses, or Shiv Samiks went in disguise to 'survey' on behalf of the Bombay Municipal Corporation or Maharashtra Housing Board and marked the houses belonging to Muslims. In the January phase many more were killed than in the December phase, and the property losses sustained were also much higher. While in December more than 250 persons were killed in police firing, in January 1993 twice as many died in stabbings. One can say that the country had not witnessed such communal frenzy even after the partition riots in 1947.

Perhaps communal frenzy reached its zenith in the December 1992 and January 1993, and the period following these riots has been comparatively trouble free, though communal violence was not totally absent. The Sangh parivar had made maximum use of Hindutva sentiments, and with the demolition of the Babri masjid they lost their most potent symbol of hatred of 'the other'. Hence communal sentiments could not be worked up to frenzy level any more and the BJP had to hunt for other grounds to maintain its electoral appeal. Also, its ambitious march to victory was effectively halted by the SP-BSP combination in UP in the 1993 elections. It would be no exaggeration to say that the SP-BSP victory was the greatest blow to the BJP; it could never recover from it. The BJP's loss was the secular forces' gain. The communal temperature went down drastically and 1994 witnessed very few incidents of communal violence.

The first major incident of communal violence in 1994 was the one which occurred in early February in Kanpur. One of the local

BJP leaders Kala Baccha, having underworld connections, was murdered, and this became a signal for communal violence in Kanpur. The communal situation assumed rather serious proportions and the army had to be called out and posted in eight communally sensitive areas of Kanpur. As the SP-BSP government was determined to put down the violence, the situation could be brought under control with loss of four or five lives only. The Muslims in Kanpur also felt that the role of the police was rather impartial and it put down the violence effectively and speedily. This again shows clearly that when the government is sincere in curbing communal violence, it can be checked much more speedily. The government of Maharashtra, on the other hand, showed complete laxity in December 1992 and January 1993, and the communal forces went on a rampage without any fear. Not only that, the police openly colluded with them. The UP government was so serious in putting down the violence that it did not even permit the open cremation of Kala Baccha's body. It was cremated secretly, and some prominent BJP leaders including two parliamentarians, four legislators and 40 others, were arrested when they protested against the secret cremation. This is how a determined government acts to put down communal violence.

Another small incident occurred on February 27, 1994 in Babri township of Muzaffarnagar district in which several persons were injured though no one was killed. The clash occurred when a person of one community was arrested for obstructing a prayer meeting by playing songs over a loudspeaker in his house. A mob then gathered outside the police station and hurled stones and shot at members of the other community. The situation was brought under control by arresting 25 persons belonging to both communities.

In Hyderabad old city a BJP leader Bal Raj, who was involved in eight cases of communal violence that rocked Hyderabad in 1990, was murdered by unknown assailants, communal tension increased in the walled city and sporadic incidents of violence took place. However, again there was no loss of life and the violence was put down.

Asangaon, some 60 to 70 miles from Bombay, witnessed a communal incident on June 6, 1994. Two children playing marbles fought among themselves and it assumed communal overtones thanks to some Muslim anti-socials armed with guns hiding in one of the houses. One of them shot from his weapon and one Ramesh Dagdu Chande (35) was injured on his shoulder while a bullet pierced 55-year old Gangubai's right forearm. The police identified the one who fired as Ismail Muhammad Mughal, a 30-year old with a past history of crimes. This led to violence from the other side too. A big mob gathered armed with whatever it could lay its hands on including large sticks, axes and stones and went on a rampage picking out each of the seven Muslim houses. They broke every bit of furniture and the roofs of the thatched houses, and assaulted some of the residents. Jamila Sheikh's newly built bungalow was attacked and everything inside was broken to pieces. Her 12-year old son was also severely beaten up and had to be hospitalised. Mercifully this was the only communal incident in Maharashtra in the year 1994.

Gujarat was also by and large free of communal violence during the year under review except for two incidents – one near Nadiad in July and the other on December 7. In fact four villages of Nadiad taluka were disturbed by the communal tension which erupted on Muharram day; at Khuntaj one youth was killed in police firing. In Khuntaj village which has population of nearly 2,500, 70 per cent of the people happen to be Muslims. Most of the Muslims in the village are engaged in farming. The economic condition of the Muslims is quite precarious as most of them are farm labourers. Fortunately the trouble did not spread and the situation was brought under control. Another incident happened at Ahmedabad on December 7. The incident occurred when a group of people wanted to perform 'mahaa arti' on the second anniversary of the demolition of the Babri masjid. However, the commissioner of police, Ahmedabad himself rushed to the spot and defused the situation. As a precautionary measure the Rapid Action Force was deployed in Khadia area. In the disturbances a shop was set ablaze and stones were thrown in Khadia. In police firing the previous day, one person was killed. The police arrested 90 persons on charges of rioting. The police had to fire five rounds and burst 26 teargas shells in the Khadia area when they were attacked by a mob near Junj Gate. The confrontation between the residents of Khadia and the police was over the issue of alleged police lathi-charge on a group of people who wanted to perform mahaa arti. For Ahmedabad city which has witnessed much bigger and frenzied bouts of communal violence this was rather a trivial incident.

The BJP tried to build up communal tension in Hubli on August 15 while it tried to mobilise people for hoisting the national flag on the disputed site of Idgah. It took out a procession on the morning of August 15 despite a ban and tried to hoist a flag. The police fired on the mob resulting in loss of six lives. It was alleged that the BJP tried to work up Hindu feelings on the pattern of Babri masjid in order to win the Hindu votes in the elections which were then due in Karnataka. If this was the aim, and it appeared to be so, it did reap results by winning all the assembly seats in the November elections in Hubli district. It is also alleged that the then Moily government used excessive force to prevent the BJP from hoisting the flag with an eye on the election, i.e., to win Muslim support. If this was so, the Moily government obviously failed in fooling the Muslims. It was thrown out of power.

Another major communal incident occurred in Bangalore in early October. Bangalore Doordarshan suddenly started telecasting a 10-minute news bulletin in Urdu from October 2. It is interesting to note that no Muslim leader from Karnataka had made a demand for such a telecast. The telecast was, in all probability, started to win Muslim support for the November elections. There is no doubt that the Muslims have been greatly alienated from the Congress since the demolition of Babri masjid and the riots that followed the demolition, and the Congress is trying hard to win back Muslim support. So far it does not seem to have succeeded as the election results, particularly in Andhra Pradesh and Karnataka, clearly show. The riots which followed the starting of the Urdu bulletin on October 8 soon acquired communal overtones; more than 30 lives were lost in these riots and property worth crores of rupees were destroyed. The fact that major communal violence took place in Karnataka in the year 1994 clearly shows that the communal forces in that state were trying to carve out their constituencies. It also clearly shows that often communal violence is used to increase one's electoral appeal. This cynical game is played in different degrees by parties like the BJP, the Shiv Sena and the Congress. They do not mind even if innocent lives are lost and the forces of national integration severely weakened. Again, in all probability, the telecast of the Urdu bulletin was begun to win Muslim support on the eve of elections and, on the other hand, the BJP from behind the scenes provoked communal violence to increase its electoral support among the Hindus. The telecast of an Urdu bulletin was so obviously related to electoral politics that the election commission itself banned it, taking it to be a flagrant violation of election conduct rules. Perhaps the

communal disturbances at Bangalore were the major disturbances of the year 1994.

Another town in Karnataka, Davengere, witnessed a bout of communal violence on the occasion of Dasera on October 14 in which two persons were killed in police firing. The police fired on the mob which was armed with bottles, acid and other lethal weapons and was attacking a slum area. Two other persons were killed in the incidents of stabbing and 53 injured including 21 policemen. According to the director general of police the trouble started when the procession was attacked by another group with stones.

A Hindu Munnani leader Rajgopal was stabbed to death in Madurai on October 9, which led to minor communal disturbances in several parts of Tamil Nadu including Madras, Coimbatore and Trippur besides Madurai. One person was stabbed to death in these incidents.

A brief survey of the communal situation throughout India shows that the year 1994 did not witness much communal violence. In the preceding decade it was computed that a riot a day was routine. Thus it will be seen that the post-Babri demolition period has been comparatively peaceful and despite much effort the communal forces have not succeeded in raising the communal temperature. There are various reasons for this – the most important reason is that the masses of people from both communities have understood the designs of communalists. They cannot be easily fooled now.

The Hindus in general did not approve of the demolition of Babri masjid; it came

as a great shock to them. The forces of Hindutva underestimated the tradition of religious tolerance which has prevailed in this country for centuries. It was easier to demolish a physical structure but impossible indeed to demolish the centuries old traditions of the country. Thus the forces of Hindutva have lost much of their legitimacy among the Hindus. The BJP is now in search of issues other than the Ram temple to win over the Hindu masses. It is a great victory of the Indian tradition of tolerance.

The Muslim leaders too who tried to make the maximum out of the communal situation have lost their influence with the Muslim masses. The Shahi Imam's appeal to vote for the Janata Dal fell on deaf ears during the UP elections of 1993. The Imam has been maintaining complete silence ever since. The movement for reconstruction of Babri masjid is also not gaining ground among the Muslims; they do not want any communal trouble in the name of mandir-masjid. They too have very well understood the games some of their leaders play to increase their own leadership stature.

However, one should not become complacent about the communal situation in the country. One has to maintain constant vigilance and strive to spread the message of communal harmony. It is unfortunate that while the communal forces work with a sense of mission the secular forces arise only when there is communal violence. The secular forces too will have to work with a sense of mission if they wish to maintain precious harmony in the country.

A Bold & Factual Account of Third World Exploitation by Western Countries

The Price of an Apple

by
T W Power

We become aware of the turmoil in third world countries only when there is a coup, rebellion or anarchy, as we have witnessed in Somalia, Bosnia, and several other countries. The fact is that two-thirds of the world is in a state of constant turmoil. The end of the cold war with the Soviet Union has directed our attention to the problems of the third world countries. Our leadership in the world depends not on our military might but on our understanding and knowledge of these countries.

The title and the cover of the book are the essence of the story. The APPLE in the title is symbolic of the western wealth which has allured the third world. The Author, Dr. T.W. Power, has written this book on the basis of his extensive personal experience in several of these countries. He has given an account of the history from the perspective of colonial people, leading up to the current involvement of western powers in the economy and politics of the third world. He describes sight and sound of people, their emotional and political struggles, and predicts their future in the 21st century.

As stated above, this book tells a story that is based on the first hand experience of the author with the affairs of the third world and his intimate knowledge of the western powers to keep the third world dependent, underdeveloped, and poor. The story has a special pertinence to the people of India and Pakistan.

From Little Rock to Wall Street

Clinton's Journey Beyond Reaganism

James Petras
Steve Vieux

By initiating anti-poor labour laws, anti-black crime reforms and deducting health-care expenditure to win over big business, the Clinton administration has staged one-upmanship over the Reagan-Bush era in pursuing 'right' policies.

PRESIDENT Clinton's presidency has marked a new phase in the 'right-turn', of the Democratic party: no longer on the defensive against Republican attacks on 'social welfare' policies, he has turned to an offensive strategy... going beyond Reagan and Bush in pushing a neo-conservative agenda. There are two minds on the matter: those who argue that Clinton the Liberal has caved in to powerful conservative pressures; and those who see the right-turn as principally a Clinton initiative, to pre-empt space among the wealthy and powerful. A third, more nuanced approach argues that both processes are inextricably connected. Clinton's conservative initiatives early on in his administration have strengthened and given organisational momentum to the right and weakened and disoriented the liberal left, thus setting in motion a wave that has inundated the pockets of social reform promoted by the president.

The Clinton administration's move beyond Reaganism is best understood by focusing on the basic legislation he has championed and the arguments he has put forth in defence of his legislative agenda. In his first two years the principal areas included welfare, urban decay, foreign trade, wages, pensions, public lands and health. In each issue area social classes are deeply divided between, on the one side, corporate interests, affluent professionals and neo-conservatives, and on the other, the working and urban poor, minorities and ecologists. Before entering into the specifics of the Clinton administration, we will briefly touch on the major structural changes which are now shaping the political agenda of the 'New Democrats', those who have shed the welfare-labour coalition of the New Deal in favour of a straightforward deregulated corporate free market agenda.

GLOBALONEY AND DOMESTIC DECAY

There have been several major changes in US political economy since the 1970s that have had a profound conservative impact on US politics: changes in the workplace, in the relations between organised labour and the Democratic party, in the relation between US corporations

and the world economy, and in the ideology and political leadership of the Democratic party. These structural changes have been reflected in the anti-labour policies adopted by the Democratic party, particularly by the Clinton administration. The main line of reasoning is that changes in the organisation of the workplace, domestic economy and structure of power have been decisive in the increasing globalisation of US capital and politics.

The capacity to subordinate domestic priorities, and to convert labour into an impotent spectator faced with low-paid temporary work, was essential to the ascendancy of globalist rhetoric. The ideologists of unregulated capital argue the reverse: the growth of a global capitalism demanded the cheapening of labour, the cut backs in social spending, greater political stability (repression) and fiscal conservatism. This globalist rhetoric obfuscates the fact that world markets and competition pre-dated the reversal of labour-capital relations by several decades.

The globalists further miss the point that it was not the "pressure on profits" that hastened the movement of capital overseas, but the overaccumulation of domestic profits that facilitated the pursuit of higher rates overseas. Labour by the 1970s was losing bargaining power and by the 1980s was a marginal force – precisely the decades when the greatest moves of capital took place. It was the weakening of labour at the workplace, and the weakening bargaining position of trade unions versus capital, that stimulated globalisation.

The role of the national state, not the world market, facilitated capital movements, by undercutting labour's political power and providing incentives for overseas expansion. In the workplace, labour unions increasingly traded work-rules for security, wages and fringe benefits for jobs, all of which facilitated greater accumulation of capital for export or conversion to new technologies, replacing labour. The net result was a flexible workforce, greater subjection of labour and greater autonomy and mobility of capital to relocate.

The crucial link between labour and state policy was the Democratic party established

through the 'New Deal Coalition' in which trade unions supported capitalist expansion in exchange for higher wages and greater social legislation. By the mid-1970s the Democratic party leadership increasingly reflected the basic shift in US corporate capital. The increasing power and profits of overseas capital and the decline of grass roots labour hastened the right-turn in the Democratic party. Increasingly, the party leadership was dominated by Wall Street populists – politicians who campaigned for social reforms and when elected hewed closely to the editorial line of the *Wall Street Journal*. Essentially the Democratic party co-operated and competed with the Republican party in lowering the social costs of production in the US and increasing the opportunities for overseas expansion. Social agendas were essentially rhetorical exercises to entice the progressive intellectuals into the pre-election fold, to be discarded after the elections. The rhetoric of "global competitiveness" and the "imperatives of the world market" obfuscated the massive accumulation of profits extracted from the domestic labour force and re-invested abroad. By focusing on global market competition, the original source of accumulation was neglected. The new configuration of corporate economic power that emerged was deeply dependent on state policies for world market success, and powerfully situated financially and ideologically to shape the political outlook of the Democratic party. Top party officials and cabinet appointees reflected the new international orientation of capital and its need to reduce domestic costs for overseas expansion.

The 'New Democrats' are 'free traders', 'de-regulators', 'pro-corporate', 'pro-police' and looking toward growth, efficiency and competitiveness as the road to equity. The conservative texture was captured by president Clinton the day after he was elected when he shifted his rhetoric from attacking social inequalities to advocacy of budget balancing.

CLINTON: WALL STREET POPULIST

The fusion of populist rhetoric, symbolic changes and neo-conservative socio-economic policy is most clearly represented by the Clinton presidency. The most striking aspect of the Clinton presidency is the capacity to push a neo-conservative agenda that goes beyond the Reagan-Bush administrations. On the major substantive issues affecting the poor, blacks and labour – welfare, social decay, wages and capital flight, – Clinton has come down hard on the side of big business and conservative interests.

While Reagan and Bush frequently engaged in rhetorical attacks on welfare recipients, it is the Clinton administration

which has aggressively pushed a programme cutting off welfare recipients from federal programmes and forcing them to work for wages below the poverty level. The push to reduce welfare spending and turn welfare recipients into indigents has been presented to business and conservative interests as proof that the Clinton administration is more budget-conscious than its Republican counterparts. The rejection of social welfare and the promotion of forced labour have been the hallmark of rightwing policy-makers since the 19th century. In competing with the rightwing republicans for big business approval, Clinton is simply demonstrating the close ties between big business and the Democratic party. What Clinton dubs welfare reform is in reality the restoration of an anti-welfare regime.

The second major area in which Clinton has chosen to define his social conservatism is in the area of the crime reform legislation. Once again, Clinton has gone beyond the Bush 'Willie Horton rhetoric' to implement one of the most repressive pieces of Federal legislation. The law, clearly directed at the growth of violence and crime in the ghettos, calls for a vast increase in the application of the death penalty, 1,00,000 more police, billions for new prisons. The massive de-industrialisation that has destroyed jobs, neighbourhoods and families and that produces social decay, is not confronted. Capital flight that laid waste to whole working class neighbourhoods is not only ignored but actually promoted. A below-subsistence minimum wage and the vast growth of low-paid service jobs that force young people to choose criminal livelihoods is ignored. Clinton blames the ghetto victims of capitalist disinvestment and low wage policies for the adverse social conditions that affect them. In a speech in Washington in the fall of 1993, Clinton denounced blacks for not taking 'responsibility' for controlling their own violence, thus earning the praise of business interests and the mass media for his 'courage' in siding with the rich and blaming poor blacks. Having established in the public's eye that crime is a product of personal responsibility and not a result of socio-economic conditions, Clinton was assuming the posture of the Reaganite Right. The problem of crime was to be confronted not by disciplining capital to invest in creating decent paying jobs but by increasing repression. Neither Reagan nor Bush dared to point the finger at the black community for the violence resulting from social decay, capital flight and state disinvestment.

If Clinton's welfare and crime legislation was an unprecedented direct assault on the minority poor, his posture freezing the minimum wage at 40 per cent below what it was during the early Reagan years, and

1 Indian Shareowners: A Survey (1991)

The study presents the findings of the first all-India Survey of Indian Shareowners, covering their growth, profile, portfolio characteristics, experiences, preferences, intentions, time horizons, and also how they look upon the services and information provided to investors by companies and market intermediaries. It is based on a cross-sectional sample of about 6000 households who were personally interviewed.

The survey is divided into five parts: (1) Growth and profile of shareowners, (2) Portfolio characteristics, (3) Shareowners' experiences, (4) Intentions, and (5) Service and information quality.

The Survey had been sponsored by the Securities and Exchange Board of India, SBI Capital Markets Limited, Canbank Financial Services Limited and Bombay Stock Exchange.

Price Rs. 180/- in India ; US \$ 30 outside India

2. Stock Exchange Trading in India: Agenda for Reform (1992)

The Stock Exchange Division, Ministry of Finance, Government of India, asked the Society in early 1991 to examine the present systems, practices and problems in stock exchange trading and to make recommendations, specially concerning the **Badla** (carry forward) system.

The above study examines the various problems at length, supported by empirical data. Wide-ranging reforms are suggested in order to make securities trading efficient, orderly and fair.

The book is divided into two parts. *Part One* presents empirical analysis. This part covers an examination of the Indian trading practices, the volume and effects of speculation, investors' complaints and difficulties, jobber's functioning, price volatility, market liquidity, structural shortcomings, and stock exchange administration.

Part Two presents reform proposals, as suggested by the Society's study, as also by the Pherwani Committee on New Stock Exchanges.

Price Rs. 200/- in India , US \$ 30 outside India

3. Mutual Funds and Asset Preference: Household Investor Survey, 2nd Round (1993)

The survey was sponsored by the Unit Trust of India. It is based on intensive personal interviews of about 2200 household heads on all-India basis. It presents extensive empirical data and analysis of investor perceptions about mutual funds and changing asset preferences.

Price Rs. 250/- in India . US \$ 30 outside India

4. Shareowners' Geographic Distribution: City-wise, Urban-rural, State-wise (1994)

The analysis shows both the present distribution and how it is changing. It is a scientific, thorough-going, painstaking analysis, not a routine commercial compilation.

Its value lies also in providing a technique which can be used by marketing people for estimating shareowning population of particular cities several years into the future. Apart from its usefulness in the marketing of securities, the study provides insights into certain deep-seated and not-so-visible changes taking place in the Indian capital market.

Price Rs. 390/- in India ; US \$ 30 outside India

RESEARCH IN PROGRESS

P/E Ratios in India, sponsored by the Indian Council of Social Science Research

The study is intended to trace the dramatic historical change in Indian P/E ratios during 1980-94 against the international background and the factors behind the change, as also in the light of financial theory. Other aspects to be examined are how P/E ratios are related to company size and how the future return on equity share investment is related to the P/E ratio at the time of purchase.

the continuing decline of wages and salaries (2.5 per cent) during his first two years, are indicative of his willingness to sustain Reaganite trickle-down economics into the mid-1990s.

Robert Reich, the secretary of labour, has rehashed all the neo-conservative arguments about saving jobs to maintain a minimum wage that cannot sustain workers at a subsistence level. The deep anti-labour, anti-black animus that pervades all the major legislation promoted by the Clinton administration is the result of presidential initiatives not the result of caving in to rightwing pressures. The welfare-forced labour legislation, the crime bill, inaction and opposition to increases in the minimum wage are all part of the Clinton agenda, which the administration takes credit for and showcases to conservatives and stock market investors.

Clinton's anti-labour and pro-big business commitments were most clearly evident in the massive aggressive campaign his administration pursued in securing NAFTA approval. With US society deeply divided, and a majority of working people opposed to NAFTA, the Clinton administration put maximum pressure on Congress people that surpassed anything organised by the republicans and its major corporate beneficiaries. With most industrial communities adversely affected by corporate moves to low wage areas and big business clearly benefiting from greater opportunities to profit overseas, Clinton clearly was marking the pro-corporate character of his regime.

Neither Bush nor Reagan had shown anywhere near the capacity or willingness to engage in the strong-arm tactics that Clinton demonstrated in serving big business overseas interests. The Clinton's neo-conservative initiatives clearly reflect the will of the new democrats to outcompete Reaganite republicans as the most consequential supporters of overseas expansion while maintaining a law and order regime at home.

FROM NEO-CONSERVATIVE INITIATIVE TO "CAVING IN"

The Clinton neo-conservative policies reinforced the rightwing forces in the US, strengthening their capacity to intervene in areas where the Clinton administration initially proposed social reforms: pensions, health care, and public lands.

Clinton's forceful signals of pro-business favouritism encouraged corporate businesses to accelerate the elimination of employer-sponsored pension plans, shifting the payment and responsibility to wage workers. By the end of the Clinton administration, only a fraction of workers will be covered by corporate-financed

pensions, with the active or passive acquiescence of the Clinton administration.

Clinton's pro-business stance is a principal reason why the national health plan has not only been scuttled but is actually being used to reduce federal outlays for Medicaid and Medicare. As universal coverage disappears, Clinton has indicated an increased support for cutting medical funds for the poor and aged to cover a fraction of those who have no coverage.

Clinton's caving in on health care reform is the inevitable consequence of his defence of big business on NAFTA, crime and welfare reform: the rightwing agenda has unleashed social forces which undermine the limited health reforms of the administration. Business has no sense of reciprocity. It is not willing to trade off a series of major concessions from the Clinton administration in exchange for supporting a health programme that entails increased employer responsibilities.

Once Clinton defined his political agenda as promoting overseas expansion, reducing the budget deficit and cutting back social welfare spending, business has merely carried these policies to their logical end, opposing any new social payments and shifting the burden of health insurance from one sector of the poor to another. Clinton's adoption of the compromise on health legislation with its emphasis on holding down federal costs, not extending health coverage, is consistent with his other socio-economic initiatives. The policy of fiscal conservatism and trickle down economics is being played out in the health legislation: less federal expenditures and incremental increases in coverage. The net result is not an improved health package but a cheaper health bill with reduced coverage and less quality care for those under current Medicaid and Medicare plans.

A similar process has taken place in relation to public lands and their exploitation by mining and cattle corporations. The initial policy was to reform existing exploitation by limiting areas and increasing rental fees. In the end, Clinton's neo-conservative allies on NAFTA, minimum wage restraint, forced workfare, and the repressive crime bill redefined the public land policy to suit the corporate interests: land allocations, land rentals are more or less in line with traditional state policies.

CONCLUSION

Clinton, because of his democratic credentials and populist rhetoric, has been able to do what neither Reagan nor Bush were able to do: shift the debate on social policy from social welfare to police repression, from blaming corporate institutions to blaming blacks for urban decay, from providing minimum care for

single parents and children to forcing them to work for subsistence wages without adequate child support systems.

It should not be surprising that Clinton's popularity is declining among blacks, working people and ecologists who voted for him. Even as publicists for the Clinton administration trumpet their economic successes, rising profits and stock market indices, economic growth and the addition of 4.5 million jobs, they fail to understand that these successes are precisely the *causes* of popular disenchantment. This is not because of a perverse incapacity to appreciate good tidings, but rather because these successes are the result of declining living standards, losses of well paid, white and blue collar employment is not compensated by the growth of low paid, temporary service jobs. Increased spending on police and prisons and more death sentences mean more repression against minorities while the free trade agreement means more job flight to Mexico. It was more than a symbolic coincidence that Clinton introduced his crime bill precisely at the moment when NAFTA was passed: more repression is needed to contain the fall-out from more factory closings. Forced work, the mis-named welfare reform legislation, is not likely to please poor single parents when the jobs offered and the child-care facilities fail to meet poverty levels of income. The apparent paradox of economic success and popular disenchantment is resolved if one understands that different classes, races and genders are the winners and losers.

The Clinton Right-turn, however, does not create a new basis of support on the right. The affluent classes and corporate interests, while benefiting from Clinton's largesse, have their own representatives to further pursue their agenda. Taking advantage of the opening on the right they want now to proceed further along, decimating existing health, welfare, pension and likely social security programmes. If Clinton dared to go beyond Reaganism, the conservatives are now willing and able to go beyond Clinton's version of a business agenda.

Clinton's Wall Street populism is the politics of falling between two chairs—losing popular support without gaining adherents among the affluent classes. The main point, however, is that while Reagan and Bush are out of office, Reaganism is doing very well, thank you.

The rupture with Reaganism cannot begin to take place in a Democratic party deeply embedded in this new model of capitalism that reduces domestic social programmes to hasten capital accumulation and global investment. To reverse Reaganism requires not only a change in the political regime, but a change in the structure of the US state and socio-economic system.

Beyond Alterity

Vinay Lal

The Rhetoric of English India by Sara Suleri; University of Chicago Press, Chicago; 1992; pp ix + 230.

IT is with a frontal assault that Sara Suleri, who established her reputation of few years ago as a formidable writer of English and a major voice in the literature of the south Asian diaspora with a finely nuanced memoir entitled *Meatless Days*, begins her new study of "English India", a work that she locates "within the discourse of colonial cultural studies" while questioning some of the assumptions which have governed that discursive field. Suleri argues that the study of colonial discourse has been too bound to the idea of otherness, to the binarism of east and west, female and male, colonised and coloniser, to allow the decentring of master-narratives to which it aspires and which has been so critical for the arguments now associated with post-modernism and post-coloniality. No doubt the idea of alterity was indispensable to the formulation of a critique of the ideology and epistemological imperatives of the coloniser, and as Suleri would hardly deny, the brunt of historical and literary scholarship before the advent of 'colonial cultural studies' did not have the political edge that most sensitive readings of colonialism are able to furnish today. Nonetheless, the binarism in the study of colonial discourse has obfuscated the "necessary intimacies that obtain[ed] between ruler and ruled", which created a "counter-culture not always explicable in terms of an allegory of otherness", much as it has occluded an awareness of the fact that 'colonial cultural studies' is beset by its own binarisms, such as "the assignation of 'cultures' to colonialism; of 'nation' to post-colonialism" (pp 3-7). Suleri maintains that "to interpret the configurations of colonialism in the idiom of such ineluctable divisions" is to overlook and deny the "impact of narrative on a productive disordering of binary dichotomies"; the overdetermination of difference hides the "anxiety of empire" found in colonial and post-colonial imaginations (pp 4-5).

Suleri rounds up the usual suspects – Kipling, Forster, Naipaul, and Rushdie – and a few more, most surprisingly Edmund Burke, by way of furnishing more detailed readings of her argument. If Burke was to point to Warren Hastings as a man obsessed with power, driven by greed, a monster who never dined "without creating a famine" (p 64), the trial of Warren Hastings

was routinely summoned in the colonial record as an instance of the unique capacity of Britain (and the west) for self-criticism, of Britain's adherence to norms of justice and fairness and its impulse towards decency, and of the colonial power's mechanisms for safeguarding itself against its own excesses. In the conventional reading, Hastings and Burke, men of passionate intensity, appear as largely opposed figures: while Hastings is shown as being intent on plundering India, and on laying the foundations for British rule in India, Burke is described as being committed to the preservation of India's ancient institutions, eager to introduce accountability into the regime of colonialism, and even prepared to believe in the ability of Indians to govern themselves.

It is this picture of Hastings and Burke as implacable antagonists that Suleri, in the first instance, seeks to disrupt. Burke never offered a critique of colonialism, and he was more inclined to view the failures of Hastings and his associates in crime as excrescences upon a system that held out the promise of doing good: as Suleri puts it, his impeachment proceedings were compromised by Burke's inability to realise that "Hastings's misdeeds were merely synecdochical of the colonial operation" (p 52). Colonialism was a larger enterprise than Burke was willing to allow, not reducible to the person of Hastings himself or even to the institution of the East India Company, and a truly meaningful prosecution would have required the levying of charges "for which no language was ready" (p 55). Burke's interest lay in making colonialism accountable, by which he meant that the East India Company was to dispense with the subterfuge of functioning in the name of the Mughal Emperor, as well as commensurable with Indian customs, traditions, and modes of governance. He was more interested in the preservation of authority than in exposing abuses of power, and he could not countenance, in the language of his famous work on the French Revolution, "the cashiering of kings".

In Suleri's account, Burke begins to emerge as a figure uncannily similar to Hastings, but she goes much further than that, principally by focusing on the trope

of the 'sublime', which seems to have had, in the 18th and early part of the 20th centuries, as wide a currency as did the tropes of 'wonder' and the 'marvellous' in the 15th and 16th centuries. Burke employed the trope of the sublime to render India obscure: he was to insist on the unreadability and unknowability of India, a land – "a very remote object" – that could not be represented through the English language, and that could be viewed only through "a very false and cloudy medium" (p 27). Drawing on the work of Donald Pease and others, Suleri argues that the sublime has always had an association with conservatism, and Burke turned "the sublime on its head in order to represent India as a catalogue of the uncategorisable" (p 28). Indian 'intransigence' allowed Burke and India's colonisers to advance the idea that, far from being the object of Britain's colonialist aspirations, India was positioned to contain the British and, as it had with previous conquerors, absorb and tame them. If the native was unknowable, he was always in a position to strike at his purported masters and to be impermeable was to be in a position of empowerment; on the other hand, intransigence demanded that India be rendered less obscure, and this inspired the "colonial will to cultural description". The terrain was to be thoroughly surveyed and mapped; each Indian was to be counted; and vast compendiums of Indian customs and traditions were to be commissioned. It is this same will to description, this institution of a regime of truth, that inspired the People of India project, a photographic record that proposed to provide a specimen of each race and caste to be found in India, as well as Burke's catalogue – a device used to great effect by his contemporaries like Swift to convey the notions of the absurd and otherness – of Indian geography (pp 29, 103-10).

More than Hastings, Burke appears to have rendered India into the other. Suleri's intent here is not to reinforce the importance of otherness in colonial cultural studies, but rather to see how Burke, the 'friend' of India, was complicit with Hastings, his purported opposite, in the colonisation of India. No doubt Burke had "sympathy" for Indians, but as Suleri shows, Burke's own work on the sublime suggested that "sympathy... is a dynamic of alienation rather than of association" (p 38). Ultimately the trial, as she maintains, was scarcely a "battle between East and West", and its "most significant influence occurs troublingly elsewhere, and even there, offstage" (pp 66-67). This is a point that Suleri could have pursued further, for many

of the debates purportedly about colonialism, about 'us' and 'them', were often masking other concerns. Burke was evidently more concerned, for example, about the effect of the ill-begotten riches of Hastings and other nabobs on English politics, the diminishing influence of the aristocracy, and the consequences of the entry of plebeians into the political life of England than he was about the political future or cultural life of India.

The idiom of otherness, Suleri argues, simply rehearses "the colonial fallacy through which India could be interpreted only as the unreadability of romance", "the language of alterity can be read as a post-modern variant of the obsolescent idiom of romance" (pp 11-12). British women in India, while "implicated in the structures of colonialism", were themselves victims of confinement (p 76). In some respects, indeed, Indian women appeared to have the edge over British women. The 'zenana', the women's quarters to which Indian women were confined, included children within its space; by way of contrast, throughout Anglo-Indian narrative, as is well documented, the separation of mother and child appears as "a sentimentalised motif that repetitively reveals the extent of its traumatic betrayal" (p 80). More troublingly, certain Indian women, such as nautch girls, were held to exercise an undue influence even over men bought up in England. These nautch girls, or courtesans, uncomfortable reminders of the fact that English women had been imported to perform the same function that Indian courtesans served to provide, were for British women a source of "a fear of proximity rather than of difference", and this fear was transformed "into the obscure discourse of the picturesque" (pp 77, 92-93). Through the picturesque, British women travelling in India, such as Harriet Tyler and Fanny Parks, while condemned to remain on the periphery, and compelled to sustain "the psychic strains of self-censorship" (p 75), could nonetheless "transfix a dynamic cultural confrontation into a still life" (p 76).

Most strikingly, it was the Anglo-Indian woman who appears to have been engaged in "an incipient questioning that dismantles colonialism's master narrative of rape", and who understood the imperial dynamic "as a dialogue between competing male anxieties" (p 77). Without seeking to deny the place of rape in the terrain of colonialism, Suleri is, however, critical of the "unquestioning recuperation of the metaphor of rape", noting that for too long this "dominant trope for the act of imperialism" has served "as a subterfuge to avoid the striking symbolic homoeroticism of Anglo-Indian narrative" (pp 16-17). In the depiction of the colonised

as a violated female body, the discourse of otherness is given full play, and the binarisms – male and female, coloniser and colonised, white and black – within which the discourse, pivoted upon the metaphor of ravishment and possession, is encapsulated conceal the fact that the figure of "male embattlement... more authentically dictates the boundaries of colonial power" (p 61). Thus, while most of the critical gaze has been turned upon Aziz's alleged ravishment of Adela in *A Passage to India*, Suleri points to the presence within the text of an "alternative colonial model the most urgent cross-cultural invitations occur between male and male, with racial difference serving as a substitute for gender" (p 133). Suleri finds the embodiment of homosexual desire in the famous scene where Fielding borrows Aziz's stud collar, and – less predictably – in the scene where Aziz takes him into his confidence, allowing Fielding to have a look at his deceased wife's photograph, and thereby lifting the veil within which the Indian woman must otherwise be confined (pp 138, 142-43). But the novel enacts a more complex reversal of the metaphor of ravishment: when Adela takes too literally Aziz's casual and wholly unintended invitation to visit him at home, we are witness not to the male possession of a "feminised territory", but to the rather more unfamiliar scene of a female seeking to make an entry into "the habitat of colonised domesticity", thereby pushing Aziz, "the little Indian", into changing the venue of that meeting to the "exotic but empty space of an unvisited cave" (p 139). The centrality and intensity of male desire, Suleri goes on to argue, determines "the confluence between colonial and post-colonial stories", a point that she seeks to establish through a complex interpretation of Rushdie's *Satanic Verses* (p 195).

Suleri's reading of colonial texts as enactments of homoeroticism is largely persuasive but not without its problems. If there is a colonial trope, *effeminacy* was certainly one, and the Indian male, when he was not a member of one of the so-called 'martial races', was bound to appear in the colonial text as a rather delicate creature. So is Aziz, the quaint native, he is described by Forster as being "daintily put together", and in the courtroom Adela saw her alleged ravisher as a "strong, neat little Indian with very black hair and pliant hands" (p 136). That Suleri should leave the possible association between homoeroticism and effeminacy in colonial discourse unexamined is quite inexplicable. Secondly, she naturally recognises that Forster's "own curiously [why 'curiously'?] class-conscious and cross-cultural homosexual experiences" may have contributed to the "homoerotic strategy" of the novel, but

that detail is dismissed a trifle too easily. Kipling's life also appears to have been shaped by a latent homosexuality, and in any case it is rather surprising that Suleri makes no mention of the sensitive rereading of Kipling furnished by Ashis Nandy (1982), who has also been among the first scholars to alert us to the nervousness of masculinity generated by colonialism, besides pointing to the difficulties with the trope of otherness when the colonisers and colonised were bound together by common anxieties. Thirdly, as a large part of feminist discourse, with which Suleri has undoubtedly an extensive familiarity, has already argued with considerable force and clarity, much of colonial discourse is to be read as a communication between men. This discourse was often conducted over the bodies of women: thus the overdetermined metaphor of rape almost invariably layered another politics, the politics at once of desire and domination.

It is, in the last analysis, to Suleri's critique of otherness, to the prevailing hegemony of the trope of alterity, to which we must return. That is certainly the signal contribution of this most difficult book, a work of powerful if excessive elegance. Suleri moves, in the *Rhetoric of English India*, from the 18th century figure of Burke to the post-modern figure of Salman Rushdie, and this obedience to temporality, in a work that otherwise bids farewell to conventional readings and predictable structures of narration, is somewhat disconcerting. If colonialism is not contiguous with the actual exercise of domination, existing long after the colonisers have departed, and post-colonialism is complicit with colonialism, then does colonialism get inaugurated only with the formal institution of empire? Despite Suleri's strictures against Benedict Anderson's *Imagined Communities* (p 7), her own book suggests that she has not entirely liberated herself from viewing modernity as a movement of temporality. The question of temporality aside, the last chapter on Rushdie suggests that alterity is already a diminishing trope in what Suleri describes as "colonial cultural studies", for the location from which we speak, as post-colonial critics have been arguing, is critical to the determination of the politics of our utterances. *The Rhetoric of English India* remains, in any case, one of the most enduring testaments of a "colonial cultural studies" imbued with a more enhanced degree of self-reflexivity about its own practices.

Including North-East in Nation's History

Sajal Nag

Social Movements in Manipur by N Joykumar Singh; Mittal Publishers, New Delhi, 1992; pp 162 + xii, Rs 190

IT is remarkable that in recent times, many communities of north-east India, big or small, have understood the importance of historiographical practice and are making serious efforts at the reconstruction of their own respective histories. The output has not only succeeded in enriching and diversifying India's past but even challenged the dominance of 'mainstreamist' historiography. Indeed, north-east India hardly ever finds any mention in the textbooks of Indian history, most of which subscribe to the above school. Manipur has been a bit fortunate in this regard. Jawaharlal Nehru's accidental involvement with the Gaindinliu story brought the movement led by Jadonang – Gaindinliu in Manipur into national focus. Similarly, the Kuki and Kacha-Naga uprisings were accorded recognition due to the new found enthusiasm in 'history from below'. But Manipur still had a lot more to tell to the rest of India in terms of what can be characterised as 'social movements'. N Joykumar Singh's book under review details these fascinating succession of events in a very simple and unassuming way.

Intimidated by the expansionist designs of the Burmese, Manipur was compelled to seek the assistance of the British who entered the state in the guise of saviour but refused to back out. Although theoretically Manipur had an Indirect Rule, its subjugation was complete. The subordinating of this subsistence economy to a vicious colonial order created immense strains and a series of crises which was reflected in the outbreak of a succession of revolts against the system. Within 13 years of its occupation by the British, the first uprising took place in 1804. The next 15 years saw the kukis rise in revolt (1917-19) led by a miracle worker. The kukis fought a guerrilla war against the British for about two years before being crushed. The turn of the decade saw the Kubui Nagas up in arms led by Jadonang who professed to possess supernatural power. The battle was carried by Gaindinliu after Jadonang was executed. While in all these cases the objective was to reinstate their 'own rule', the backdrop was provided by the colonial rule, imposition of taxes, demand of soldiers and labourers from the tribals and the Christian missionary activities. The Nuplan movement (1939) was launched by Meitei women against the unscrupulous 'Mayang (outsiders) traders who exported local

foodgrains to meet the war time demands. The Irabat's movement (1946-51), a Telengana-like uprising, attempted a communist *coup* in Manipur, to overthrow the autocratic king and establish a peoples' republic. Irabat also launched a state peoples' movement for a responsible government. Joykumar Singh details the hurried manner of the Indian state in securing the merger of Manipur through threats and baits, completely ignoring the elected representatives of the people and thereby, irreparably hurting the collective pride of the people of Kainglaupak (Manipur's local name).

The author starts with a theoretical discussion of the concept and typologies of social movements which could prove beneficial to the students. His attempt to characterise the various movements that took place in Manipur as 'tribal', 'women', 'political' and 'revolutionary', can be debated about. But the concept of social movement itself is so fluid and accommodating, that venturing into any such debate might lead to the loss of historical importance of these movements in the morass of terminologies and parameters. However, Singh is right in pointing out that though *Nuplan* was a women's movement, it was an anti-colonial movement without any feminist ideology. But the negation of the revolutionary content of the kuki and Zeliangrong movements by labelling them as tribal movements might not be acceptable to all. The author also fails to convince how the Jadonang-Gaindinliu movement can be called 'Zeliangrong' movement (p 57) since the latter was a post-independence phenomenon. Such a classification reflects a particular political position. Similarly, it is erroneous that Gaindinliu movement attempted to be a part of the Indian national movement (p 63). The available evidence suggests that Gaindinliu had no idea about the Indian national movement. She had only heard about Gandhi's endeavour to expel the British from the area, a possibility she rejoiced. Although the author has provided vital statistical information regarding the background of the movements (pp 76-80), he fails to trace the continuity and change in these successive outbursts. Lack of analytical endeavour is responsible for this lapse. The book is a plain narrative. Perhaps the most important aspect the book misses is to delineate the regional developments against an all-India backdrop.

Such an approach would have provided us with a vital comparative overview and spared the author from making statements, such as, "the Kuki and Zeliangrong movements were entirely different from other tribal movements of India" (p 43). A careful study indicates the opposite. The author's reluctance to perceive the developments of Manipur as a part of the all-India phenomenon prevents him from pinpointing the circumstances that constituted the background of the forceful merger of Manipur with India. Irabat's communist *coup* in Manipur took place when throughout the country there were communist-led uprisings that created a communist phobia in the Indian state. The rising of the 'red sun' in China and Burma gave an international dimension to it. In other areas the Indian state had used the state peoples' movement to effect the merger but in Manipur it did the opposite. Only a careful analysis would have brought out these significant points. The author also makes contradictory statements like "Manipur was able to withstand any onslaught due to [the strength of] its political and cultural character" (p 20) when his study shows that Manipur was neither able to withstand the cultural attack from Hinduism nor the invasions of Burma or the British. The author notes that Manipur had a rich historical tradition and distinct cultural identity (p 20). But he refrains from any comparative study which would have shown the distinctiveness of Manipur's political and cultural identity. The book also wrongly mentions that the hill-plain divide was a creation of the British (p 38) when in fact it was a continuation of the policy followed by the Meitei kings. There are also examples of unwarranted value judgments like "the Lallup system [a kind of semi-serfdom] was good for Manipur" (p 29). These issues are stressed because in the long run they have political implications. Regional historiography should not be regionalist in outlook. K M Panikkar has already cautioned us against the glorification of regional specificities or events that lead to false pride.

The author's claim that no substantial study has been done on these movements is also not quite correct. Apart from Sumit Sarkar's *Modern India*, Ranjit Guha's subaltern series, A R Desai's volume on peasant movements, K S Singh's volumes on tribal and social movements, there are at least 10 unpublished dissertations and published works (mostly from Manipur university itself) dealing with these movements. However, it must be said to the credit of the author that he has supplied enough material for the authors of the textbooks on Indian history or for a historian working on national history to include the north-east in their forthcoming volumes.

Intellectual Property Rights in the Uruguay Round

An Indian Perspective

D M Nachane

The recently concluded Uruguay Round has ushered in a new era of strengthened intellectual property protection. This is likely to have several consequences for LDCs, not all of which are transparent. The main focus of our paper is to examine these consequences. Special attention is also given to the specific areas in the Indian patent system where modification will be necessary and to how such modification will affect the economy at large. The pharmaceutical and biotechnology sectors are analysed in greater detail. The threat of trade retaliation is examined in the early part of the paper and the penultimate section examines the seriousness of this threat from India's point of view.

I

Introduction

PHILOSOPHICAL attitudes to Intellectual Property Rights (henceforth IPRs) have historically ranged between two extremes – on the one hand we may distinguish the so-called natural rights view of the IPRs, best encapsulated in the Hegelian dictum that “an idea belongs to its creator because the idea is a manifestation of the creator's personality or self” [Hughes 1988], on the other, there is a utilitarian view stressing the role of innovations in promoting industrialisation by local diffusion of knowledge [Anderfelt 1971 and Machlup 1958]. National IPR laws usually embody aspects of both views, with ‘strong’ IPR regimes setting greater store by the natural rights viewpoint and ‘weak’ regimes emphasising the other end of the spectrum. The deliberations attendant upon the recently concluded Uruguay Round witnessed a marked polarisation of views on IPRs with the industrialised west, spearheaded by the US, taking up the cudgels for strengthening IPRs globally and the third world countries offering spirited resistance to the US initiatives. The final outcome represents a definitive victory for the industrialised countries’ viewpoint and all indications are that the LDCs will have to go through a prolonged and painful period of adjustment in their national IPR systems in the coming decade.

The primary aims of this paper are two-fold – firstly, to analyse the political economy and institutional factors responsible for the attitudes to the IPRs in the industrialised and developing countries. (The US and Indian cases are for the sake of specificity, taken as representative of the industrialised and developing country perspectives respectively though, of course, it is recognised that some divergence of views within each group is

only to be expected.) The second focus of the paper is more specialised, and deals with the scope and magnitude of adjustment that the IPR regime in India will have to undergo under the imperative of the Dunkel Draft and whether these adjustments will impinge favourably or critically on India's medium-term and long-term economic prospects. Two sectors where IPRs play a crucial role, viz. pharmaceuticals and biotechnology are studied in some detail. The option advanced on some fora in India about “opting out” from the Uruguay Round recommendations is also given some attention.

The organisation of the paper is as follows. The next Section (II) delves into the motivations behind the move to global strengthening of the IPRs initiated by the US. Since this is well-charted territory, the discussion is a bit brief. The LDC point of view, however, is elaborated in greater detail in Section III. The economic impacts of the new IPR regime are discussed in Section IV. The pharmaceutical and biotechnology sectors are studied in Sections V and VI. Section VII is devoted to a critical examination of the “opt out” possibilities. Conclusions are gathered in the final Section (VIII).

II

Industrialised Countries' Viewpoint

The most prevalent methods of intellectual property protection are (i) patents, (ii) investors' certificates (a form of non-exclusive patent commonly used in the ex-centrally planned economies), (iii) plant breeders rights (a patent-type protection afforded to traditionally bred plant varieties), (iv) copyrights, (v) trademarks and (vi) trade secrets. Of these instruments, patents have figured most prominently in the IPR debate, and most (but not all) of our discussion will

pertain to this particular mode of intellectual property protection.

CHANGING TECHNOLOGY CHARACTERISTICS

One of the primary reasons responsible for the movement in favour of stricter global IPR regime gaining currency in the developed world, is to be sought in the fundamental changes in the character of technology which have occurred in the past two decades.

(i) Firstly, and perhaps most importantly, as highlighted by Freeman (1974), Mytaka (1987) and Kaplinsky (1989), the knowledge intensity of production has increased and simultaneously so has the science-content of knowledge. These twin developments have had several important ramifications, which impinge critically on the issue of IPRs. Thus, as knowledge intensity has grown, the individual inventor has been replaced by the corporate entity, and growing scientisation has increased the optimal plant size, implying scope for exploitation of scale economies (very often by transcending national boundaries). Thus intellectual property protection is no more being sought by scattered individual innovators but by mega-corporations and transnational enterprises. This is particularly true of the pharmaceutical and biotechnology sectors.

(ii) Secondly, the post-1970s have also witnessed a major transition from mass production to flexible specialisation, brought about by the instability in global markets [Piore and Sabel 1984]. This had the consequences of shifting the focus from price competition to product characteristics and design in the arena of international trade. With commodity design becoming the kingpin of the competitive process (especially in commodities such as garments and footwear), the protection accorded to innovative designs assumed

central importance. Since such protection is usually weak in LDCs and further, since the main innovations in design are centred in the developed countries, there is natural tendency to strengthen IPRs in this direction in the latter group of countries.

(iii) The 'electronics revolution' has also called into question some of the traditional approaches to IPRs and their protection. The pace of diffusion in electronics is quite rapid, imitation is often costless and difficult to prove and duplication via reverse-engineering can be relatively easy (semiconductors being a particularly striking example). Thus technological leakage (both domestic and transnational) is common and hence, affected interests in industrialised countries have been quite active in lobbying for stronger protection. Largely as a result of the pressure exerted by the film and recording industry as well as the computer (hardware and software) industry, the US Copyright Law was amended in 1976 to broaden the coverage of copyright to include music, films, choreography, computer programmes, spreadsheets, etc. Since the period of protection under the US Copyright Law is 50 years plus the life of the author, the protection afforded is, in fact, substantial and fears have been expressed about the adverse impacts of such legislations on the diffusion of ideas in an area of rapid growth possibilities. In the field of semiconductors, the protection was similarly strengthened via the US Semiconductor Chip Protection Act of 1984 whereby semiconductor topography was accorded protection for 10 years.

(iv) Perhaps the most striking technological development of the past few decades has been biotechnology whose vast potentials have not yet been fully realised. Butt et al (1985) have identified the following main thrusts of biotechnology which are likely to have a significant impact on agriculture and health, in both, industrialised and developing countries (a) plant genetic-manipulation and breeding, (b) industrial tissue-culture, (c) embryology and hormonal implants and (d) the genetic manipulation of micro-organisms to substitute for existing agricultural products.

The biorevolution poses several problematic issues for IPRs. Firstly, most national patent systems do not provide patents for micro-organisms (the US is an exception), but the peculiar feature of biotechnology is that considerable resources need to be devoted to identify micro-organisms and in the absence of adequate protection, investment in this activity is likely to fall short of the social optimum. Secondly, in contrast to other sciences, the link between the scientific origin of an idea and its commercial exploitation is direct, and the time lag between invention to innovation is negligible. The 'disclosure requirement' of

the traditional patenting system may thus prove to be an inducement for illegal duplication – hence the demand that the disclosure requirement be met by a deposit of the micro-organism. Further aspects of the IPRs in biotechnology will be discussed in a later section.

The preceding discussion highlights two important facts, viz., that substantial technological changes have occurred in the past two decades, which necessitate revision in the traditional approach to IPRs, and that almost all of these developments have occurred in the industrialised part of the World, especially in the US. It is then no wonder that a large part of the initiative to strengthen IPRs across the globe has come from that country.

US IMPERATIVES

The US goals in the Uruguay Round may be formally described as (i) the achievement of a comprehensive and self-actuating agreement on TRIPS to replace the current method of dispute resolution in this area via *ad hoc* country-specific approaches and (ii) to legitimise the linkage between IPR issues and the global trading system, or putting it more plainly, to make trade sanctions a powerful weapon to bring erring countries in line with the US viewpoint on TRIPS. While the mechanism by which these goals have been sought to be achieved are well known (and will be briefly described below), a satisfactory analytical framework to explain the US position is lacking, though UNCTAD (1990:59-156) presents certain tentative guidelines in this regard. The UNCTAD model is predicated on two fundamental principles – the product-cycle theory of international trade [Vernon 1971 and Kurth 1979] and the hegemonic-stability theory of international relations [Gilpin 1987].

Vernon's (1971) product-cycle theory is, of course, well known to economists. Nevertheless, with a view to maintaining the continuity of our discussion its key elements can be briefly re-stated. The four stages in the life-cycle of a product are identified as (i) innovation and introduction in the domestic market, (ii) saturation of the domestic market and the search for foreign markets, (iii) foreign investments by the industry for the provision of the product in foreign markets and (iv) exports of the product from the foreign countries to the original home market. While Vernon presumes that the innovating transnational corporation would remain in control of all the four stages of the product-cycle, in the absence of strong IPR protection abroad, the last two stages might well be appropriated by foreign imitators. The UNCTAD report underlines the strong possibility that the transnational corporation would be impelled to lobby its government to press for stricter

IPR regimes both at home and abroad. The domestic implications are examined a bit later, but we must note here that pressurising foreign governments is an effective option only for a hegemon. The theory of hegemonic stability maintains that the global leadership and enforcement functions usually devolve upon the hegemon (if one exists), and as a logical implication, markets will be relatively open in the presence of a hegemon and relatively protectionist in its absence – a hypothesis well-supported by the experience of Britain in the 19th century and of the US in the post-second world war period. But the hegemon that seeks to establish an open market for goods also will seek to establish closed markets for intellectual property. Further, concern with free trade in goods is likely to be paramount when the hegemon is in a strongly competitive position (i.e., when most of its industries are in the first three stages of the product cycle), whereas IPRs become the dominant concern when the hegemon is losing its competitive edge with the bulk of its industries in the last stages of the product-cycle. The UNCTAD report thus attributes the hardening of the US stance on IPRs in the 1980s to its declining competitive status. Interestingly the theory also attempts to explain the use of trade retaliation as the favoured instrument in seeking stricter IPR enforcement – the losing competitive edge by the hegemon means that foreign imports claim a large share in its own market so that the economic weakness of the hegemon become precisely its political leverage.

The weaknesses of the above theory stem from the inadequacy of the product-cycle model as a theory of international trade. Currently the accepted paradigm for explaining trade-flows seems to be the intra-industry trade theory, at least where trade between advanced countries is concerned. Even in trade between advanced and developing countries, the product-cycle theory runs into several difficulties. If the products in question are durable consumer goods, then several LDCs (e.g., India) severely curtail such imports, and investment from abroad in the production of these goods is also restricted, so that the product-cycle is not allowed to operate in such cases. In the case of capital goods also, it is doubtful whether the product would go through all the four stages identified by Vernon (1971). In particular, it may be difficult for an LDC to export a capital good to an industrialised country, even after its production has attained the "routine" stage for the simple reason that low wages (on which Vernon rests the major part of his argument) may not be sufficient to lend the LDC a competitive advantage – the capital good in question may depend on other resources such as capital, skilled labour and scientific inputs in which the LDCs may not have

any cost advantage at all. Further even if the LDC could press home a cost advantage, it is difficult to envisage whether any market at all would exist for such a capital good in an advanced country in view of the rapidity of technological change and obsolescence in the latter. Anyway, on the empirical plane, LDC imports have had difficulty in maintaining, leave alone increasing, their market share in the industrialised countries. Thus the UNCTAD (1990) theory does not furnish a very satisfactory explanation of the imperatives behind the US stance, and alternative explanations have to be sought for.

The major contribution of the above theory, however, is that it highlights a crucial fact, viz, that the interests of a national economy in IPRs evolve over time, and are a function of its internal economic and political situation. The precise status of its national IPR regime will be the outcome of conflicting interests between the innovators and imitators and other groups in society, as resolved through the political process. As innovation proceeds apace, the interests of innovators would dominate that of imitators, so that in the early stages of development a nation might favour weak IPR regimes (witness the US non-participation in international copyright arrangements for the first 100 years of the system's existence), but in the later stages of development, the same nation would advocate strengthening of IPRs. Apart from imitators and innovators, other interests are also affected by the status of the IPR regime—consumers, agriculturists, and organised labour but following Olson's (1965) theory of collective action, the influence exercised by such groups would depend upon their capacity for effective organisation and this capacity would show considerable intertemporal and cross-national variations. This point will be resumed again in the discussion bearing on LDCs in the next section.

US POLICY INITIATIVES

US concerns about IPRs have found outlets both in its bilateral relations with other countries as well as in its initiatives on multilateral fora such as the OECD, WIPO and most especially GATT. The US led initiatives in GATT have largely succeeded in establishing a new world order, more attuned to the advanced countries' viewpoint, and under such circumstances a legitimate concern is bound to emerge in LDCs as to whether the bilateral initiatives have become superfluous, especially in view of their questionable conformity to the GATT legal framework [GATT 1989]. The minimum that the LDCs may expect is a soft-pedalling on some of the bilateral initiatives, which have been particularly severe in the last five years.

The main bilateral initiatives are (i) Section 337 of the US Tariff Act of 1930 as amended in 1988, (ii) Section 301 of the US Trade Act of 1974 as revised in 1984 and 1988 and (iii) the Super 301 and Special 301 mechanisms created by the Omnibus Trade and Competitiveness Act of 1988. These sections provide for various measures of retaliatory action by the US on the trade front mainly, as a counter-check to violations of IPRs in other countries and have been invoked quite regularly (mostly against LDCs) since their coming into effect [UNCTAD 1990 and Kaplinsky 1989 for details].

III

The LDC Viewpoint

SCIENCE IN LDCs

In his classical perspective on the history of science, Bernal (1970) distinguishes two phases in the development of relations between science and economic development. An early phase in which scientific discoveries originated from the study of production technologies and a later phase in which basic science became the source of technological innovations—in chronological terms the first phase coincides roughly with the early stages of the industrial revolution in England, the second starts with the emergence of electrical and organic chemical industries. Further, Bernal demonstrates that in any society the links between science and production evolve as a result of the historic process of development of economic organisations. Building on this premise, Herrera (1972) theorises on how and why in LDCs most scientific research is irrelevant to national goals like defence and economic development, whereas in advanced countries R and D is much more goal-oriented. While enumerating all the links in Herrera's chain of analysis would take us far afield, some of his major observations merit noting: (i) LDCs tend to spend much more on basic research than on applied research, whereas in advanced countries the situation is exactly the opposite, (ii) whatever applied research exists, (in LDCs), usually occurs in a fragmented fashion with few links to industrial production, (iii) basic research can be sometimes of very good quality but such research is likely to be connected to the scientific systems in advanced countries and the centres of excellence in basic research are usually likely to be isolated enclaves with little bearing on local R and D and (iv) the problem in LDCs is not so much the low level of R and D (as is usually supposed) but the fact that this R and D is not properly embedded in the national structure of production. Some of these observations have an important bearing on the discussion that follows.

PARADIGMS OF TECHNICAL CHANGE IN LDCs

To appreciate the attitude of LDCs to intellectual property, it is important to study the perceptions about technical progress and economic development in these countries. The dominant paradigm in this regard in the early 1970s was the so-called 'dependency school' originating in Latin America with heavy overtones of the Marxian theory of imperialism [Furtado 1964, Warren 1980, Fransman 1985]. According to the dependency school, LDCs tend to veer towards technological dependence on industrialised countries due to a combination of factors, chief among which are (i) the income distribution is overwhelmingly skewed in favour of the upper classes, who dominate consumer goods markets, (ii) the elite demand the same kinds of consumer goods as prevail in the developed countries due to the operation of the 'demonstration effect', (iii) the manufacture of such goods is accomplished via imports of technology from the industrialised world (in the form of industrial inputs and machinery) and (iv) the necessary foreign exchange for such imports is obtained by exporting primary products.

Several corollaries follow from these basic tenets of the dependency school:

- (i) TNCs become the dominant suppliers of technology to developing countries;
- (ii) The terms of technology supply create conditions for the flourishing of monopolies in developing countries;
- (iii) Such monopolies exhibit no technological dynamism of their own; and
- (iv) Technical innovation in the developed countries is of the labour-saving, capital-using variety and is inappropriate to the factor endowment situation in LDCs [Stewart 1972].

The last proposition is particularly germane to the theme of our paper and underlies the strong opposition to a stiffer IPR regime among the LDCs, expressed in a series of initiatives at the UN [beginning with the Brazilian resolution in 1961 seeking revisions to the Paris convention and followed by similar resolutions at Nairobi (1981) and Geneva (1982, 1984)]. It is worth noting that several developed country economists have also questioned the relevance of a strong IPR regime for LDCs. Both Penrose (1951) and Greer (1973) have suggested that LDCs should be exempt from international patent arrangements. More recently Bifani (1990) has also taken a fairly sympathetic view of the LDC position; commenting on the Uruguay Round negotiations he remarks "It is somewhat ironical that liberalisation of international trade will be now pursued through the growing global monopolisation of one of the most important factors of production, that is knowledge, a process

facilitated by the absence of international agreed antitrust rules".

Even though the early 1970s was a period when the dependency theory held fully sway in the LDCs, by the end of that decade, some of its more rigid conclusions had been increasingly called into question. Stewart (1977) was talking about the "advantage of being a 'late-comer' in terms of development" and Lall (1975) was cautioning that "A blanket concept of dependence applied to all LDCs is quite misleading". By the 1980s, the dependency theory seemed to be in retreat, largely as a result of the economic successes of several third world countries in Latin America as well as the 'tigers' in Asia. Such countries had successfully adapted foreign technology to local factor endowments by pursuing a 'technology following' strategy rather than a 'catching-up' strategy, building up incremental technical changes rather than aiming for major technology breakthroughs. Any theory of technological change and development ought to account for these experiences which did not easily fit into the dependency paradigm. [See Erber (1984) however, for a determined effort to have dependency theory encompass these cases.] The new theory which emerged may be called as neo-Schumpeterian [Freeman et al 1982, Katz 1984, Teitel 1984, Fransman 1985, etc], being fairly close to the original Schumpeter (1934) model in its dynamics but emphasising incremental rather than major technical changes. The neo-Schumpeterian theory stresses the advantages attached to being a 'technology follower' viz. reduced costs of knowledge acquisition and risk-bearing. A quick imitator is usually more economically successful than a pioneer, since imitation (and adaptation) of technology can be based on relatively 'shallow' levels of knowledge, and the crucial factor in technology adaptation may be human resources geared to incremental, rather than basic designing skills.

The implications of the neo-Schumpeterian view for IPRs have not been examined hitherto, but they are relatively straightforward. Those third world countries (like India and South Korea) which have threshold scientific and technological capabilities can successfully resort to a 'technology-following' trajectory and an IPR system which would promote such a strategy would be one which recognised 'minor' or 'utility' patents. Such a plea to reduce the "non-obviousness" requirement in patent applications has been made on legal grounds in India [Ponkshe 1991] but there seems to be strong economic sense in the argument too. In the matter of utility patents, domestic innovators could easily hold their own against potential foreign competition. The grant of patents to

foreigners for major technical changes will then be a matter of secondary importance to domestic innovators, who will busy themselves with 'inventing around the patent'. Thus the opposition to IPRs will be considerably whittled down, once utility patents are recognised.

POLITICAL ECONOMY CONSIDERATIONS

We try to sketch below the political economy type influences shaping attitudes to IPRs in the third world. The discussion is based on the Indian case but several considerations would apply with minor modifications to other LDCs also. The four groups whose interests are vitally at stake in the adoption of the new IPR regime are (i) business sector, (ii) labour, (iii) farmers and (iv) consumers.

Currently India imposes a number of restrictions on technology imports such as restrictions on royalty and lump sum payments, duration of collaboration, etc. An effectively strengthened IPR regime will necessitate some modifications in technology policy, because the domestic importer has always shown a preference for the latest vintage technologies, economising on the royalty payments by going in for smaller technology packages [Alam 1985]. The Indian importer seems to be more concerned about lengthening the duration of the collaboration and being allowed to import first-hand technology than with royalty payments as such. Thus business interests are not likely to set themselves in opposition to the new IPR regime, but are rather likely to agitate for greater flexibility in the government of India's technology policy. (Of course, sectors involved in counterfeiting goods and in illegal imitation are bound to oppose the new IPR regime but this opposition cannot come out into the open). If utility patents are granted, the support of the business sector for the new IPR regime will be secure.

The effects of the new IPR regime on labour are likely, by and large, to be unfavourable at least in the short run. If, as is very likely, a stricter IPR regime brings in its wake a higher level of technology in domestic industry, this technology would be of the labour-saving kind and it would take some time before it is adapted to the native factor endowments. The 1980s, which have been characterised by what has been termed as 'jobless growth', underline the fact that such adaptation of technology may be a long-drawn out process, involving considerable restructuring. A stricter IPR regime might also drive several units in the unorganised sector, which violate patent and copyright laws blatantly, to the wall, and this could also involve considerable retrenchment of labour. Thus labour,

especially the organised component would be in opposition to a stricter IPR regime.

The reaction of farmers is likely to be a function of their holdings. The large- and medium-scale farmers, who have been major beneficiaries of the green revolution, also anticipate benefits, but on a much larger scale from the gene revolution. To the extent that the biotechnology breakthroughs will be accessible to the Indian farmers only if India is a party to the new IPR regime, the relatively large farmers support such a regime. The small farmers however fear an upward spurt in seed prices from the adoption of stricter IPRs, and have been vocal in their condemnation of the GATT agreement. The small farmers may be numerically more powerful, but it is felt that the political lobbying power of the large farmers is much greater.

Finally, the consumers are likely to face steep upward prices of several commodities, especially drugs and other chemical-based products. But they are unorganised and hence likely to be ineffective as opponents of the new IPR regime.

The government of India has already adopted the Uruguay Round proposals in principle, but whether this decision is in accordance with the collective will of the nation, will only be known in the next round of the general elections, when the IPRs issue will certainly be one of the major probits of the voter's decision process.

IV

Likely Economic Consequences of GATT for India

The new regime of IPRs, ushered in by the Dunkel Draft, has virtually stirred up a hornet's nest in LDCs, with its possible economic consequences being discussed at every conceivable forum. Basically one may distinguish two opposing views – the dominant, traditional view which postulates that strengthening IPRs will have deleterious consequences for LDCs and an emerging, but possibly minority view, that such strengthening is an absolutely necessary precondition for the LDCs to be integrated into the global economy and to launch off into a sustainable high-growth trajectory. The quality of the debate has suffered because of inadequate, sector-specific data and some of the empirical work has been undertaken with heroic assumptions, often putting severe strains on econometric etiquette. Nevertheless the debate has served to put certain key issues into focus and pointed to the institutional changes which may be necessary either to mitigate the damages of a strong IPR regime in some sectors or to maximise its benefits in others.

The basic argument for strong IPR protection is extremely simple – that if the returns to innovative activity (which is of essence, a public good) can be better appropriated, this will encourage innovation and thereby productivity and economic growth generally. The argument has sometimes been further simplified by identifying patents as the major safeguard of IPRs, and linking better patent protection with improved manufacturing productivity and growth.

The causal chains in the above analysis are not supported by the available empirical evidence in the developed countries. The important surveys of the US industries done by Mansfield et al (1981) and Levin et al (1987) rank patents, as a method of appropriability of returns on intellectual property, fairly low among various instruments (except in the pharmaceuticals case). Similarly Watanabe's (1985) study of Japanese firms ranks patent protection below inter-firm competition as an inducement to innovative activity. Historical studies of Netherlands and Switzerland [such as those of Schiff 1971] during their patentless years show no evidence of their economic prospects being hampered by their weak IPR protection systems. Thus on balance, the link between IPRs and innovative activity, in the industrialised countries, is tenuous [further details on this point may be recovered from Siebeck et al (1990)]

Similar surveys for LDCs are not available, but even if they were, it is difficult to envisage that the conclusions would be reversed. As a matter of fact, the link between domestic IPRs and domestic innovative activity in an LDC is much less direct than in an industrialised country, because nationals in LDCs hold a very small proportion of total patents (the figure is in the range of 8-10 per cent for India) drawn in that country. It was exactly this consideration which had prompted Penrose (1951) to state "These countries (LDCs) receive nothing for the price they pay for the use of foreign inventions or for the monopoly they grant to foreign patentees"

However an indirect link could still exist between strong IPR regimes in LDCs and their economic growth if (i) such IPR regimes lead to greater innovative activity abroad and (ii) the fruits of such innovative activity result in more rapid or cheaper transfer of technology from industrialised countries to LDCs. There is some evidence to support the first of these contentions in Lipsey et al (1990) who report that US firms investing in production operations in LDCs are more R and D intensive than similar US firms investing in developed countries. The second contention (about transfer of technology) is

far more controversial. In one of the first systematic exposes of the subject Vaitos (1972) had taken an extremely pessimistic view – regarding patents as a means of blocking, rather than promoting, technology transfer. This is because, in his view "Patents give an exclusive monopoly position in a national market and not being exploited, they function so as to block the transfer of technology related to the patented products "and further" the closer a patent is to a final product the more it tends directly and indirectly to block transfer of non-patented technology, since that product can be imported from abroad in a secure monopoly-controlled market".

The restrictive business practices indulged by foreign patent holders in LDC markets have also been documented. The more important of these are (i) price fixing (i.e. prices charged by the licensee are fixed or controlled by the patentee), (ii) discriminatory rates (discriminatory royalty rates charged to different licensees), (iii) tie-in arrangements (lower royalty rates linked to purchases of other products from the licensor) and (iv) limitations on resale of patented products in domestic or world markets.

It is interesting to note that one of the avowed negotiating objectives of the LDCs in the Uruguay Round was to link the establishment of stronger IPR regimes with easier transfer of technology from the industrialised to the developing world. However, such a link is conspicuously absent in the Final GATT Text

ALTERNATIVE VIEWPOINT ON TECHNOLOGY TRANSFER

The theoretical case, highlighting benefits to the LDCs, from a stronger IPR regime, comes from Mansfield (1988), Primo Braga (1989) and Sherwood (1989, 1990). Mansfield (op cit) points out that "a reasonable amount of respect for IPRs" constitutes a critical mass for initiating technological development in LDCs, and Sherwood (1990) draws attention to the role of IPRs in fostering "an inventive habit of mind in the population", in encouraging industry-university interactions, and in the diffusion of corporate business practices. Other writers like Frischak (1989) emphasise the role of a sound IPR regime in inducing firms to make stronger commitments to R and D activities.

Empirical evidence to support this point of view seems to be slowly accumulating. In the Indian context, the beneficial perception of a strong IPR system, are most evident in the works of Desai (1985, 1988) and also of some others such as Pillar (1979), Katrak (1985), Subrahmanian (1993) and Deolalikar and Evenson (1990). Desai's (1988) conclusions, based on data for Indian firms in the mid-1980s, deserve reiteration

viz., that (a) multinationals are not the dominant technology suppliers to India and (b) technology imports have not resulted in monopoly creations. He is inclined to place the blame for India's poor technological showing nevertheless, on its government's active protection of industrial inefficiency. Subrahmanian's (1993) and Katrak's (1985) studies, though operating on different time-spans and data sets, come out with similar conclusions – indicating complementarity between domestic R and D and technology imports though the relationship is not pronouncedly strong. Deolalikar and Evenson (1990) succeed in establishing a positive correlation between US patent grants and inventive activity in India, and this may also be viewed as supportive of the complementarity hypothesis.

This viewpoint however suffers from two basic limitations. The theoretical underpinnings have not been sufficiently spelt out, and whatever relations have been made explicit are strongly grounded in the neoclassical paradigm, which seems to have severe limitations when applied to concerns involving dynamic considerations such as technical change [Nelson and Winter 1982 and Fransman 1985]. From the empirical standpoint, many of the causal relations identified would involve fairly long lags [e.g. the regression relation between R and D expenditure and technology imports studied by Subrahmanian 1993], necessitating data extending over long time-spans, which may rarely be available.

TECHNOLOGY TRANSFER PROCESS IN INDIA

The issue of technology transfer in India from a selection of industrialised countries was debated extensively in a Special Number of the *Economic and Political Weekly* (1985). While there were country-specific features, there was also a substantial common core of conclusions. We may state some of these common conclusions here since they may have a bearing on the issue of IPRs.

(i) Firstly, whereas the traditional view of technology transfer outlined above was one of a great deal of relevance to the Indian experience of the 1960s, the picture has changed considerably from the late 1970s onwards. From a long-term perspective, the technology import policy of India has been sufficiently flexible and has played a significant beneficial role in the development of the country's industrial technology capacity [Bell and Scott-Kemmis 1985].

(ii) Technology transfer to India seems to have occurred not at the suppliers' initiatives so much as at the initiative of Indian technology buyers.

(iii) Contrary to popular impression, Indian firms seem to prefer importing the most advanced and recent technology [Alam 1985].*

(iv) An important aim of the Indian technology policy has been to discourage import of packaged technology and turnkey plants. This aim seems to have been realised of late with a larger proportion (as compared to the 1960s) of the technology imported in unpackaged form.

(v) Indian technology policy has had, as one of its major objectives, the prevention of excessive payments for royalties and know-how. In most of the cases analysed by the participants in the *Economic and Political Weekly* debate (1985), royalty payments and (to a lesser extent) lump sum payments for know-how have remained within the norms prescribed by official technology policy (about 5 per cent of technology imports). This is considerably lower than royalty rates in other parts of the world [UNIDO 1977].

(vi) The simultaneous import of latest technology [(iii) above] and reasonable payments for technology imports [(v) above] was achieved by going in for smaller technology packages – i.e., while the technology transferred is of recent vintage, the range of products and processes encompassed by the collaborations are not only considerably less than that possessed by the supplier but also less than what he is willing to supply [Alam 1985].

(vii) Largely as a consequence of (vi), most of the R and D undertaken by firms is of the adaptive kind aimed at making the imported product or process more effective in the Indian environment. Another prime objective of R and D is indigenisation of production, for which the long-standing official Indian policy of import-substitution is mainly responsible. Other subsidiary objectives of R and D were quality control and customer services. Basic research aimed at innovation was conspicuous by its rarity. The quantum of R and D undertaken by itself is not very low – at 0.8 per cent (for the reference year 1989), it is higher than most middle-income developing countries and the newly industrialised economies of Asia (except Korea) [Evenson 1990], but its composition and thrust seem to indicate that 'frontier following' rather than 'catching-up' seems to have been the guiding principle.

(viii) A final point worth highlighting is the duration of collaboration. Since the mid-60s, the government has effectively prescribed an upper limit of five years for the duration of collaboration agreements. The motivations behind such a ceiling were to control the foreign exchange outflow and to accelerate the efforts of Indian firms to absorb the imported technology. The results however have been quite the reverse of those expected – Indian firms' access to technology has been severely curtailed (in the face of suppliers' reluctance to transfer technology involving a short stream of royalty payments as well as control on the

technology) and they have not had enough time to assimilate complex technologies.

As part of its liberalisation drive, the current government issued in August 1991, a new industrial policy statement, which modified several of the existing provisions. Most importantly, foreign technology agreements (and foreign equity participation up to 51 per cent) was made automatic for most industries (except those reserved for the small-scale sector, those relating to manufacture of electronic aerospace and defence equipment and those concerning the production and use of atomic energy). Further, the ceilings on lump sum payments was raised to Rs one crore, royalties for domestic sales and exports were fixed at 5 per cent and 8 per cent respectively, and the collaboration duration was extended to 10 years.

The interest of our paper is in examining how the changed IPR regime will affect the development prospects of low-income countries like India. The survey by Siebeck et al (1990) is quite exhaustive and analyses the administrative costs of a new IPR regime, opportunity costs of R and D, capital-formation, technological dynamism, anti-competitive effects and so on. However no very sharp conclusions emerge from the survey. We will therefore state here only two points not raised in the survey.

Firstly, the new IPR regime will certainly increase the technology suppliers' willingness to transfer new technology to LDCs because of a reduced fear of illegal imitation. It would generally be agreed that a part of the lump sum payment demanded by technology exporters is a kind of risk premium to cover such eventualities. With a strong IPR regime in place, the risk premium will go down and with more technology available for sale, not only will the choice set of Indian firms enlarge but royalties may also come down (owing to increased competition among technology suppliers). The possibility cannot be ruled out therefore that the new regime may not only make more technology available but also do so at a cheaper rate. Further the increased duration of collaboration, the relaxation on payment ceilings and the wide application of the automatic approval principle embodied in the New Industrial Policy 1991 are also likely to generate greater interest in the Indian technology market from foreign suppliers, which will reinforce the tendency mentioned in the previous paragraph, apart from making technology of more recent vintage available to Indian firms (a standard complaint among Indian firms has always been that the technology, even though very new at the time of application, becomes obsolete by the time it is approved).

The second issue we discuss is about the product and process patents. Developed countries have long been arguing in favour

of product patents especially in the food, chemicals and pharmaceutical sectors, where a product can usually be produced by a multiplicity of processes, patenting each of which would present several difficulties. The LDC's viewpoint is, on the contrary, that product patents discourage investment in R and D for processes of patented products, since these processes can only be protected through dependent patents conditional upon, the authorisation of the principal patent [Bifani 1990]. Another argument advanced by LDCs against product patents is that they stimulate imports, at the expense of domestic production, of patented products. Mansfield et al (1977) have noted the important point, substantiated with empirical evidence, that process patents are a more effective vehicle of technology transfer than product patents, and this argument has been further elaborated by Bifani (1989, 1990). Several other arguments are also invoked in the process vs product patents debate. Industrialised countries express the fear that process patenting alone is insufficient for IPR protection and can lead to widespread counterfeiting. LDCs on the other hand are anxious that product patents in the areas of food, chemicals (fertilisers, pesticides, etc) and pharmaceuticals might raise prices and curtail the supply of products of these industries, whereas their developmental needs dictate that such products reach as wide sections of the population as possible, at rates which are affordable.

The GATT Text Draft has given precedence to the advanced countries' point of view. The principle of product patenting has been granted universal recognition and simultaneously the patent period has been extended to 20 years (currently in India only process patents are being granted in the areas of food, chemicals, and pharmaceuticals with patents limited to a period of seven years from the time of filing or five years from the date of granting whichever is shorter). Two sectors in which IPR issues are particularly relevant for India are pharmaceuticals and biotechnology and the next two sections discuss the problems from the perspectives of these sectors.

V

Pharmaceutical Sector (in India)

GENERAL CONSIDERATIONS

While the prime impetus to strengthening global IPRs in the recently concluded Uruguay Round has come from the pharmaceutical sector in industrialised countries, patent protections in these countries is of relatively recent origin. (U K in 1949, France 1960, Germany 1968, Japan 1976, Switzerland 1977, Italy 1978, Sweden 1978 and so on.) In a significant part of the third world, patent protection for

pharmaceuticals is weak, with some countries (like India) providing only process patents and others (like Mexico and Zambia) no patents at all. Inherent weak protection is further supplemented by lax enforcements and an emphasis on compulsory licensing. This weak protection is alleged to have imposed substantial losses on pharmaceutical industries in the developed world – according to one estimate [Nogues 1990] the US loses annually \$ 1.4 billion from the sale of copied drugs in the four LDCs Argentina, Brazil, Mexico and India, with India accounting for about \$ 0.92 billion of such losses.

It is by now a well-documented fact that IPR protection is of far greater significance in the pharmaceutical sector than other sectors of the economy [Levin et al 1987, Mansfield 1986, Comanor 1986, Siebeck et al 1990, etc] – both because development of new products is very expensive and regulatory approval takes eight to 10 years (in the US), and also because imitation is considerably easy with very short imitation lags. One of the standard arguments used by advocates of strong IPR protection in the context of developed (and sometimes also developing) countries is that this will result in a fillip to R and D the argument is advanced with especial force for the pharmaceutical and chemicals sector. In this connection, it is interesting to observe that several recent studies have been posing a serious challenge to this contention. The 1990 report of the Special Committee on Ageing of the US Senate found that most new drugs introduced into the US market over the 1980s are very marginal improvements over the already available ones. Similarly a study conducted by USOTA in February 1993 maintains that most of the new drugs have offered "little therapeutic advantage over pre-existing competitors" [Vishwanathan 1993]. The USOTA study also showed how brand loyalty created by trade marks often perpetuated the monopoly rights of the patent holder well beyond the expiry of patent life. These considerations would naturally carry over to LDC imports of multinational pharmaceutical products.

INDIAN PHARMACEUTICAL INDUSTRY

Drugs and pharmaceuticals have always been regarded as 'essential products' in India and one of our former prime ministers was probably echoing this popular sentiment when she declared at a WHO meeting that "... medical discoveries will be free of patents and there will be no profiteering from life and death" [quoted by Gadhwani and Kenny 1988]. As such drug prices have been under heavy surveillance since 1962 when the Drug Price Control Order (DPCO) was passed. Under the DPCO, prices of about 153 bulk drugs and over 60,000 formulations were controlled. The Order has divided bulk drugs

into two categories: Category I (comprising 21 bulk drugs) is subject to very stringent controls and Category II (comprising 132 bulk drugs) is controlled to a lesser extent. There are several differences between the two categories, the main ones being (i) Small-Scale units are exempt from price controls in respect of drugs falling in Category II but not in Category I, (ii) Category I drugs are exempt from excise whereas Category II drugs are not and (iii) Formulations sold under generic names are exempted from price controls in Category II (if they are manufactured from a single bulk ingredient), whereas no such exemption applies for Category I.

In the last three years, the MNCs in India have been steadily losing out to Indian pharmaceutical companies – the sales of the former have been growing at an annual average of 16 per cent whereas those of the latter at 27 per cent and profit margins for MNCs are currently (1992-93) at 2.5 per cent, exactly half of those for their Indian counterparts. The reasons for this somewhat unexpected profile are three-fold: (i) The Indian Patent Law which by not recognising product patents so far, has encouraged Indian companies to invent around foreign product patents, (ii) the DPCO was revised in 1987, to exempt all new introductions in Category II from price controls, so that those companies which could introduce new drugs or formulations could chalk up impressive profits. Here the Indian firms were at a distinct advantage as compared to the MNCs, which were encumbered by the international code of respecting mutual product patents. (As an illustration, consider the case of Ciprofloxacin originally marketed by the MNC Bayer. In 1988, an Indian company launched a formulation based on Ciprofloxacin, which was a runaway success), and (iii) the pharmaceutical industry still continues to be regulated via licences (in spite of the general tendency in India to delicense industries, brought in the wake of liberalisation) and Indian firms know their way around the bureaucratic labyrinths better than their foreign competitors.

The main point of the above discussion was to highlight the fact that in the Indian context, the patent regime is only one of a complex of factors affecting the pharmaceutical sector, and the impact of a stronger IPR regime will be conditioned by other factors such as price controls, licensing policy, etc.

IMPACT OF NEW IPR REGIME

The issue of how a strengthened IPR regime will impinge on the Indian pharmaceutical sector has been the subject matter of an extended controversy [Mehrotra 1989, Keayla 1989, Prasad and Bhat 1993, Dhar and Rao 1993, etc]. The study by

Prasad and Bhat is probably the most detailed, invoking considerable painstaking and systematic empirical evidence, and in our judgment the most reliable. Its main conclusions may be listed as the following:

(i) One of the most important issues in this sector is the price-impact of the new IPR regime. Prasad and Bhat (1993) show that currently about 74 per cent of drugs and formulations are under the purview of the DPCO and thus subject to price controls. They attribute the relatively low price rises in drugs over the 70s and 80s compared to world levels to the strict DPCO controls. Hence, in their view, changes in the IPR regime will not have as much of an impact on prices as a decontrolling of this sector. There is, of course, the practical problem that a stiffer IPR regime might be progressively installed along with a gradual decontrolling of prices in this sector, and the former factor may be held responsible for the ensuing price rise, when the real culprit might be the latter.

(ii) An important factor determining the impact of patents on drug prices in India would naturally be the extent of the Indian pharmaceutical market covered by drugs patented abroad. These estimates vary from a low of 5 per cent (US Trade Representative Carla Hills quoted in *Business Standard*, April 26, 1992) to a high of 21.5 per cent [Indian Drug Manufacturers' Association 1992]. All the major patented drugs (such as Otrim, Inseptin, Asabut, Betacortril, Aristogyl, Insulins and Bricanyl) are also subjected to DPCO price controls. Further, in almost all the cases of the drugs mentioned, indigenous production accounts for the bulk of domestic production, thus showing as unfounded the fears that pharmaceutical patents are not worked domestically.

(iii) The R and D intensity of Indian pharmaceutical industry is fairly low, being a mere 2 per cent of its turnover whereas in industrialised countries the pharmaceutical sector would be spending about 10-12 per cent of its turnover on R and D. With the lead time of a new drug invention being 9-10 years and the cost between \$ 100-150 million, Indian firms find it much more rewarding to concentrate on adaptive research and quality control (what we have earlier called as 'frontier following' strategy). Indian companies attribute their low R and D to the poor incentives for innovation offered by the DPCO, and project the view that decontrolling is a necessary prerequisite for R and D. It is difficult to be optimistic about the positive impacts on R and D in Indian firms of a stricter IPR regime. We have seen earlier that even in industrialised countries, stronger product patents have only been tenuously linked to increased R and D. The link can be expected to be even weaker in India, with the DPCO intervening as an additional complicating factor. If the above

analysis is reasonably correct, then the government of India faces a stiff dilemma – it is already committed to the new strong IPR regime. If it persists with drug price control, then it will prevent the full benefits of the new IPR regime on R and D efforts in Indian firms, from being realised. If decontrolling is undertaken, then prices of essential drugs may go out of hand inviting unpleasant public reactions.

The Prasad and Bhat study can be faulted for ignoring the consequences of generic drugs which usually enter the market at high discounts *vis-a-vis* the brand names [Nogues 1990]. The price-cost differentials for generic drugs can be several degrees lower than brand differentials. Thus, in an IPR regime where only process patents are recognised, generics can cater to the lower market segments; however, with product patents introduced, generics cannot come into the market until after the expiry of the patent. Thus the introduction of product patents in India is certainly going to affect sections of the poor who will now not have the generic option open. The consequences will be particularly serious since a National Health System is not in effective operation in India. The acceptance of the new IPR regime must be accompanied by a more effective National Health Scheme if the social discontent among the poor is to be contained.

VI

Agriculture and IPR Issues in India

The issues of IPR protection in the field of agriculture are of relatively recent origin. The two main forms of IPR recognition in this area are patents and plant breeders' rights (PBRs). (PBRs are granted for plant varieties which exhibit the following characteristics: (i) stability (over repeated propagations), (ii) homogeneity (uniformity of salient characteristics over a single planting), and (iii) distinguishability, i.e., the variety for which PBRs are sought should be distinguished from existing varieties (though not necessarily in an economic sense) [see Murphy 1979 and Lesser 1987]. PBRs are subject to two exemptions – farmers' exemption and the research exemption. The first confers on the users the right to retain part of the harvest for subsequent planting as seed. The second exemption permits breeders to use a protected variety in subsequent breeding experiments, the outcome of which qualifies for protection under certain conditions. Thus PBRs constitute a weaker form of protection than patents [Siebeck et al 1990].

A landmark in the evolution of plant protection was the adoption of the International Convention for the Protection of New Varieties of Plants (UPOV) in 1960, which has currently about 17 signatories mainly from the OECD countries (no LDC

is a subscriber to the Convention). UPOV covers plant varieties only and confers PBRs as described above. In the wake of UPOV, several OECD countries introduced or modernised legislation relating to PBRs. The US legislated the Plant Variety Protection Act in 1970; in 1980 the US Supreme Court in the famous *Diamond vs Chakrabarty* case, for the first time extended patent protection to living organisms. Plants and seeds patenting was recognised in the US as late as 1985. Whereas the US provides a very broad scope of patent protection for living organisms, this scope is considerably narrower in other industrialised countries, and virtually non-existent in the LDCs (where most plant breeding work is under the aegis of public research institutions).

PBRs AND INNOVATIVE ACTIVITY

As we saw above, seed patenting is a very recent phenomenon and so it is too early to predict what impact patents have on innovative activity. PBRs, on the other hand, have been in existence for a long time (especially in the US) and hence substantial evidence of their impact on research in agriculture technology has accumulated. The consensus emerging from several studies for the US [Brim 1987, Butler and Marion 1983, Mooney 1979, Sasson 1988, Lesser 1986, etc] indicates that PBRs stimulate private sector research, as measured both, by the number of breeders as well as by the number of new varieties introduced. Murphy's (1979) study draws similar conclusions for the UK (where PBRs were introduced in 1964).

The potential impact of PBRs and seed patenting on private sector innovative activity in LDCs is very difficult to assess, because very few LDCs, at the moment, provide any form of plant variety protection. Pray (1987) documents evidence from Chile and Argentina (two countries which have adopted some forms of PBRs but which are not signatories to UPOV), to show a favourable impact of PBRs on private sector breeding activities as well as on the facilitating of joint ventures between private sector and government research institutes.

In India, an additional complication arises from the fact that until very recently [McMullen 1987] private sector breeding activity has been discouraged officially for fear of displacing the public sector's commanding presence in the commercial seed market. As a result, private sector investment in seeds in the early 1990s was not more than US \$ 1 million.

Several writers have emphasised that IPRs in agriculture do not represent an unmixed blessing [Brown 1988, Juma and Ojwang 1989, Kenney 1986, Lacy and Busch 1989, etc]. The various criticisms have been grouped by Siebeck et al (1990) under the following broad headings.

(a) *Narrowing of the genetic base:* The narrowing of the genetic base increase vulnerability of the crop to single-gene-based pathogens so that genetic uniformity increases the dangers of famines. PBRs aggravate this risk in two ways—firstly the 'homogeneity' provision (discussed above) encourages uniformity, and secondly as the protected varieties have higher yields, producers are tempted to switch from their more genetically varied crops to these protected varieties.

(b) *Freezing of the exchange of germplasm:* Breeding activity depends on the availability of novel germplasm and the economic value imparted to germplasm by PBRs may act as a dampener on the free exchange of protected material and thus jeopardise further research. There is already evidence in the US that PBRs have slowed down the flow of information from private breeders to universities.

(c) *Germplasm conservation:* Germplasm conservation has raised an important issue in the North-South context. Gene banks that preserve germplasm are located in the developed world but most of the wild and locally cultivated varieties that make up the collections originate in the LDCs. The 20th and 21st sessions of FAO witnessed Spanish and Mexican initiative to resolve this problem. After a series of deliberations, in March 1987 an International Gene Fund was created (in the teeth of general opposition from the US) with the proviso that the Fund could be financed from a levy on commercial seed transactions. The FAO in 1987 also passed a resolution recognising germplasm as a common heritage of humanity and adopted a bill of 'farmers' rights'.

BIOTECHNOLOGY COSTS AND CONSEQUENCES

Biotechnology is a generic term used to describe any manipulation of living organisms aimed at altering their characteristics. In this sense it includes not only traditional plant and animal breeding but also fermentation processes in the making of yogurt or beer. In modern parlance, however, the term is restricted to apply to a cluster of highly sophisticated biogenetic techniques developed within the last two decades as a result of major advances in molecular and cell biology. The applications of such techniques could be grouped under four headings [Buttel et al 1985]: (i) plant genetic manipulation and breeding, (ii) industrial tissue culture, (iii) applications in dairying and animal husbandry, and (iv) the use of genetically manipulated micro-organisms to produce new and displace old agricultural products.

Biotechnology has immense potentials for raising productivity of agriculture in both industrialised countries as well as the third

world. Specific improvements relate to (i) yield growth, (ii) nitrogen fixation (in non-leguminous crops), (iii) enhancement of photosynthetic activity, (iv) better tolerance to soil conditions (such as cold, moisture, salinity, etc), (v) pest and pathogen resistance, and (vi) plant architecture [Brady 1982, Plucknett et al 1987 and Swaminathan 1982]. Such improvements could impinge importantly on the agro-systems of the LDCs. Achievement of nitrogen fixation in crops like rice or maize would greatly reduce expenditure on fertilisers, similarly techniques that strengthen pest-resistance could economise on other chemical inputs. Development of crop varieties with reduced water usage could obviate or alleviate the necessity of incurring huge irrigation expenditures (an issue of vital concern for India). Similarly Farnum et al (1983) point to the possibility of genetically engineered forest species putting a check on the deforestation and erosion problems characterising several parts of the third world. In spite of the impressive potential of biotechnology, actual progress to date has been rather sluggish – the most significant developments have largely been confined to dairying and animal husbandry, where growth-inducers (e.g. Somatotropin) and animal vaccines (e.g. hoof and mouth vaccine) have made commercial headway.

Even though the long-run impacts of biotechnology are likely to be favourable, in the short run LDCs are likely to have to make several adjustments. Several authors [Sasson 1988, Da Silva et al 1992, etc] have indicated the possibly adverse impacts of biotechnology on the agriculture and food-processing sectors of LDCs. A primary example is that of High Fructose Corn Syrup (a sugar-substitute obtained by enzymatic transformation of corn starch) whose production in the US has tremendously increased after 1975 to replace much of its sugar imports, spelling disaster for the indigenous sugarcane producers of Brazil, the Philippines and the Caribbean [Hobbelink 1991]. Another food-item likely to be affected by biotechnology is cocoa-butter where production by tissue culture of a synthetic substitute is well under way. Chilli and saffron are yet other food items facing possible competition from plant cell cultures. The latter can also be used to produce on a commercial scale flavours such as orange and grapefruit and fragrances such as jasmine [Sasson 1988]. Of course, the possibilities of import-substitution are not only one way. The LDCs can also utilise genetically modified substitutes for costly imports from the north – the most pertinent example being that of bioethanol production in Brazil as a substitute for petroleum [Omvedt 1993].

The dangers posed by biotechnology for LDCs have also been spelt out in Da Silva et al (1992). "Such is the cost of these

techniques and such is the prohibitively expensive cost of developing new products... that if we wanted to create a hole down which precious money and resources could be poured, then this is that hole. Biotechnology, if not wisely applied, can be a black hole, down which valuable resources of money and intellectual manpower of a developing country can disappear without any positive benefit accruing to the investing country." An extreme view, following from the above sort of considerations, would be one such as that of Omvedt (1993) "... if patents will make expensive and unsustainable biotechnologies less accessible all the better! Easily accessible enslaving technologies are more dangerous". In addition to such viewpoints we have also the more stereotyped dependency theories as applied to biotechnology [see the article by Ratledge in Da Silva et al 1992]. On balance, however, the pragmatic alternative seems to be not to insulate oneself totally from the emerging developments in this powerful sector of technology but at the same time not to rush into uncritical acceptance of all its aspects ("we may flutter our eyelids but need not disrobe" as one famous Indian agronomist put it in a private conversation).

BIOTECHNOLOGY AND IPRs

The most distinct feature of the ongoing Biorevolution is its essentially private character. The reasons for the private sector playing a leading role have been extensively analysed by Buttel et al (1985) and we need not go into them here. But from the LDC perspective this has the critical implication that unlike in the Green Revolution (where the leading players in the developed world were public-sector research institutions) when the technology was transferred on a government-to-government basis at very low cost, the technology transfer in the Biorevolution is likely to entail substantial costs with joint ventures the favoured medium. The issue of IPRs is thus likely to loom large, as a precondition for the effective transfer of technology. Since India has accepted the Final Text of the Uruguay Round and the IPR regime implied therein, the necessary conditions for the transfer of biotechnology from the advanced countries have been met. But still, because of the specialised nature of the IPRs in this area, enforcement problems will be manifold: (i) Firstly it could be difficult to identify a patented plant or seed because both are subject to natural genetic drift and mutation, (ii) Secondly, agricultural inventions can give rise to derivative or dependent inventions with the result that multiple royalties could occur on a single product, and (iii) Thirdly, very often infringement can only be proved by comparing entire genetic makeups. All these mean that mechanisms to prove infringement can prove to be quite

costly for LDCs. The GATT Text does lay down on the signatories the obligation to have adequate enforcement procedures, though the actual contents of such procedures are yet to emerge – at the moment they have been left to national initiative but if past history is any guide pressures from the developed world will start emerging in the near future to have globally agreed minimal standards of enforcement.

VII

The 'Opt-Out' Option

One of the most polemical critics of the GATT in India, Nanjundaswamy said in a recent interview "I have been saying that just like what Russia did for a few decades, developing inside an iron curtain, and the way China developed itself behind a bamboo curtain, I would like India to encircle itself with a khadi curtain" (*Mainstream*, May 8, 1993). A more sophisticated statement of the same argument is made by Shukla "The fear of isolation is conveniently used by those who are willing to make significant concessions to the other side but are afraid of the political-fall-out at home. Avoiding isolation is then raised to the status of an objective desirable *per se* and to be pursued at any cost. The protagonists of avoiding isolation at any cost rationalise their belief in terms of the absolute superiority of multilateralism to other modes of international relations in trade and economic matters. But neither the history nor the practice of multilateralism in GATT supports this belief" (*Mainstream*, July 24, 1993). Thus substantial sections of the (usually left-wing) intelligentsia and political parties see isolationism as an effective opt-out strategy available for India.

Of course, the consequences of refraining from acceding to the new GATT Treaty are difficult to estimate, because the precise nature of the inevitable trade retaliation that will follow in the wake of such a step have not been clearly spelt out. The US, in all probability, will invoke the special 301 provision of the US 1988 Trade Act against countries refusing to obey the GATT code on IPRs. The minimal level of retaliation could be the suspension of GSP privileges to imports from such countries into the US. European countries are also likely to execute similar threats. In the 1990s, about 14 per cent of India's exports to the US were accorded GSP status. It is doubtful if India could retain the markets for such exports if their GSP status was revoked. This issue however deserves a careful examination – if the GSP status of the imports from a number of LDCs were revoked simultaneously, the damage to individual countries would be much less. Thus the potential trade loss on a specific country imposed by such retaliation would certainly depend on whether the

country was alone in its choice of the "opt-out" strategy or whether it was part of a group of countries adopting a similar strategy.

But trade retaliation could go much further – depending on how much out of alignment national IPR systems were with the GATT TRIPS proposals. Total trade embargo for at least limited periods is a distinct possibility. Advocates of isolationism would probably welcome such an embargo, but those who invoke the 'iron' and 'bamboo' curtains tend to forget the elementary lesson that even the severest autocratic regimes find it difficult to insulate the domestic consumer from the attractions of foreign goods; and further, that several items for mass domestic consumption rely for their manufacture on imported machinery. Some isolationists even point to the national gains that can be made from illegal imitation, copying and counterfeiting, conveniently forgetting that even such activities need a minimum threshold level of technological expertise, which will be denied in the absence of a modicum of IPR protection.

But there is another strand to the isolationist argument – the possibility of the LDCs forming regional trade associations and focusing on South-South trade. This possibility deserves to be examined at some length, since its advocates seem to place tremendous faith in its validity. One of the most important principles traditionally applied for predicting trade flows is the Heckscher-Ohlin principle about countries exporting commodities that use their relatively abundant factor intensively. Empirical evidence seems to be in consonance with the predictions of this theory for north-south trade [Leamer 1984, Tharakan 1984, etc], and also for certain categories of south-south trade [Havrylyshyn 1985]. The countries of the south constitute a heterogeneous group forming a ladder of relative factor endowments – trade between LDCs at opposite ends of the ladder seems to fit well the Heckscher-Ohlin pattern.

However the H-O theory cannot be invoked to explain the growing proportion of trade in similar commodities between countries at similar levels of development – such trade is better explained by Linder's (1961) hypothesis of intra-industry trade. According to Linder's theory the narrowing of income differences between any pair of countries would expand rather than diminish trade, because a growing portion of the demand in each country would overlap, thereby increasing bilateral trade in specific varieties of similar goods. Empirical evidence seems to indicate that the importance of intra-industry trade will increase with rising incomes and the spread of manufacturing. Currently South-South trade accounts for about 7.8 per cent of total world trade

(calculated from IMF DOTS for 1991) but this trade will certainly increase as incomes in the south rise. Thus whereas in the long run south-south trade could offer some prospects, in the short run the south will be heavily trade-dependent upon north.

This shows that the opt-out strategy so fervently advocated by LDC critics of the GATT agreement is not a feasible strategy at the current stage of development of most LDCs. Our discussion has focused only on the trade-related aspects of this strategy but if one takes into account the fall-out on foreign investment, aid and the costs of working out bilateral agreements (in each specific case), the costs of an opt-out strategy would be enormous – a leap into economic disaster.

VIII Conclusions

Our paper has ranged over a wide spectrum of issues relating to IPRs in the context of LDCs (with special reference to India). We began by reviewing the political economy of the factors leading up to the polarisation of views at the Uruguay Round and found that the confrontation between the industrialised world and the LDCs was the outcome of fundamental shifts in the nature of technology which had occurred in the past two decades. The Uruguay Round, propelled strongly under US pressure, veered round to what Subramanian (1991) has referred to as an HN (High level of non-discriminatory IPR protection) regime.

The economic impacts will depend not only on the IPR regime itself, but also on several associated factors such as the official Indian policy on foreign collaborations and foreign direct investment, as also on fiscal concessions for R and D in firms, etc. But perhaps the critical factor is whether, now that the industrialised countries have succeeded in having an IPR regime of their choice installed in GATT, they will make the transfer of technology to LDCs more flexible and easy. It is also important to note that the impact of the new IPR regime will vary from sector to sector. Two of the most important sectors likely to be affected vitally are the pharmaceutical and agricultural sectors and both of these sectors (in the Indian context) have been analysed at some length in this paper. We have also given a serious examination to the populist view, advocated by several academics and politicians in India, to renege on the GATT Agreement. Our conclusion is that this would be tantamount to an economic harakiri for the nation. The GATT is a Hobson's choice for India and most other LDCs.

The acceptance of the GATT proposals in the Uruguay Round with its endorsement

of the US viewpoint is probably a reflection of two phenomena – the emergence of the US as a political as well as economic hegemon and the breakdown of LDC solidarity. In the era of international Darwinism ushered in by the GATT, the 'sauve qui peut' philosophy is going to pervade the thinking on trade policy among the newly industrialising LDCs. There is the very real danger that the 'scramble for markets' set in by this process will aggravate regional conflicts in the third world. Thus there is considerable ground for apprehension on both the economic and political fronts in the wake of the conclusion of the long drawn-out Uruguay Round.

[I am very grateful to Mancur Olson for inviting me to write this paper and to Satu Kahkonen and Brian Fikkert for helpful suggestions. Errors and shortcomings are entirely the author's responsibility.]

Master-Servant Relationship in a Cross-Cultural Perspective

Lakshmi Srinivas

A review of recent literature shows racial and ethnic dominance to be an important factor in constructing the master- or mistress-servant relationship, and in countries which have been colonised, ideas of the ruler and ruled are carried over into the domestic sphere. More generally, these studies have drawn attention to the complexities of servitude where relationships are structured around difference and where difference translates into cultural superiority and ideological dominance.

THE master-servant relationship with origins in slavery and serfdom has been thought of as a 'natural' relationship, as fundamentally important as that between husband and wife or parent and child.¹ It has been argued that domestic servants are key figures in social reproduction and in ideological maintenance as they are involved in the physical maintenance of the household, play a major role in socialisation into the dominant order, and in perpetuating basic patterns of oppression and stratification [Cock 1980; Smith 1973; Taussig and Rubbo 1983]. Servants become the "essential link between the macro-structure of political life and the micro-structure of domestic and personal experience which prepares and sustains people for their roles in society" [Taussig and Rubbo 1983: 5-6]. Though often presented as a third world problem [Chaplin 1978; Smith 1973], in all important aspects such as low wages, long hours, low prestige, and as the occupation resorted to by the least skilled, least assimilated group, domestic service is seen to reflect worldwide patterns [Rollins 1985:44].

Chaplin, who has studied the occupation in the context of industrialisation, is of the opinion that a comparative and historical study of domestic servants is important from the point of view of contributing to an understanding of women's employment, industrialisation and urbanisation, and child-rearing among the middle and upper classes as well as relationships of dominance involving ethnic or racial components [Chaplin 1978:97]. However, there have been relatively few attempts to study the issue of servitude in contemporary societies. The institution is frequently identified with slavery and pre-industrial societies, as such not part of modernity, and presented as an occupation that is becoming extinct. The few studies which have been carried out have addressed the following questions: is domestic service 'pre-industrial'; has it declined with economic development and industrialisation and is it likely to disappear (once the process of 'development' is complete)? Is domestic service transitional, dependent on fluctuations in the economy [Chaplin 1978] or more permanent, having

to do with the construction of identities, with status and dominance needs [Hansen 1989; Rollins 1985]? It has often been presented as a third world phenomenon. Is this because of a confusion with the larger issue of social inequality? Is it therefore an indication of social inequality rather than the level of industrialisation? Is it a 'bridging occupation' [Smith 1973], providing a means of acculturation and socialisation for the rural migrant, or is it a dead end [Jelin 1977]?

These questions emerged as significant ones in the context of historical research carried out on industrialising England and France [Chaplin 1978; Coser 1974; Davidoff 1974; and McBride 1974], societies which were not as diverse, ethnically and racially, as societies today, and where the main difference between servants and employers was based on class which arose primarily from landownership, rural origins and income. More recent work on South Africa [Cock 1980], Zambia [Hansen 1989], the US [Glenn 1981; Rollins 1985], and Latin America [Bunster and Chaney 1985; Chaney and Castro 1989; Young 1987] has revealed the space-time limitations of the findings. A review of recent literature shows racial and ethnic dominance to be an important factor in constructing the master- or mistress-servant relationship, and in countries which have been colonised, ideas of the ruler and the ruled are carried over into the domestic sphere. More generally, these studies have drawn attention to the complexities of servitude where relationships are structured around difference and where difference translates into cultural superiority and ideological dominance [Cock 1980; Hansen 1989].

REPRESENTATIONS OF THE SERVANT

The servant is a powerful symbol in society. Hansen, writing on Zambia, states — "...the figure of the servant as a metaphor has been used to highlight intimate psycho-sexual power relationships, to represent the African oppressed, as a symptom of nationalist awakening, or as a yardstick against which the health or sickness of post-colonial African society is measured" (1989:22). Servants appear to be central to the functioning of the

household and to the structuring of society but at the same time servants are regarded as marginal individuals, even 'non-persons' not only in the households where they work but also in the larger society where they are restricted to the informal sector and often to non-wage work [Young 1987:366-70].

The entrenched nature of domestic service in everyday life is seen in the many references to it in the media, film and literature where servants are often key figures in the plot. The phrase 'the butler did it', from a British detective novel is reproduced in the context of a joke. Such phrases have provided clues to the ways in which servants are perceived. The butler being a marginal person in the household was the most unlikely of all to have done the deed. As a non-person he did not count and therefore, provided a surprise twist to the construction of the plot. Servants have also been used to convey ideas about societal norms and values as well as aspects of social change. The representation of the servant is summed up as, "The literary writer's servant is there in an active variety: as a loyal tool, mercenary opportunist, active agent, disturber of the social order, representative of the rising bourgeoisie, forerunner of the revolution" [Hansen 1989:22].

Representation however is not merely reflection, it is itself an active force in moulding social relations and social understanding. Comelia Butler Flora (1989)² has analysed the fotonovela and the Latin American soap opera which she argues play an important role in monitoring the images that enter the popular consciousness by projecting images to the servant class which are different from those projected to the employer class. Entire themes are often built around the social group of servants. Upward mobility is a popular theme in the series aimed at servants. The maid wins over the millionaire with her good nature and selfless devotion, in the process discrediting his upperclass fiancée. QED, social class is not important to love and happiness. The fotonovela, while offering a fantasy escape for servants,³ at the same time reinforces their image as background status objects. Maids are used to create an atmosphere of

wealth and gracious living as well as to send messages which reinforce gender and class stereotypes.

The presence of the maid... opening a door or serving a drink provided an ambience of affluence and comfort through passive service that men of substance – doctors, lawyers, businessmen – needed in order to pursue their more important ends in life [Flora 1989:148]

The servant's role therefore serves as an important vehicle for the propagation of cultural stereotypes which have built into them, racial, gender, regional, religious and class ideologies. Hansen (1989:37) notes that British novels set around 1908-09 depicted Africa and Africans as "backdrops against which fairly rich whites went to play". Stories of the Raj are filled with references to incompetent, bumbling servants with strange, incomprehensible customs. Margaret MacMillan (1986) writes that the British favoured Muslims over Hindus for servants. Muslims were supposed to be more loyal and straightforward, "a quality often attributed to the fact that they worshipped only one god and were "people of the book" just like Christians" (1986:145). However, Christians who were Indians were disliked. They were considered dishonest. This may have been because in the construction of difference, which Hansen argues is central to the master-servant relationship, Christians were difficult to place as they were perceived as uncomfortably close at the same time culturally alien to their employers. In the US, the parallel stereotype is the Black housekeeper of the 'Gone With the Wind' type southern novel who was 'part of the family', offering lifelong devotion. This stereotype was recently resurrected in the film *Driving Miss Daisy* which seemed to evoke some of the nostalgia for the 'old days'. In contrast, romance and adventure novels set in 19th century France and England often portray the governess or paid companion who made a fortunate marriage.⁴ This is not to say that other themes were not popular as well, but studies suggest that mobility through marriage was more common in 19th century England and France than elsewhere [McBride 1974]

Given the recognised importance of servants and their substantial presence in the labour pool,⁵ it is curious that till recently, except for some stray references, the issue of domestic service has been neglected. Hansen in addressing this question attributes the lack of attention given by historians and anthropologists to the limitations of explanatory frames that ignore the individual as a human agent: "The previous generation's scholarly community reacted like most employers of servants: they took them for granted" (1989:9). Another reason for the relatively few studies on servants is attributed to the difficulty of getting information:

domestic workers are recruited informally,⁶ are unmonitored by the state and confined to the home. In the US immigrant Irish women have been replaced as domestic servants by black women and increasingly by 'illegal' immigrants from Latin America, Mexico, the Caribbean and Asia [Rollins 1985]. Another reason for the invisibility of domestic service is due to its being considered a low status activity which demeans those who are forced to engage in it [Cock 1980:71; Cover 1974:39; Katzman 1978:378; MacMillan 1986; Mohammed 1989:161; Rollins 1985:58]. Women who have been domestics do not want to admit to working a low-status job [Smith 1973]. This again contributes to the information problem [See also Radcliffe 1990:390].

Related to all these reasons is the fact that domestic work is considered the woman's domain⁷ where unfortunately little has changed. *The New Statesman* ('A Clean Conscience', March 10, 1989) commenting on the failure of feminism to bring about alternate life-styles with shorter working hours and shared work in the home, notes that part of the failure is that "women continue to be held responsible for household maintenance, their own lives, their children's and that of their companions". The labour of working class women continues to enrich and free the lives of women above them.⁸ The public-private split, with the public sphere considered a more legitimate domain for attention, has contributed to making domestic service unworthy of notice. It has become invisible as other 'women's problems' have.⁹ Questions about housework remain taboo.

The mid-19th century was a crucial period (in the history of the west) in the development of the notion of 'the separation of spheres' and the confinement of women, ideologically if not for all women in practice, to the 'private' sphere of the suburbs and the home [Davidoff and Hall 1983; Hall 1981]. In keeping with this, authors of the 19th century etiquette advised their readers to avoid the subject of servants in conversation as not only being boring, but too blatant an effort to advertise the face of command [Dudden 1983:115]. MacMillan sympathises with the lot of the English housewife in an alien land rather than with the servant under alien rule: "It is scarcely surprising that some women became bores about housekeeping, boasting of their triumphs over box-wallahs, servants, white ants..." (1986:88), and reports that one of the several popular guides for 'mumsahibs' cautioned, "do make it a strict rule not to talk of servants and housekeeping when you go out... one sees groups of women at the club comparing notes about... what their cook's daily bills amount to". Attempts at bringing it into the public debate continue to be attacked. One woman interviewed by *The New Statesman* objected to enquiries about housework, who did it and what

feminism had to say about it on the grounds that questioning feminism's stance on housework is itself anti-feminist. While it is clear that the issue of housework and employing domestic servants to do it cannot remain the responsibility of women if feminism is to gain ground, and feminists are unwilling to talk about domestic service in the context of women's work, an unwillingness to discuss the matter has resulted in the *de facto* support of the more conservative ideology which maintains that domestic service is a 'women's problem', and one not to be made public.

LOW STATUS

The domestic worker automatically has low status in a society whose definitions of class rely on occupational classification [Mohammed 1989:161]. The work is assigned a low rank because it is associated with women, does not call for any particular identifiable skills, is considered drudgery¹¹ involves cleaning which is influenced by ideas of purity and pollution and is associated with preindustrial rather than the 'modern' sector since it takes place in the household and can be carried out with little aid from machinery [Cock 1980:66]. The association of domestic service with prostitution and with destitute women and children has withstood time and industrialisation, and appears to have no geographical or cultural boundaries. While a large percentage of destitute women and prostitutes were domestic servants in London in the 1840s [Tellis-Nayak 1983:71] a survey of Peruvian women in the 1970s continued to place the work only a little above prostitution and begging in the occupational hierarchy [Heyman 1974]. Shelley Cohen (1989) and Rollins (1985) both emphasise the stigma attached to servitude deriving from the work as well as from association with the social groups which dominate the occupation. Performing this work reinforces low status among groups who are accorded low status in an ideological context that turns difference from those in power into inferiority. For example, in Boston in 1950, when 70 per cent of domestic workers were Irish, anti-servitude sentiments were translated into anti-Irish sentiments¹² in what is seen as a close approximation to a caste-like social group.

Rollins notes that when blacks and immigrant women are employed as domestic servants, class prejudices, ethnic prejudices and the degradation of menial labour interplay to strengthen anti-servitude sentiments.

Grounded in stratification, domestic service was always composed of people considered inferior (by virtue of their unfree status, their gender, their geographic origins, their lower-class background and/or their caste, race and ethnicity) and always held in the lowest esteem [Rollins 1985:58].

In the Indian context, caste makes for a more intricate system of division of labour among domestic servants and the status assigned to different types of tasks. Notions of purity and pollution influence what tasks can be assigned to whom. High caste servants often refused to perform tasks which they considered defiling, much to the annoyance of their British mistresses.¹³ The British were forced to learn from the confusing array of castes and religions whom they could hire for what job. The lowest status work had to do with cleaning (sweeping, laundering clothes, taking out the garbage), the dirt created by another.¹⁴ Brahmins preferred to work as gardeners as it enabled them to avoid contact with polluting (beef- and pork-eating) foreigners. Poorer brahmins who might have worked as cooks in the households of the higher Hindu castes, did not opt for cooking in European homes because much of the food that was cooked was polluting to them. Sweepers hailed mostly from the lower castes but "even sweepers had their limits, they would not touch dead animals. For that a still lower grade of untouchables had to be employed" [Macmillan 1986].

It may be noted in this context that the practice of keeping servants was not confined to the British (or other foreigners only). Upper class and upper caste Indians did keep – and continue to keep – servants. Affluent landowners in rural areas, and rich and middle-class families in urban areas, regularly employed – and employ – servants. In rural areas domestic service was frequently an aspect of debt-bondage to the master. Srinivas (1987:87-88) reports on 'jita' servitude prevailing in south Karnataka in which the debtor pledged his young son or nephew to work in the master's household till the debt was repaid or worked off. Debt-bondage was also characteristic of other parts of India. In the Tehri-Garhwal region of Uttar Pradesh a poor man who got married, occasionally pledged his wife to work in his master's household, and also serve as his mistress till the debt was cleared [Galey 1983:93]. In such cases the servant could hail from the master's caste or a low one, including untouchables. This was also true of south Karnataka [Srinivas 1987:88].

Domestic service in the house of a lower caste person may lower the status of the high caste servant but that need not always happen depending on the kind of service performed. Thus brahmins may work as cooks in the homes of rich kshatriyas and vaishyas in north India without experiencing loss of caste. Cooking is often a traditional occupation of brahmins, and also, the conditions of work are such that the purity of the brahmin is protected. (in fact, in the caste context, it is in the interests of the employer to protect the purity of the cook.)

It must be pointed out that in India today domestic service is status-enhancing for some

lower castes in comparison to the alternative occupations open to them. For instance, a recent study of women domestic servants in Delhi reveals that the employees regarded their work as status-enhancing, and listed as reasons, clean working conditions, convenient working hours, and association with their middle or upper class mistresses. It is interesting to note that although caste is on the decline in urban centres such as Delhi, the domestic servants who were interviewed belonged to the lower castes while their employers hailed from middle or high castes [Dasgupta 1984].

Even in the US, domestic service need not always be regarded as of low status: In her study of Japanese-American women, Glenn (1981) reports that the women she interviewed did not consider domestic work particularly degrading and some even preferred it to other work. The reasons given by her respondents were that it was flexible, that it permitted greater autonomy as it did not involve being closely monitored like factory-work and was therefore more 'dignified'. Another advantage was that it could be hidden form of labour, often husbands did not know their wives were working as domestics and it was therefore a source of income for the woman which was completely under her control. Many women cherished the opportunity to work at all, when they did not know English, and many had built what they considered to have good relationships with their employers.

The clue to understanding the above situation is provided by Davidoff when she emphasises that "the context and meaning of domestic work are culturally defined and culturally variable" (1974:70). The combination of a strong work ethic and the cultural acceptability of housework and part-time work for women in Japanese society may have drawn these women to domestic service and given them the cultural legitimation to remain in it [Glenn 1981: 365-67]. According to Kondo (1990), in Japanese society the household is a productive unit and housework is often not separable in traditional conceptualisation from 'outside' work because of the tradition of household enterprise. For Japanese women, work outside the home becomes an index of commitment to the 'uchi' or household unit. Given that the 'professional housewife' is a desirable model [Kondo 1990:281], the image of domestic worker may not carry the stigma it does in some other cultures. Both Kondo and Glenn mention the following characteristics of the work in which Japanese women were likely to be found: it could be carried out part-time (full-time work is a masculine domain) [Kondo 1990:280], or in the home and involved traditional women's tasks such as sewing, cleaning, washing clothes or preparing food [Glenn 1981:358]. Therefore,

even when white-collar jobs were available in the US, Japanese women were opting for domestic jobs.¹⁵ Glenn attributes this to the extremely exploitative nature of white-collar work. Even so, the fact that in Japanese culture it is considered necessary for girls to be well-versed in household tasks,¹⁶ may have played a role in influencing these women to do housework. Another powerful factor in pushing women into domestic service is the work ethic, which stems from the Meiji-era, which says the worst situation is being idle and many of Glenn's interviewees voiced this feeling. Most post-retirement domestics in Glenn's study denied overwhelming financial need. They said they liked to work and if they stayed at home "it is not good for me". They associated being idle with depression and thoughts of 'the bad old days' [Glenn 1981:374-75]. Work proved to be a way to forget the problems of the past.

PROFILE

Who is the 'typical' domestic worker, what are the features which characterise the group? In the US in 1970 there were more than one million private household workers of whom nearly 97 per cent were women. More than half of all private household workers were black women, and they tended to be older women [Katzman 1978:379]. Cock (1980:99) reports of South Africa that domestic service is largely a black, female institution. *The Economist* (The Servant Problem, March 17, 1990) has the most current description of the population group which the typical domestic servant is drawn from young women with little or no education or skills and low expectations, mostly migrants. Dominant images have consistently depicted servants as women without independent lives or interests. Palmer and Young report that domestics were envisioned as single women, young or old, cut off from any attachments except those to the employer's family [Palmer 1989:87; Young 1987:370]. Cock (1980:51-52) also comments on the pattern of 'family disorganisation' among domestic workers. They are more often women whose family life has been disrupted by poverty and migration. In her sample 78 per cent had been married but only 48 per cent were still married while others were widowed, divorced or deserted. This description appears to fit over space and time: In Lima, between 1956-66 nearly two-thirds of the economically active female migrants worked as domestics while in 1981 the numbers had increased and women made up 85 per cent of the 1,80,624 registered houseworkers [Radcliffe 1990].

Smith (1973:193) whose work is also based on Peru, remarks that "domestic workers are not typically represented by a narrowly defined segment of the urban lower class... the women range from 15 to 24 years, ...are almost exclusively unmarried".

Rollins (1985:55) corroborates: "the typical female domestic is a migrant from a poor non-urban area who engages in domestic service until marriage or a more desirable employment opportunity presents itself".

Recent trends as revealed by the Indian census point to the rapid feminisation of domestic service. The 1971 Census enumerated 6,75,878 domestic servants of whom only 2,51,479 were women while the 1981 Census reported the number as 8,07,470 of whom 5,05,023 were women. In 1981 women formed more than 50 per cent of domestic servants as compared to 37.2 per cent in 1971. Further, the number of male domestic servants declined over the 1971-81 Census from 4,24,399 to 4,02,387. But feminisation of domestic service has occurred mainly in urban areas. Incidentally, the growth of domestic labour force is associated with rapid urbanisation occurring in the country. Thus while in 1971 about 63 per cent of domestic labour was urban, in 1981 the proportion was more than 68 per cent.¹⁷ But the continued presence of a significant number of men in domestic service calls for an explanation. It provides immigrants from distant rural areas valuable and protected entry into urban life, a base from which they can explore the mysterious urban world, and the opportunities it affords them. Its anonymity enables them to perform, for wages, tasks which they would regard demeaning and unworthy of men in their own homes. The traditional notions of *purdah*, and impurity attached to women during menstruation and childbirth, worked against women being employed, as cooks [Mehta 1960], even though in their own homes they are solely responsible for preparing the family meal. Male cooks are also among the highest paid among servants in India. The growing feminisation of domestic work, however, points to the loosening hold of the traditional ideas of purity and impurity in urban Indian society.

In Zambia, a preference for male servants and a concomitant reluctance to employ women persists. Hansen (1989:18) uses the social construction (of the gender division of labour) argument to counter those who have used biological metaphors and theories of the household based on it to explain the concentration of women as domestics elsewhere.

From the literature what emerges as an almost required characteristic for the potential domestic worker is a certain vulnerability which makes possible an exploitative relationship based on dependence. This vulnerability arises out of a combination of what are disadvantages in the urban labour pool: a lack of education and skills, lack of resources (almost all domestics are from poor families and from a lower class background), and a cultural background which does not provide the means to choose

an occupation.¹⁸ Migration from a rural area or from another country often serves to increase vulnerability along some dimensions as for example, language handicaps, which overrides what may otherwise be advantages such as middle class origins. Simply being considered 'alien' is enough to increase this sense of vulnerability. As Cohen (1989) reports of West Indian domestic workers in New York, being at the mercy of those who are responsible for getting workers a 'green card' makes for a situation where the domestic feels helpless and victimised. This may explain why many women who work as domestics in the US have held higher status positions in their own countries (Nakano Glenn's interviewees would not think of doing the work of maids in Japan).¹⁹ Ideologies of subordination based on gender and race play a crucial role in the dynamics of the master-or-mistress-servant relationship and in the creation of vulnerability. Often there is ideological domination, especially where colonialism plays an important role.²⁰ It is no wonder that the typical domestic is a woman of lower class, more likely racially different from the employer. Glenn emphasises this vulnerability when she writes that domestic service was left open

to those lowest on the status hierarchy and those most recently arrived in the city... In industrialising and industrialised societies, domestic service seems to be the speciality of groups that are not integrated into the industrialising sectors of the economy [Glenn 1981:352, 354]

DOMESTIC SERVICE AND ECONOMIC DEVELOPMENT

There has been a great deal of interest in the relationship between domestic service and economic development, specifically, in its correlation if any, with economic growth. Those who have studied the institution within the framework of the modernisation thesis tend to see it as an indicator of the level of development and industrialisation and as a 'useful measure of development' "...where reliable data on the distribution of income and on the non-market sector of the economy are virtually non-existent" [Chaplin 1978:123]. This conceptualisation has relegated domestic service as one of the problems of an underdeveloped economy.

This approach has been criticised fairly thoroughly. Contrary to prognoses [Boserup 1970, Coser 1974], the practice of employing domestic workers does not appear to be fading as a result of economic development and industrialisation,²¹ instead the industrialisation process has been given as one of the causes for the prevalence of servanthood [Taussig and Rubbo 1983:21] as it appears to stimulate not only demand but supply as well. Empirically, it fails to explain the continued incidence, some may

say increase, of domestic workers in Los Angeles, New York and London, for example. The sectoral shifts from manufacturing to service industries, and new immigration have produced both skilled as well as unskilled workers who are channelled into domestic service. With greater numbers of middle-class women entering the labour force, there is certainly no downward trend on the demand side, even with increasing numbers of household gadgets on the market. Attempts to explain the presence of female live-in servants as a social institution which is dependent on the level of unemployment (with high unemployment leading to greater numbers of women in servitude), has been dismissed as 'economic fatalism' [Taussig and Rubbo 1983:6]. The argument is that if unemployed women are able to find work as domestic servants, it is evidence of the need for the occupation in the society and cannot be attributed to unemployment.

Though domestic service seems to have maintained its status quo if not increased, rather than disappeared with industrialisation, it is not the wealthiest countries which have the highest servant ratios but those with the largest income differentials. Curiously, arguments have been made which account for the expansion of domestic service both during periods of economic growth [Hojman 1986: 108, 110; Young 1987:365] as well as during decline [Gill 1989:119].²² It has also been argued that as a development index, domestic service does not correlate positively with growth, but "peaks at the crucial turnaround stage when Marxian expectations of endlessly accelerating misery and growing inequality cease to be valid" [Chaplin 1978:123].

Rollins's (1985) and Glenn's (1981) works suggest that formulating an indicator based on economic measures may not be meaningful where servanthood is concerned. Rather than a 'development index', which implies a quantitative measure, a high servant-to-employer ratio as an indicator of the degree of social inequality seems closer to the experience of both third world and industrial nations. Here 'social inequality' is more loosely defined (by Cock, Rollins, Hansen, Glenn and others) since it is so finely meshed with issues of race, culture and the creation of dominant ideologies.

This is not to say there have not been any qualitative changes within domestic service. In the US in the earlier part of the century a major change occurred when domestic servants started living out [Dudden 1983, Rollins 1985]. Where a trend may be emerging is in the separation of childcare from house-cleaning together with an increasing professionalisation of the service,²³ though the extent of such professionalisation is questionable. In both areas demand does not appear to be flagging. Nanny schools have multiplied both in

Britain and the US. According to Hansen (1989:297), the American Council of Nanny Schools in 1985 listed 12, and in 1986, 30 teaching and placement centres whose graduates are considered in-home childcare professionals. Also in 1986, the franchises in professional housecleaning and maid services were described as some of the fastest-growing businesses, overtaking fast food which used to hold the lead. The story is similar in Britain where nursery training colleges can assure their graduates better opportunities now, compared with 10 years ago (the ratio is 25 jobs to 5 graduates) while in London nanny agency boasts of 40 prospective employers to one nanny (*The Economist*: March 17, 1990). Romero (1988) elaborates the strategies employed by women domestic workers to gain control over what is a very undefined and contextual work relationship. She demonstrates that professionalisation of employer-worker relations and standardisation of tasks are central to the ways in which Chicano domestic workers attempt to prevent exploitation. However, from Rollins's (1985) study it is not clear to what extent such strategies are successful. The women she interviewed had negative responses about cleaning services which they saw as expensive, impersonal and rigid, and expressed a preference for the relationship they could build with an individual. In middle-class and upper-middle-class homes, black or immigrant women are the preferred work group for house-cleaning, and white women for childcare (Rollins 1985).

It is pertinent to remark here that in India industrialisation is responsible for introducing important changes in the institution of the domestic servant. For instance, in the bigger Indian cities the living-in servant is being replaced by part-time, visiting servants. Such servants perform specific tasks in the household, and they usually work for several employers. Employers find the living-in servant has to be fed and looked after and his (or her) inroads into their privacy tolerated. Further, reports in newspapers of physical attacks by living-in servants on their elderly employers have acted as a deterrent to employing them.

THE MOBILITY THESIS

The argument that domestic service provided a channel for upward mobility for rural and foreign migrants was predominant in the 1970s. It grew out of the modernisation thesis and its supporters, Chaplin (1978), Coser (1974), Davidoff (1974) and McBride (1974) to name a few, extended their findings on industrialising England and France, to non-western countries. Chaplin, the major proponent of the upward mobility thesis, writes, "Domestic service can also be viewed as the major acculturating or socialising agency for rural and foreign migrants during

the early stages of industrialisation. This period was comparable to the situation in currently developing countries". He quotes Broom and Smith (1963) who, based on studies in England, view domestic service as the principal 'bridging occupation' [Chaplin 1978].

McBride's study of 19th century France indicates that domestic service was one of the most important means by which the rural poor effected the transition to urban life. It was a transitional stage both in the lives of individual servants and in the process of modernisation of the society. At the individual level, some servants benefited from this important stage by gaining occupational skills and accumulating a dowry or working capital. Mobility within the domestic hierarchy was also possible, promotions from scullery maid to chamber maid to lady's maid for instance, or from hoot-black boy to footman. Davidoff (1974: 416) presents a gendered version of the mobility argument according to which, men were able to use the contacts they had made while in service to become shopkeepers and run services while women were more likely to 'marry up'. McBride's study supports Davidoff's thesis that women used domestic service as a means to make better marriages. According to McBride, a third of all French women may have served as domestic servants before marriage. Records at Versailles for example, reveal that 30-40 per cent of female servants married men of higher status than their own. Women who had been 'socialised' through servitude were considered better prepared for marriage and therefore made better marriages. Radcliffe (1990) observes that the assimilation of domestics into middle and upper-middle class households, even while it is 'partial and contradictory', follows a pattern of cultural incorporation. But she thinks that complete incorporation of rural migrants is impossible from her study of domestic workers in Peru.

Studies of India and parts of Africa point to the significance of the servant's role, of master- or mistress-servant relations in the larger context of the dominance of one racial and national population by another. In India, even before Mughal, then British rule, caste divisions had established patterns of dominance, and patron-client relationships existed which only became more layered and complicated with time [Tellis-Nayak 1983]. According to Rollins (1985:55), "domestic service in this context, rather than functioning as a gateway through which socio-economic marginals pass into the mainstream, functions to reinforce social and ethnic stereotypes and maintain those biologically "deviant" in the social and economic underclass".²⁴

Tellis-Nayak (1983), on the basis of study of ethnically diverse communities in India, supports the argument that servants

experience little or no social mobility. A small number use their skills to move on to semi-skilled jobs outside the home or to marginally higher-paying domestic ones, but in general, servants do not move out of their class and culture (1983:71). In fact their urban experience often creates adjustment problems. At times their marriage prospects may be adversely affected in a traditional society. Women who have worked in middle-class homes may want greater autonomy than they would have had before leaving their villages. They may begin to want different things – a life-style similar to that of their employers. Young (1987:371) explains the problem as an inability of the servant to acquire the cultural and material capital of the middle or upper class family because of her liminal relationship in it. Hansen (1989: 21) refers to the example of Christian domestic servants in Kerala state in India which illustrates the irrelevance of their knowledge gained outside of the employing households. This is also seen in the skills learned in African homes [Cock 1980; Hansen 1989] where cooks are required to learn highly elaborate European dishes which need expensive and hard-to-obtain ingredients as well as more efficient stoves and ovens all of which will not be affordable for the servant families in their homes. The highly elaborate meals which developed in colonial households served the purpose of status display of which the servant was a part [MacMillan 1986]. Smith (1973) questions the mobility thesis based on Peruvian material. At most, Peruvian servitude helps the servant to get a better job within the servant realm. A servant has little, if any hope of emerging from the lower class: "Instead of working her way up the social hierarchy, if she is lucky, she rides to the upper levels of the lower class on the shirt-tails of her husband". In sum, none of the non-western studies supports the upward mobility thesis [Hansen 1989:21]. Thus, Davidoff observes that many of the women who work as domestics "appear to be caught up in a cycle of poverty, with a lack of education and employment which continues from generation to generation. This vicious cycle leads one to suspect that domestic work may include a degree of ascription in a quasi-caste status" (1974:80).

But upward mobility is difficult to identify and measure. Women who have moved out of servitude may not want to admit to ever having been in a desperate enough situation to warrant going into it. Additionally, it is difficult to trace such movements of individuals, geographically as well as socially, since their networks may change. One way out of this problem would be to observe two or more generations in a family. This is an area which has not received a great deal of attention in the literature.

Is domestic service different from other forms of employment? Those who have addressed this question seem to have been more successful in proceeding with methods of negation in trying to conceptualise what has been referred to as a relation full of ambiguities and contradictions. Therefore, Tellis-Nayak (1983:72-73) says that it is not product-oriented, that it calls for no particular skills on the part of the servant and no precise evaluative standards on the part of the employer.²⁵ Gill (1989: 128) writes that the house-worker is neither a labourer in the traditional sense nor one who carries out the unpaid domestic tasks of wife or mother. The tensions arising from these ambiguities are played out and recreated through a complex process of conflict and accommodation that characterises the (mistress-servant) relationship and which are closely related to the class and ethnic background of specific social actors.

As a category it is an in-between. Radcliffe (1990) reports that the very term used to address the servant which is, 'cholo', refers to a person who has left his peasant origins but it is yet not integrated into modern society and culture.²⁶ The term also denotes the marginal, ambiguous status of those who have no fixed niche in the stratification system. Aubert (1955) addresses this in-betweenness when he writes that the role of the housemaid "wavers between the occupational models of *gemeinschaft* and *gesellschaft*". Chaplin (1978:99) draws attention to the blurred line between kinship, apprenticeship and domestic service in mid-19th century England while addressing the 'lending of the children' which involved both welfare and exploitation. Young (1987:366) in a discussion of how the ideology of the family helps to mire an essentially exploitative relationship, writes that domestics in their patron families are at the same time members as well as non-members, standing simultaneously within the familial boundaries yet outside them. Their case exemplifies the linkage of domestic and collective institutions that are bonded by an ideology of paternalism and dependency. The essence of their position is that they are part of a household which includes more than kin [Cock 1980]. It is an effective form of marginalisation where the servant though crucial to the patron's family as well as to society's maintenance, is retained as a marginal member of the social totality [Young 1987:375]. Another way in which the domestic servant is placed in a marginal position is that a good part of his or her real income is provided in kind. Instead of being able to engage in the essence of modern social order, she participates only indirectly through her master's household.

The token wage received is akin to pocket money [Cock 1980:102].

It is the ideology of the family with its stress on the commitment of close kin, as well as on duty and devotion within the protected boundaries, which conceals and helps to bring about the marginal position the domestic servant occupies in the private sphere [Young 1987:370]. The idiom of the family as inclusive, just as a 'natural' age-based division of labour and power, serves to structure a relationship of inequality indeed, of exploitation – one powerfully legitimised by the church and the state. Young women pass from the paternalism of their own familiar environment to the paternalism of the new working environment [Young 1987: 365] where work is seen as a natural contribution and not a form of wage labour [Radcliffe 1990]. Family ideology and paternalism has made possible a subordination of a more personal and pervasive kind. Unlike an enterprise where the subordinate may defer to the technical expertise of the superior, the domestic worker's deference is to paternalistic status. Since the identity of a servant was a lasting quality ascribed to a person irrespective of his or her choice (like caste), the relationship to the master or mistress was one based primarily on status and not on contract [Aubert 1955 152].

The role of family ideology in structuring the master-servant interaction has led to greater importance being placed on the personalities of the parties determining the success and satisfaction in the relationship, more than in most other occupational relationships [Aubert 1955; Gill 1989; Katzman 1978]. Chaplin (1978:99) observes that domestic service, though essentially manual labour, can be as demanding of personality involvement as selling, and of character as clerking in a bank. In addition, different types of domestic work require different qualities: "A butler, or a chambermaid waitress who is tall and comely may have access to a larger number, and to better places than one who is short" [Haynes 1923:428 quoted in Chaplin 1978]. Rollins in disagreeing with the finer points of Chaplin's argument, supports the larger argument he makes. She notes that personal qualities considered negative otherwise may be looked upon favourably where the relationship involves racial difference. Among her interviewees many remarked that they received better treatment if they dressed poorly and appeared excessively deferential. Rollins herself experienced hostility from employers when she did not assume the demeanour of a grateful subordinate, which included a carefully constructed 'down at heel' appearance.²⁷ Rollins's observations confirm the importance of the personal qualities of the domestic worker in an arrangement where

the nature of the relationship between superior and subordinate, is more important than the completion of tasks (1985:122). This personalism is expressed in the qualities considered desirable by the employer, such as humility, lowliness, meekness and gentleness, fearfulness, respectfulness, loyalty and good temper [Davidoff 1974:415], and in the prominent complaints which concern the servants' supposed dishonesty, irresponsibility, laziness, sullenness, requests for free time, illness and possible pregnancy... [Tausig and Rubbo 1983 15].

Other aspects of the personalised nature of the work are diffuse and capricious expectations which strengthen and legitimise dependency and its ascription [Tellis-Nayak 1983:72-73]. Tausig and Rubbo (1983:20) have identified two separate dimensions of the capriciousness of which servants complain. One is associated with the dependence on the mistresses' mood changes, itself a result of the highly personalistic quality that runs through the definition of the servant's tasks in a stable, long-term arrangement. Secondly, there is the capriciousness which lies in the contradiction of being an unstably employed but personally involved employee, without any or most of the security that the traditional servant was promised. Practically, unlimited duty to obey the master is another indication that the relationship is functionally diffuse. The particularistic pattern has made it impossible to legitimate a defence of the private sphere by the claim that the job is done according to generally accepted, objective standards of occupational performance.

Another dimension of the personalised relationship between master and servant is intimacy. This is highlighted by Srinivas (1987:87-88) who quotes the instance of a loyal *jua* servant being given the honour of burial after death in the master's ancestral graveyard. He was being treated as a member of the master's lineage.

But the nature of master (mistress)-servant relationship is undergoing radical change in India under the pressures of urbanisation and industrialisation. A common complaint of middle class housewives in India is that they are unable to get any longer reliable and efficient servants let alone loyal and honest ones.

SERVANT AS STATUS SYMBOL

The servant as deference-giver provided another service – that of status symbol – which set servitude somewhat apart from other occupations. The function of the domestic as status-giver and the use of the servant role to reinforce the superior status of the employer and to create her identity in opposition to that of the servant's, are important ways in which social hierarchy is maintained. The role of servant as status

symbol goes back at least to the Roman empire where according to records, some slaves performed no work, but functioned solely to attest to their owner's status and worth... [Rollins 1985:105]. In industrialising England and France, lackeys, coachmen and footmen, often hired for their looks and dressed in ostentatious costumes, functioned solely to impress others. For the employer to be able to 'waste' well-built male servants was seen as evidence of his extreme wealth [Douglas and Isherwood 1978; Vehlen 1974]. Leonore Davidoff who has explored the servant's role as 'deference-giver' and the formation of 'deference-occupations' in some depth, remarks that employing servants is the surest way of establishing social superiority. The activities of such households were dominated by the concern with social placement and social closure which led to 'a great upsurge in display of material objects' as well as 'elaborated rituals of etiquette' (1974:411). Rituals are known to become easily an end in themselves without awareness of the symbolic or mystical properties of the actors. This elaboration of ritual takes on the features of a dramatic performance, when the occasion is a ceremonial performance such as a dinner party, private ball or houseparty.²⁸ Deferential behaviour takes on exaggerated forms such as walking out of a door backwards, maintaining complete silence while performing tasks, never sitting down in the presence of an employer and never initiating an action or speech [Davidoff 1974:415].

According to Chaplin (1978:117) "... the existence of low-paid domestic service and the psychological gratification arising from membership in the top status group in a multiracial society became realities difficult to relinquish". In the colonial household, servitude assumed many of the features of the relationship between the ruler and the ruled [Hansen 1989:302; MacMillan 1986:143-145]. In South Africa servants provided a crucial behavioural validation of apartheid,²⁹ while to the Mughals, and then the British in India, servants were seen as necessary for the prestige of the empire.

Margaret MacMillan's narrative provides some penetrating insights into the kind of everyday situations which arise in a traditional caste society during colonial rule. She writes that among other things that the British had 'picked up' from India was that the number of servants was a measure of status. Whether the British did indeed get this idea from India or whether it was something they came to India with, can be argued but the point is that since the servants thought so as well, employers were under considerable pressure to hire more every time the master got a promotion (1986:146). In their preoccupation with upholding the status of the empire, the British were continuously making comparisons between

the empire and the household, which became a symbolic microcosm. If servants were badly trained, it reflected on their master's ability to rule the country. British housewives were therefore expected to supervise their servants much as their husbands supervised their troops,³⁰ and housekeeping resembled a battle more than it did anything else. Guides to housekeeping sounded more like military manuals (1986:143). Servants were to be treated with firmness and constant vigilance. *The Complete Indian Housekeeper and Cook* stated that "an untidy mistress invariably had untidy, idle servants". If a memsahib lost control of her household, it was for the same reasons that the British might one day lose control of India. Servants became a necessary burden to the young housewife who was constantly judged by how well her household staff performed, to create the stately atmosphere that was expected of those in command. At the lowest levels of British society, even the wives of ordinary soldiers or men who worked on the railways, had a servant or two. The presence of a large retinue of servants made it easy to be formal while the need to uphold the dignity of the Raj made it desirable [MacMillan 1986:146].

Katzman (1978:384) writes that the ability to employ servants is still a mark of social status and class position to some, although this attitude is less prevalent than in the past. "... rather than seeking an intelligent resourceful independent worker, they may want a servant to whom they can feel superior and dominating. Rollin's work addresses this aspect of domestic service quite extensively. She concentrates on questions relating to the creation and maintenance of hierarchy and distance as well as the importance of construction of difference [See also Radcliffe 1990] and its role in the formation of the employer's identity.

HIERARCHY, DISTANCE AND DIFFERENCE

The creation and maintenance of hierarchy and distance in the master-servant relationship is attempted at various levels – verbally, spatially and in the exaggerated formulation of difference from which identities are constructed (Cock 1980; Davidoff 1974; Hansen 1989; Rollins 1985). Hansen explains that a critical component of the relationship was the construction of the servant as different, to the extent that "Servants and employers became each other's other" (1989:302) and for this purpose inequality was accentuated in clothing, speech and demeanour (1989:71).³¹ Difference was interpreted as inferiority by employers who formed their identity in opposition to their servant's. This is cited as one of the main reasons for the extraordinary tensions and conflicts inherent in the interaction [Rollins 1985]. In Peruvian differences are exaggerated. Employers are Hispanicised or aspire to European life-styles

while employees are mostly Quechua-speakers belonging to indigenous peasant culture. Employers view them as a homogeneous and inferior group though there is a great diversity of provincial cultures [Radcliffe 1990:384-85].

Visually, difference is created by giving servants uniforms which is also a means of depersonalising the individual [Cock 1980; Hansen 1989], or by expecting the servant to 'dress down' in keeping with a low-status profile [Rollins 1985]. The non-use of shoes when inside set the servant apart from both employer and fellow African. Secondly, the language used to communicate with servants was altered [Hansen 1989]. Tellis-Nayak (1983:70) refers to a 'status reflective vocabulary' where the "discourse utilises, at a micro-level, the same grammar of hierarchical relatedness found in caste society". This supports Hansen's pronouncement of 'Kitchen Kalfir' being a hybrid language of subordination consisting mainly of command and obey expressions. Gill (1989:129) also comments on employers creating social distance by the imposition of certain linguistic practices. Reference to the household worker as 'chica', 'hija', or 'muchacha' regardless of the women's age, suggests that she is childlike and irresponsible. Servants' names may also be changed and garbled into object names such as "Sixpence, Wireless, Pumpkin, Bicycle or Cabbage" [Hansen, 1989:71]. Cock (1980) reports a distinct change in tone of voice when employers address servants with the pitch rather flat and staccato and the words enunciated slowly and distinctly as if one were speaking to a child [see also Hansen 1989:66]. Servants may not take part in the ordinary flow of conversation. They may be interrupted but may not interrupt unless the interruption is to enquire about the work. In India languages are used to form a hierarchy of communication modes. Employers are known to address servants in the regional language in the presence of their guests even if the servant knows the national language or English. The regional language becomes the 'command' language, while English may be used to create class barriers. It is not unusual to see an urban middle-class person conducting a three-way conversation with two languages appointing himself 'middleman', retaining command over the servant and making himself a 'servant' to his guests. These interactional patterns, in addition to the servant's own demeanour of not speaking unless spoken to, of being present without being seen, effectively reduce the individual to an object. (It is interesting that in parts of north India, the cook hauling from a brahmin caste is addressed as 'maharaj' by the employer but the grandiloquent mode of address in no way enhances the cook's status while it makes clear to everyone that the food

is cooked by a brahmin and therefore acceptable to one and all.)

A third dimension of status differentiation is the spatial one as seen in the British television programme, 'Upstairs-Downstairs' where master and servant have their separate realms which are spatially and hierarchically juxtaposed. According to Rollins (1985: 171, 172), spatial deference takes two main forms in domestic service: the unequal rights of the domestic and the employer around the other's body¹² and the controlling of the domestic's use of house space... Controlled use of house space converges with interpersonal spatial deference in eating arrangements, recreating and reinforcing both the domestic's place in the kitchen, and the intrafamilial hierarchy of worth. Cock's (1980) interviewees complained of having to eat outside the house, in the kitchen or near the lavatories, calling it the most dehumanising experience of all: Tellis-Nayak (1983:69) observes that servants eat their meals sitting on the floor, often out of sight, after the family meal; Rollins (1985) reports that while it is not unusual for an all-day or live-in worker sometimes to have lunch with her female employer in the kitchen, it is practically unknown for the domestic to eat in the dining room and when the husband is present. The message is clear, the domestic's place is at the bottom [Rollins 1985:172] in the family hierarchy as well as the social hierarchy.

Spatial hierarchy is expressed in the lack of private space – servants have no room of their own, they often sleep on the kitchen floor. In wealthier households where they do have a 'room', it is barely furnished, if at all, and may be used as a storeroom for mops and brooms, spare fuel for the stoves or cleaning rags. The household worker's confinement to this room and the kitchen, when she is not working in some other part of the house, underlines her inferior position. Hierarchy is seen also in the 'outhouse' or lavatory the servant uses, and the back door or side gate through which she enters or leaves [Bunster and Chaney 1985; Cock 1980; Tellis-Nayak 1983]. Gill (1989:128) writes "...employers use a variety of mechanisms to define the distinctiveness and otherness of the household worker... in part demonstrated by the maintenance of "servant's quarters"..." Hansen (1989:65) extends the symbolic expression of hierarchy into the layout of the grounds where the servants' quarters were built along sanitary lanes from which nightsoil and garbage are collected. The colonial bungalow, often designed with servants in mind, had long corridors separating the more 'public' from the 'private' areas of the house. The servants' domain – the kitchen, pantry and back verandah – were connected to the rest of the house by a long covered corridor often shut off by double

doors. The separation of spheres was complete.

SUMMARY

An overview leads one to emphasise the construction of difference as pivotal to the master-servant dynamic. In this creation of difference, race and ethnicity have played, and continue to play, a central role. Where superior and subordinate relations are influenced by inter-racial, inter-ethnic and multi-cultural factors, the interaction acquires several additional levels of complexity based on cultural, as well as on class and gender domination. Yet as Rollins (1985) remarks, there are few studies of contemporary societies which explore these complexities. A more complete understanding appears to rely on such studies being carried out.

The persistence of domestic service is not to be understood as an "anachronistic survival of feudal or pre-modern features into the late 20th century" [Hansen 1989:294]. To make such an analogy is misleading since personalism, asymmetry and dependence which characterise the relationship of master (or mistress) and servant, are not restricted to a particular mode of production but develop under a variety of socio-economic conditions. Pre-industrial and feudal analogies also tend to obscure the new guises in which domestic service is appearing and of the processes that are bringing them about. These analogies do not explain why domestic service appears to be growing as an occupation in the advanced capitalist systems as well.

The argument that domestic service is closely tied in with social inequality needs to be systematically explored. However, it is difficult to measure social inequality in terms of widening income differentials alone since income differentials themselves may be an indicator of inequalities reinforced by social and cultural ideological systems.

Some say domestic service has already changed by becoming a more short-term, rather than a life-term occupation and by becoming more 'contractual' and less patriarchal and secure [Taussig and Rubbo 1983:6-9]. However, servants appear to fill several needs, only a few of which are purely 'economic'. An example of such a role is that of the status-giver providing a background against which the employer's household position and identity are established. For the growing middle-classes, servants are seen to provide a means by which they are able to establish their class position as well as articulate with other sections of society. In this connection it may be noted that the rapidly growing tendency in developing countries for educated, middle-class women to have careers of their own, increases the demand for servants. And this in spite of increasing resort to gadgets, and growing nuclearisation

of the middle-class family. For these reasons it is unlikely that the demand for servants or for servant-like roles will disappear with economic growth in societies which have incorporated the servant into their cultural structure. A question which arises in this context is whether other occupations will take on the qualities of the master-servant relation involving a high degree of personalisation and de-skilling which some argue has already taken place with increasing computerisation leading to fragmentation and mechanisation of tasks. Rollins (1985:203) draws attention to the ideological function of domestic service which she attributes to its remaining 'a profoundly conservative element' based in rituals of deference and maternalism that are as central to this occupation as are low pay and low status. This ideological function cannot be overestimated in its importance to the perpetuation of the occupation and therefore the perpetuation of a social system of class, gender and ethnic stratification.

A review of the literature reveals a focus on the one-sidedness of the relationship – the domestic worker as an oppressed mental, fully exploited by the employer. This view leads to either a focus on the material aspects of the relation or goes into questions of power and dominance. There is need for an exploration of complexities of the master-servant relationship at the interactional level with a sensitivity to the role of culture. Radcliffe presents the cultural conflict thesis: Her study (1990:390) discusses the role of culture in creating barriers to the full integration of the servant in the employer's culture which is the accepted urban culture. Servants' unions have formed to fight the culture war. "Pamphlets titled 'In Search of Culture' encourages domestics to protect and develop their peasant customs in the city. Many domestics are influenced by a popular culture developing in Peru which provides a cultural alternative to 'official nationalism'" (1990:390). This leads to the question: If employers use servants as status symbols and in the construction of their own identities, does the culture of the servant develop in opposition to the employer's culture? What barriers does this create to the servant's mobility? How does it explain Tellis-Nayak's (1983) observation that servants may experience adjustment problems in going back to their life-styles in villages because they have absorbed the world-views, and emulate the life-styles of their employers? The other question is: how effective are domestic workers in using their culture to resist the employer's culture? Are servants able to reverse the symbolism, are they able to create their culture? These questions call for detailed studies of employer-servant interactions at the household level.

Notes

[I would like to acknowledge the help received from the following in connection with preparing the paper for publication: M N Srinivas, A M Shah and M N Panini for reading an earlier draft and making suggestions; V S Parthasarathy for obtaining figures of domestic workers from the Census of India Reports; and P Ramachandran for typing the final draft.]

- 1 William Blackstone, *Commentaries on the Laws of England*, Vol 1, Ch 14, p 422, quoted in Aubert (1955:152)
- 2 From 'Domestic Service in the Latin American Fotonovela', in Chaney and Castro (eds) (1989)
- 3 Davidoff (1974:416) identifies escape into the fantasy of the romantic novel as one form of resistance
- 4 In contrast to the anecdotes of the British coping with India and Indians in *Women of the Raj*, Margaret MacMillan provides this anecdote of inter-class interaction. In 1992 Kathleen Wilkas was travelling to India to take up a post as governess. She met a man and 'in a few days under a full moon on the Red Sea we became engaged, much to the delight and interest of many people on board ship'. Not everyone was delighted. 'In my cabin there was a rather senior lady who, rather looking down on me as a governess, said, "Oh, I hear you've got engaged to young Griffiths. You've done well for yourself haven't you. Don't you know, he is one of the heaven-born-the Indian Civil Service!"' (1986:113)
- 5 In the 60s a study carried out in the US revealed that as an occupation domestic service had ten times as many people (more than 2 million) as did coal mining [Chaplin 1964, 1969]
- 6 See Radcliffe (1990:390). In Peru domestic workers are recruited by relatives. An urban godparent may place a young peasant girl in an urban household. No formal contracts are drawn up. Agencies are only infrequently used in recruitment.
- 7 "In 20th century America it has been an occupation 'so stigmatised that it can hardly attract potential recruits among ordinary citizens and must increasingly turn to a pool of otherwise undesirable foreigners'" [Coser 1974:39].
- 8 "The location and nature of domestic work was part of the problem itself. Both domestic service and working class marriage are exceptionally elusive areas to study. So much of their activity took place in private areas" [Davidoff 1974:406].
- 9 *The Economist* (March 17, 1990) comments on the nanny shortages in Britain thus: 'Ever since the disappearance of the servant class, relatively low wages for women and a regular supply of northern girls with low expectations has kept the south-east fully staffed'
- 10 Cohen (1989:171-196) makes the link between the ideological construct which separates public from private which she says prevents the recognition that domestic work, performed by women in homes, is work. Hence much of it is in some ways 'invisible'. Anthropologists have charged this conceptual separation of public and private with ethnocentrism. They argue that it is only in western societies that the public-private distinction becomes significant because of capitalism's separation of home and work. In non-western societies it is not clear that this separation is valid. However, in the contemporary study of domestic service this distinction does seem to be appropriate. Middle class households which employ servants are locked into the workings of the larger economy and are not completely untouched by western culture and ways of life.
- 11 Cock (1980:66-67). All the domestics in the Eastern Cape study said they found domestic work boring rather than interesting. It has been described as "barbarously unproductive, petty, nerve-wracking, stultifying and crushing drudgery". Although the tasks that make up housework are dissimilar there is said to be a sameness about them, which derives from their frequent need to be repeated, their lack of intrinsic meaning and the impermanence of the goals they achieve." P Mohammed (1989:162) notes that "This kind of work, repeated over and over becomes monotonous, mindless, uninspiring. No evidence of productive labour remains to show the effort that has gone into it"
- 12 "The Irish seemed more lower class because they were in domestic labour, and the work itself seemed more menial because the Irish dominated it. The employer's low regard for this 'women's work' can combine with her own sexism, racism and class prejudices to further degrade the work and groups already subordinate in the 'three structures of power' in the US, women, people of colour and the lower class" [Rollins 1985:184]
- 13 MacMillan reports that awkward scenes took place when the British 'mehsahib' ordered a servant to perform a task which he or she could not do because of caste. Minnie Blane in a letter complained uncomprehendingly to her mother. "Actually the other day I desired my table servant to bring me the drawing room lamp to clean as I take charge of them. He refused, saying he would lose caste to touch it. Fool! I got so angry, and after a hard battle got my way, but really they are enough to drive one mad!" (1986:144)
- 14 A cursory review suggests that these ideas may not be peculiar to Indian society. According to Palmer (1989:66), social disdain for manual labour which were manifest in the job hierarchies of the corporate realm began to pervade the home as the middle class wife turned over some tasks to machines and others to her servant. Exacting heavy labour from the domestic became essential to protecting the health and refinement of the housewife. Cock reports of South Africa, "For both Red and School Xhosa, domestic work is contrasted unfavourably with so-called clean occupations" (1980:71). And Shellee Cohen quotes Beverly Powell, one of her respondents from Jamaica: "When people start looking down on you for cleaning up their messes, then it starts hurting" (1989:182). But even before ideas of hierarchy in the corporate realm were pervasive, Davidoff's findings of 19th century England reveal that there was a strong stigma attached to domestic work. Those who were closest to defiling and arduous activities were, whenever possible, to be kept out of sight. In great houses, their very existence was denied. Upper servants were themselves protected from such defiling activities by having lower servants wait on them (1974:413).
- 15 One of Glenn's case histories reads: Mrs Tanabe, who grew up in Bay Vista, explained that her family could not afford to send her to college, so she worked as a type-sorter on a Japanese newspaper in San Francisco. A year later, she said, being an only child I felt like I needed to learn how to do different home-making (things). So I applied for a school girl job on a part-time basis. And that was interesting.. I didn't even know how to boil water. You know when you are an only child, your mother does everything. You learn quite a bit. The lady of the house say, 'make me a cup of tea'. So that was interesting."
- 16 Traditional Japanese education for girls ended with several years of training in domestic arts. "It was customary for daughters of prosperous rural families to spend a few years serving cultured urban households to acquire social graces" [Miyakawa in Glenn 1981]
- 17 Census of India 1971, *Series I, India, Part II-B(IV), Vol 1, General Economic Tables (Table B-V)* and Census of India 1981 *Series I, India, Part III-B (V), General Economic tables*. Government of India, New Delhi; and see also Tellis-Nayak, V. *Current Anthropology*, 23(1), 1983
- 18 Katzman (1978:271) reports of the US 'domestic service drew less from women who chose service and more from those who due to race, ethnicity, lack of education or marital condition had no choice'
- 19 Only one respondent of Glenn's had worked as a servant in Japan. She was forced into domestic service because her stepmother did not want her in her father's home (1981:383).
- 20 MacMillan (1986:144) reports that as late as the 1920s guides to housekeeping were warning readers not to expect too much from the Indians who worked for them as they were conservative and resistant to innovation and change (1986:144)
- 21 In Latin America, where a great deal of the existing research on domestic has been carried out [Bunster and Chaney 1985; Chaney and Castro 1989; Gill 1989; Hojman 1986; Jelin 1977; Nett 1966; Smith 1973; Taussig and Rubbo 1983; Young 1987] maids continue to be important as a social group, both for the working class women and for middle- and upper-class women who depend on maids to maintain their own status, and increasingly their own ability to enter the labour force [Flora 1988:144]. Taussig and Rubbo report of Colombia that with the relatively increasing affluence of the urban middle-class, the only group to have markedly improved its position since the 1930s, demand for servants has done more than increase. They attribute the prevalence of servanthood in Lima to the industrialisation process itself (1983:21) and state that there is no good reason to believe that servanthood will decline as a result of industrialisation and economic growth as previously patterned. Rollins (1985) reports the growing preference for foreign-born domestic workers in the US and the growing number of maid services, while in India, the servant continues to be an unquestioned part of the urban household even for the lower-middle income family.
- 22 Gill attributes the persistence and increase of salaried domestic service in La Paz to the prolonged economic crisis and the dependent nature of the Bolivian economy and entrenched

gender biases which have precluded the absorption of women into formal sector employment. A combination of these factors have forced female Aymara Indian immigrants from the countryside to seek wage employment in the homes of Criollo women in the city (1989:119)

- 23 Taussig and Rubbo (1983:6) have a more pessimistic interpretation: "In keeping with the transformation of all economic relations into capitalist contractual ones, servanthood becomes less familial and more commercial, creating a new pattern of freedom and submission"
- 24 Rollins's observation may not fully apply to servants in colonial India for proximity to British masters provided an opportunity for servants to secure employment in the lowest levels of the government or in the organised sector. Salaried employment was status-conferring, as also working for the European. This latter point was particularly applicable to the sections of Indian society which provided servants. Unfortunately, systematic studies of mobility among domestic servants are lacking for the colonial period as well as contemporary India
- 25 Also see Gill (1989:130) "No criteria for evaluation" and Aubert (1955:150), Mehta (1960:282).
- 26 Radcliffe (1990) also refers to the partial assimilation of rural migrants in Peru into the urban 'national' culture.
- 27 "The question of the importance of domestics' appearance first occurred to me when I was working as a domestic. Not only did I feel no encouragement for grooming and working at attractiveness, but unlike any other type of job I've held, I felt the worse I looked (short of unhygienic) the more my employers liked it. The female employer preferred the presence of another woman whose appearance as well as other attributes, was inferior to her own" (Rollins 1985:200)
- 28 MacMillan writes that dinners and dances assumed grand proportions in India largely because of the presence of servants. At the grandest dinners, servants waited behind every chair; the hostess borrowed extra ones for her guests, as she borrowed cutlery and cooks (1986:164)
- 29 "The humble domestic servant, dropping a cup at the end of a ten hour work-day, whispering 'master' and 'madam' when summoned, perpetually insolvent, occasionally drunk, meets all these needs. She is the dependent whose homage is balm and honey, the instrument which frees her employer for the good life and the justification for apartheid" [Wisson and Weil 1971, quoted in Chaplin 1978:116].
- 30 At the upper end of the social scale, the wives of Viceroy and Governors had armies of servants. When Lady Lytton arrived at government house in Calcutta in the late 1870s, she discovered that she had a staff of some 300 Indian servants, including 100 cooks.
- 31 Radcliffe (1990:384) elaborates on this theme of differentiation. In Peru the gap between 'western' and 'peasant' culture is perceived to be large. Employees are faced with a cultural milieu which is often unfamiliar and to which they are expected to adjust. During the course of employment ethnic differentiation may be reduced as the employee 'adapts'. However,

ethnically derogative terms and an awareness of cultural difference is maintained throughout employment.

- 32 MacMillan (1986:89) narrates an incident which illustrates Rollins's point: "A memsahib described to J R Ackerly what had happened when a servant tried to warn her that she was about to step on a particular poisonous snake. She had been too sick to pay attention to what he was saying. 'Then the servant did a thing absolutely without precedent in India - he touched me - he put his hand on my shoulder and pulled me back'. Although she recognised that he had saved her life, she told Ackerly, 'I didn't like it all the same, and got rid of him soon after' "

End of Demographic Transition by 2003 AD?

P N Mari Bhat

I read with interest the recent exchange between K C Seal and P P Talwar [1] and V Gowariker [2] on the possibility of India achieving the replacement-level fertility by the year 2003. As the author of a recent paper on a similar theme in this journal [3] I feel obliged to make a brief comment. Like Gowariker, I am not one among those experts in India or abroad who assert that the expenditure incurred on family planning over the last four decades had gone to waste. But I do consider Gowariker's prediction that birth rate in India would reach 21 per thousand around 2003 as too optimistic. Given the eminence of the person making this forecast, it has the potential to create considerable confusion all around. Hence we must examine the evidence before us as carefully and as dispassionately as we could.

Gowariker states that his prediction is based on the assumption that roughly the same order of decline in the CBR that was observed between 1981 and 1991 would also pertain to the period 1991-2003. This raises two questions. (i) did the extent of the decline he assumes really occur during the 1980s?; and (ii) how justified is he in assuming the same order of decline to the 1990s and beyond. On the first issue, it is intriguing to note that Gowariker assumes a birth rate of 37.2 per thousand for 1981 when in fact the estimate from the Sample Registration System (SRS) was 33.9. He however assumes that birth rate was 29.5 in 1991, which is identical to the SRS estimate. Thus if the SRS had registered a decline of 13 per cent in the CBR between 1981 and 1991, Gowariker assumes that the decline was 21 per cent during the same period.

My analysis of the results of the 1981 and 1991 Censuses did reveal that the SRS was underestimating the birth rate at the beginning of the 1980s and this bias had disappeared by the end of the decade. But the estimated under-registration of births in the SRS was only about 3-4 per cent around 1981, which would give a birth rate of around 35 per thousand. Gowariker gives no explanation as to why he thinks the birth rate was 37.2 in 1981, on the validity of which his prediction so critically hinges.

On the second issue, it should be noted that transition, by definition, signifies a break from the past, and thus during its course the past may seldom foretell the future. However, under certain unique conditions, it may so happen that macro trends for the past may remain valid for a limited period in the

future, even though each of the actors within the population may be behaving quite differently than what they (or their predecessors) did earlier. Such a possibility cannot be ruled out as far as the birth rate trends are concerned at the all-India level. During the 1980s, it was the states in southern India that experienced rapid fertility declines. But many areas in the south are expected

to enter the post-transitional phase in the 1990s, hence birth rate declines there are bound to slow down. Thus future declines in fertility would have to be mainly driven by the large northern Indian states where the reductions have not been that visible so far. It is expected that fall in fertility in the north would gain momentum in the 1990s but by how much, nobody can be very certain. According to the SRS, the four northern Indian states experienced an average fall of 2 per cent in the birth rate in the first half of the decade 1981-91, and 8 per cent during the second half of the decade (see the table). Though this suggests a significant

TABLE. TRENDS IN CRUDE BIRTH RATE IN FOUR LARGE NORTHERN INDIAN STATES DURING 1980s

State	Crude Birth Rate			Percentage Fall	
	1980-81	1985-87	1990-92	1980-81 to 1985-87	1985-87 to 1990-92
Bihar	38.1	36.9	31.9	3.1	13.6
Madhya Pradesh	37.7	37.7	35.7	0.0	5.3
Rajasthan	37.9	37.1	34.4	2.1	7.3
Uttar Pradesh	39.2	37.7	35.8	3.8	5.0
Average	38.2	37.4	34.5	2.1	7.8

acceleration in the fall in fertility, the trend is probably exaggerated owing to underestimation of the birth rate at the beginning of 1980s in Rajasthan and at the end of 1980s in Bihar. Because of mutually offsetting effects of the expected acceleration of fertility decline in the North and its deceleration in the South, anything exceeding a 1.5 per cent fall per annum in the average Indian birth rate during the 1990s ought to be regarded as overly optimistic. Even if we assume a rate of decline of this order, the birth rate would be around 24 per 1,000 in 2003 instead of 21 per 1,000 predicted by Gowariker. He may wish to take solace in the fact that the implied difference is not much larger than the 10 per cent error allowed by him; but it is only this error of 10-15 per cent that separates his prediction of replacement-level birth rate in 2003 from the more conservative forecast of reaching the same level about a decade after. If Gowariker is conceding an error of this magnitude, his position cannot be regarded as radically different from those of his adversaries.

The debate as to whether India's population would cross the one-billion mark by this century or not is only of academic interest as everyone seems to agree that it is bound to happen sooner or later. The exact date of achievement would not only depend on the trend in birth rate but also on the trend in death rate – especially that of AIDS-related mortality – and on the extent of under-enumeration in the 1991 Census count.

It is also not necessary to take seriously the debate on whether India's population would exceed that of China's. For, the fall in fertility does not stop suddenly after reaching the replacement-level (i.e., two children per woman). It usually falls and remains at levels below replacement for considerable lengths of time leading to a phase of negative growth rate of population. It was thought that this was mainly due to a 'period' effect (i.e., women of all ages postponing childbearing to a later time) and cohort fertility would generally remain very close to the replacement level (because of a period of 'making-up' when period fertility rates rise). However, the western experience has proved this otherwise. The completed total fertility rates for women born in 1955 – the most recent year for which the figures could be computed – were significantly below replacement level in a number of west European countries, most prominently in the former Federal Republic of Germany where it was only 1.6 births per woman [4]. Hence it is quite conceivable for India's population to exceed that of China's for a short period of time and then fall below it, even to a level under one billion if fertility levels stay below replacement for long periods of time! Any estimate of the ultimate size of India's

population (or that of China's) made at this juncture has a wide margin of error.

General Editor: Ashok Mitra

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India. The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth. Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

Essar Oil Limited

Registered Office : Essar House, 14 Haddows Road, Nungambakkam, Madras 600 006
Tel : 8279517 Fax : 8250014

Simultaneous-and-Unlinked Public Offer Of: 3,70,00,000 Equity Shares of Rs. 10 each for cash at a premium of Rs. 35 per share aggregating Rs. 166.50 crores and 8,68,42,050 - 12.5% Secured Redeemable Optionally Fully Convertible Debentures (OFCDs) of Rs.190 each for cash at par aggregating Rs.1649.99 crores

HIGHLIGHTS

- 1 Member of the **ESSAR** group — one of the largest industrial groups in India
2. An existing, profit-making and dividend paying company with a track record in the upstream Oil and Gas industry-contract drilling and offshore construction
3. Company has the largest fleet of drilling rigs in the private sector in India (Source Investment Week, September 20-26, 1993)
- 4 Energy and Offshore divisions of the company have bagged and executed several international drilling contracts amidst stiff competition
- 5 The proposed 9 MMTA grassroots refinery project would enable Essar Oil to emerge as a fully integrated oil company
6. Refinery location — Vadinar, an all-weather deep draft port which handles major part of India's Crude Import
- 7 Site Clearance from environmental angle and No Objection Certificate obtained from the Gujarat Pollution Control Board
- 8 Demand for petroleum products expected to grow at the rate of 6.9% p.a (Source Indian Petroleum & Natural Gas Statistics, 1994 and Planning Commission document)
- 9 Technology tie-up with UOP Inter Americana, USA and appointment of ABB Lummus Crest Mauritius, as Project Management Consultants on single point responsibility basis
- 10 MOU with Indian Oil Corporation Ltd (IOC), India's largest oil company for marketing of petroleum products
- 11 Easy Liquidity Listing on Madras, Bombay, Delhi, Calcutta, Ahmedabad, Rajkot and Vadodara Stock Exchanges and on the National Stock Exchange (NSE)

RISK FACTORS

Internal

- 1 The Company's current business is secured on the basis of tenders in a highly competitive scenario in domestic and international markets. Future revenues of the energy and offshore division are based on the company securing further contracts, as only part of the revenue projections are covered by the contracts on hand
- 2 The company proposes to raise funds to

Minimum Application : 200 @ Rs 45/- per share for Equity Shares

Payment for Equity Issues : 50% on Application 50% on Allotment

Minimum Application : 100 Debentures of Rs 190 each for the OFCD Issue

Payment for the Convertible Debenture Issue : 25% on Application 25% on Allotment Balance in 2 calls over a period of 24 months

The OFCDs can be converted into 400 shares, of which 200 shares will be compulsorily converted & the remaining 200 shares will be converted at the option of the investor

OFCD - Conversion Terms

Face Value of OFCD : Rs 190 comprising 3 parts

Part A of Rs 40: To be converted into 1 Equity Share of Rs 10 each at a premium of Rs 30 per share on allotment

Part B of Rs 45 : To be converted into 1 Equity Share of Rs 10 each at a premium of Rs 35 per share at the end of 16 months from the date of allotment

Part C : Option to either convert into 2 equity shares of Rs 10 each at a premium of Rs 42.50 per share at the end of 32nd month from the date of allotment OR Retain as a non-convertible portion with an increased interest

Interest

- 1 @ 12.5% p.a payable on the paid up value of Part 'B' and 'C' from the date of allotment to 32nd month
- 2 If Part 'C' is retained as an NCD, @ 14% p.a from the 33rd month of the date of allotment till redemption i.e. 96th

Promoters, ICICI and IFCI subscribing to the OFCD at the same price of Rs. 190 on firm basis.

the extent of Rs 1625 crores for the refinery project from Financial Institutions/Banks/others by way of Lease Finance, Foreign Currency, Suppliers Credit, Euro Debt Bonds, External Commercial Borrowings and a Euro Issue of Equity which are yet to be tied up. Exchange rate fluctuations and interest rate variation, if any, on account of the above could affect the project cost estimates

3 The Company alongwith ONGCL as co-respondent has received two Show Cause notices from the Customs Authorities valued at Rs 11.83 crores which are being contested

4 The requirement of funds of Rs 166.50 crores for the existing operations of the Company has not been appraised by any institution/bank and has been estimated by the Company

External

1 Expenditure and Revenue on projects in oil and gas sector will depend on assessment of the exploratory blocks awarded and award of development blocks bid for

2. Operations in the Oil & Gas Drilling, Construction and Exploration Industry have to be carried out in difficult environmental conditions and are of a hazardous nature

3 The project cost is based on present estimates of setting up similar refineries worldwide and may undergo change on account of Government policies, Exchange Rate fluctuations and variations in international prices of equipment, etc., which may result in time/cost overruns

4 Project returns are based on the Administered Pricing Mechanism (APM) administered by the Government of India (GOI). Abolition of APM or any unfavourable changes therein may affect the profitability of the oil industry and the company as well.

5 The entry of private sector in the refinery industry and the narrow demand-supply gap till 1998 and in the event of petroleum product imports being decanalised with no tariff protection, the company may be placed in a disadvantageous position vis-a-vis existing refineries

MANAGEMENT'S PERCEPTION OF RISK FACTORS

External Risk Factor #4 :

●The projections mentioned in the prospectus for the years 1998-99 onwards pertaining to the Refinery project are based on the APM of the GOI. In case the above scheme is abolished, the project is expected to remain viable as the management believes that adequate tariff protection will be available as is prevalent internationally

CREDIT RATING CRISIL has awarded "BBB+" (pronounced "triple B plus") rating to the 12.5% Secured Redeemable Optionally Convertible Debentures offered through this Prospectus. This indicates sufficient safety with regard to timely payment of interest and principal. However, changing circumstances are more likely to lead to a weakened capacity to repay interest and principal than for the Debentures in higher rated category.

What Does It Mean to be Modern?

The post-colonial predicament is that we have been mediating modernity but that mediation has always carried within itself the sense of another historicity, which introduces almost stealthily the non-self-identity of the Indian modern. What happens to some of the central concepts of our cultural and political self-understanding – such as sovereignty, citizenship, rights, democracy, secularism, the nation – when the conditions that rendered them intelligible no longer obtain? Would it be possible to map the semantic shifts wrought in them by the emergent configuration of institutions and practices? Do they retain their intelligibility today and can they still mobilise our politico-ethical horizon? If not, what new concepts are replacing them and what are their semantic field? **317**

Educated but Unemployed

Educated unemployment in Kerala has assumed alarming proportions in recent times. Among the causes are the opening of too many arts and science colleges and private ITIs and a preference for salaried (especially government) employment over self-employment. Results of a sample survey show variations in average waiting time till the first regular job by type and level of education and caste/community. **325**

Threatened Hegemony?

The gowari stampede in last November and the harassment of dalits over the 'gairan' issue in parts of Maharashtra are an indication of the growing crisis of maratha hegemony in the state. **303**

How far is the numerical preponderance of the marathas decisive to their political dominance? Why is it that it is the marathas of the Deccan who have a virtual monopoly of political power to the exclusion of the kunbis of Vidarbha? What is the class status of those who control political power? **336**

Money Market

The monetary authorities' anxieties about inflation have led to a liquidity strain in the money market with implications for the revival of industrial investment and growth. **293**

Gender and Tamil Identity

After its formation as a separate party in 1949 the DMK in Tamil Nadu used the cinema effectively to project its identity, political claims and elaboration of Tamil culture. Gender and cultural identity in a landmark Tamil film. **309**

After Marx, McCarthy

How does a marxist poet/writer in India and Asia become 'entrapped' because the Stalinist systems in central and eastern Europe have collapsed? **292**

Marine Wealth at Risk

The government's new policy of joint ventures in fisheries allows a handful of bureaucrats and politicians to trade the intergenerational heritage of our marine resources to parties who are only interested in short-run profits. **300**

More Open Doors

The two new agreements signed between India and the US recently, one a defence pact and the other a commercial alliance, are an open acknowledgement of the linkages between commercial and strategic interests. **305**

Micro View

It is necessary to qualify the assessment of the Jawahar Rozgar Yojana based on aggregative data from the concurrent evaluations with evidence from in-depth field studies. **343**

Health Research

Failure to make the vital conceptual distinction between health research and medical research reveals the major constraint on health research, and on community-oriented health research in particular. The experience of Pakistan. **307**

LETTERS TO EDITOR

Codifying Hindu Law

MADHU KISHWAR's article 'Codified Hindu Law – Myth and Reality' (August 13, 1994) gives valuable insights into the multiple frictions afflicting India of our times. In fact, the whole exercise of codification of the Hindu law has been a subversion and a violation of the time-honoured principles of governance evolved historically in pre-British India. I would illustrate with three examples, namely, Kautilya, Ashoka and Akbar, whose successful attempts to evolve principles of governance are as much a tribute to their statesmanship as to the rich diversity of the people whom they sought to rule.

Kautilya's *Arthashastra* recognises four sources of law, namely, 'dharma' (scriptures), 'vyavahara' (mutual agreement), 'charitra' (local custom) and 'rajashasana' (state decree) in ascending order of importance. He stipulates that in case of a dispute arising, each succeeding one shall prevail upon the earlier one. Thus the legal sanctity enjoyed by the scriptures is the lowest and that by the state the highest. Customary law prevails upon the scriptures but can be overruled by a state decree. The temporal power of the state is thus enabled to veto all other sanctions.

What Kautilya postulates in theory is brought into actual practice by Ashoka through his 'Dhamma', a statement of his state policy, which is clearly distinct from his personal faith. His Dhamma, evolved painstakingly over several years of his rule, and propagated nationwide through his edicts, consisted of the following salient features: (1) There is no attempt by the ruler to impose his personal faith on his subjects. (2) Likewise, the king repeatedly exhorts his subjects to respect holy men and faiths of other communities. But also, (3) the king bans such popular practices as animal sacrifice and certain congregations specific to certain communities, on grounds of their being harmful to the state's objective of maintaining communal harmony. In his Jaugada edict he even issues a veiled threat to those communities who fail to toe the royal line. In this way, while allowing and promoting internal autonomy for all communities alike, Ashoka firmly places the state above all the various churches.

More than 15 centuries later, emperor Akbar arrives at the same principles through his personal experience in governance. To recount very briefly the relevant incidents of his reign: He gave equal status to his Hindu subjects by abolishing pilgrimage taxes and 'jizya', and by throwing open state services to Hindus and the 'ibadat khana' to all communities. He read the *Khutba* which empowered him to overrule the Muslim law and to select a suitable interpretation of it. This was not only a separation of the state and the church, but also the proclamation of the sovereign power of the latter over the former. While on the one hand Akbar married many Hindu women

and practised many Hindu customs, his attempts to end such practices as sati and child marriage failed as they were seen by the Hindus as interference in their internal matters. And finally, towards the end of his reign Akbar succeeded in evolving Din-e-ilahi, the national religion based on consensus, but characteristically made no attempts to impose it on anyone.

The colonial interlude destroyed this valuable tradition of governance, the indigenously evolved principles of secularism, designed to foster communal harmony by protecting the autonomy of the communities, with the state retaining the sovereign, residual power of intervention an supersession, without identifying with any particular community. The fact that after nearly 50 years of independence India is still struggling to reinvent this simple principle, is one reflection of the deep injury caused by the British rule.

SHUBHA KHANDDEKAR

Kalyan

Journal to be Revived

MANKIND (1956-67; founder-editor Ram Manohar Lohia, executive-editor Vinayak Purohit) is being revived. Well researched and sourced contributions up to 5,000 words (exceptionally even longer) are invited from those who accept that the solution to the Indian crisis lies along the triple and confluent paths of nationalism, democratic socialism and revolutionism, whatever be the new name by which the historic revolutionary urge of the neo-colonised, limited-war torn, compradouristically exploited and globally brainwashed masses, especially of the third world, may be designated in more recent times. (Serious contributions challenging this triple perspective may also be entertained.) *Mankind* will debate all Indian political issues centring on the demands for a new

Constituent Assembly that rejects the old 1946-47 Congress-League compromise with British imperialism and for a New Economic Policy that opposes the drive towards 'liberalisation, privatisation and globalisation' as dictated by the WB, IMF and WTO. *Mankind* will also discuss the theoretical implications of the collapse from the mid-80s of Stalinist Russia and its east European empire. It will seek to analyse all the substantive issues thrown up by Trotskyism, Titoism, Maoism, Dengism, Castroism and similar ideological currents.

Mankind, a non-profit enterprise, will endeavour to pay its contributors an amount per article that will be determined eventually by the response that its readership evokes. *Mankind* will try to publish about 10 numbers per year of circa 100 pages demi-octave size, provided sufficient contributions are received that merit publication, and will be priced, subject to experience, at Rs 25 per issue (subscription for 10 issues Rs 200). *Mankind* will for the present accept contributions in English, Hindi, Marathi and Gujarati and eventually in all Indian languages.

Address for communications: Vinayak Purohit, 3, second floor, 372-A Veer Savarkar Marg, Ravi Dhuru Wadi, Dadar, Bombay-400 028.

States as Sinners

THE loss of objectivity engendered by the structural adjustment and stabilisation policies is evidently all-pervasive, affecting also institutions which are expected to be independent and objective. A case in point is the Reserve Bank of India's assessment of the state governments' finances and its general attitude to centre-state financial relations. One discerns, first, a tendency to be generous with criticism of the state governments and, second, total preoccupation with the mechanical nostrums of structural adjustment and stabilisation, altogether ignoring basic developmental issues, in particular the role of public expenditure in development.

The Reserve Bank's study of the finances of state governments for 1994-95, just published, is aghast at "the increasing revenue deficit" of the states and at the fact that the financing of these deficits "is often done by relatively high cost borrowed funds". The states' revenue deficit would account for 6.4 per cent of their total revenue expenditure in 1994-95, against 5.5 per cent in 1993-94 and an average of 6.5 per cent for the period 1987-93. As a result, there has been a surge in the gross fiscal deficit (GFD) of the states to Rs 29,321 crore or 20.1 per cent of total expenditure in 1994-95 compared to Rs 23,312 crore or 18.4 per cent in 1993-94. The large revenue deficits have been absorbing a major portion of the states' borrowings: 27.1 per cent in 1994-95 against 26 per cent in 1993-94. And with rising borrowings, debt servicing as a proportion of aggregate disbursements has been as much as 17 per cent in the past three years.

All this is true, of course. But should not the Reserve Bank have gone behind the numbers and ratios and asked whether, considering the rapid changes that have occurred in the composition of the state governments' expenditures, the deficits on revenue account could have been avoided and even whether in the given circumstances a revenue deficit of about 6.5 per cent of revenue expenditure was at all high? The centre's revenue deficit as a proportion of its revenue expenditure had crossed 20 per cent in 1992-93 and has shot up to 27.5 per cent in the budget for 1994-95. Likewise, its total debt servicing has touched Rs 1,09,632 crore in 1994-95, with interest payments eating up 53.4 per cent of all revenue receipts and repayment of debt accounting for 43.6 per cent of total capital receipts. It is certainly pertinent to ask if debt servicing at 17 per cent of aggregate disbursements is indeed unsustainable and in any case what the yardstick of unsustainability is.

It must be admitted, of course, that all is not well with the finances of state governments. The state governments can legitimately be taken to task on two grounds – first, their

inability to mobilise resources through non-tax sources such as upward revision of electricity tariffs and road transport fares; and, second, their abysmal failure to contain wastage and corruption in the use of resources so as to arrest the growth of non-developmental expenditure. The rise in non-development expenditure from 26.9 per cent of total expenditure in 1992-93 to 30.5 per cent in 1994-95 or in non-development expenditure excluding appropriation to reserves and interest payments from 15.3 per cent to 17.4 per cent has certainly eaten into resources available for development. The share of development expenditure in total expenditure has dwindled from over 70 per cent in the 1980s to 65.1 per cent in the states' budgets for 1994-95. Of course, this explosive rise has come about to a great extent because the centre has granted large increases in remuneration to its own employees and the state governments have been compelled to follow suit. Likewise, there has been a sharp rise in the state governments' cost of borrowing; the raising of the coupon rate on state government securities to 13.5 per cent in 1993-94 was decidedly questionable.

The state governments' management of their finances has otherwise been reasonable. During the whole of the 1980s, the states' revenue receipts grew at the rate of about 15 per cent per annum, which speaks well of their mobilisation of additional resources. Between 1990-91 and 1994-95 (BE), the states' own total receipts have expanded at an annual rate of 13.9 per cent per annum. The states' own tax revenue as a percentage of gross domestic product (GDP) rose from 4.9 per cent in 1980-81 to 5.7 per cent in 1990-91 and has been sustained at 5.8 per cent in 1994-95, whereas the centre's tax revenue, which had risen from 9.7 per cent in 1980-81 to 10.9 per cent in 1991-92, has fallen back to 9.5 per cent in 1994-95. The central government has indeed surrendered enormous amounts of resources in favour of the richer sections of society.

What the RBI study makes clear is that in the deterioration of the state governments' finances, a major role has been that of the sharply reduced transfers from the central government. The devolution to the states by way of their share in central taxes and grants shows a rise of only 7.1 per cent in 1994-95 compared to 13.6 per cent in 1993-94. This was due to a revenue loss of Rs 477 crore as the states' share of the resources sacrificed by the centre and a sharp slowing down of the growth of grants from 19 per cent in 1993-94 to 7 per cent in 1994-95. The reduced tempo of grants was essentially because of a fall in the rate of growth of plan grants to 8.9 per cent from 25.8 per cent in 1993-94. Loans and advances from the centre did record an increase of 21.6 per cent in 1994-95 against 16.7 per cent in 1993-94; even so, net resource

transfer from the centre has been budgeted to rise by 10.7 per cent in 1994-95 against 12.6 per cent in 1993-94. Besides, as a result of the reduction in tax concessions for small savings, provident funds, etc, the growth in the states' share of those collections has also slowed.

These facts are well known to the RBI; it is the circular reasoning of the RBI studies that is objectionable – high revenue deficit necessitating high cost borrowing which in turn leads to unsustainable levels of debt and debt servicing and reduced availability of resources for long-term investment. First, a closer look would have revealed that the structural changes in expenditure since the second half of the 1980s as proposed in the Seventh and Eighth Plans required the state governments to shift the emphasis in favour of rural development and social and economic infrastructure which have a relatively high revenue expenditure component. Capital expenditure in such areas as agriculture, energy generation and industry and minerals has suffered because the states have had to expand expenditure under revenue heads. Second, considering the overall size of the states' development expenditure – Rs 99,483 crore as budgeted for 1994-95, which is much larger than the figure for the central government at Rs 72,889 crore – a gross fiscal deficit of Rs 29,321 crore or about 3 per cent of GDP for the state governments as a whole cannot be considered as excessive when the figure for the central government was over 7 per cent of GDP. Interestingly, the gross fiscal deficit of the state governments had touched 3.5 per cent of GDP way back in 1984-85; it has remained subdued since then whereas the centre's deficit galloped to 8.5 per cent by 1990-91 as the union government used its unlimited borrowing powers through *ad hoc* and regular treasury bills as also dated government securities. The states' market borrowings, on the other hand, have been pegged to a pre-determined level. In the final analysis, the sustainability or otherwise of debt cannot be decided purely on the basis of size of debt and debt service ratios. The manner in which resources are mobilised and the purposes for which and, the manner in which expenditures are incurred have also to be considered. In these respects, it can hardly be said that the central government has been any less culpable than the state governments.

AKALI POLITICS

Unity Moves

WHETHER or not the various Akali factions ultimately become one, the moderates among them will take some time to recover from the setback they have suffered as a result of the latest unity efforts. The setback

inheres in the fact that the moderates, led by Akali Dal(B) of Prakash Singh Badal, have been forced to agree 'in principle' that they desire unity. What compounds the matter is that the pressure came from the Sikh clergy – the acting head priest of the Akal Takht, Manjit Singh. What is even more serious is that the unity is sought to be achieved in the name of the 'Sikh panth', an entity which may exist only in the minds of the clergy and the interested political and intellectual 'leaders' of the Sikhs but which has a great potential for political mischief.

The seriousness of these developments does not stop even here. Akali Dal(B), which at core remains highly sceptical of the outcome of the unity efforts and even of the very idea of unity, has asserted that the entire matter would be placed before the 'Sikh sangat' who would be the final arbiter. Although AD(B) has invoked the idea of Sikh sangat in order to underline its own independence *vis-a-vis* the clergy, and although this move is not without a democratic potential, the privileging of the idea has grave political consequences which are essentially undemocratic in their nature. For, the idea of Sikh sangat (Sikh community) is one of the core ideas of the Sikh religio-political thought, a tradition of thought in which the disjunction between the religious and the political has not yet taken place. In the idea of Sikh sangat the Sikh community is referred to as essentially a religious, as against a political, body. Thus while the privileging of the idea of Sikh sangat makes the AD(B) more democratic than the other main Akali faction, namely, the Akali Dal (Amritsar), it distances the party from the modern notion of democracy in which the growing fissure between the religious and the political is taken for granted. By thus privileging this idea, the Akali Dal(B), in other words, not only strengthens the grasp of the clergy on Sikh politics – for the clergy holds the final authority to interpret Sikh thought – it also shows itself to be a democratic novice in the modern sense.

The only way the AD(B) can wish this image of democratic *naivete*, and the only way, in fact, it can play a truly democratic role at this critical moment in Akali and Punjab politics, is by firmly rejecting the unity moves, rather than warming up to the attempts of the clergy, and taking up an independent stand regarding the direction in which the Akali politics should turn

ELECTIONS

wooing Minorities

NO one in one's senses is going to be fooled by the CBI's sudden act of generosity in dropping the charge of waging war against the nation against the Memons and other accused in the Bombay bomb blast case.

Coming fast on the heels of several other significant gestures by people in authority, the CBI's latest decision to withdraw charges and request the courts to discharge several among those hauled up earlier under TADA cannot escape the suspicion that the investigative agency is being manipulated from above by politicians for electoral requirements.

Despite repeated allegations about misuse of TADA against innocent people (including members of minority groups in certain areas) by human rights groups, the government at the centre had always been angrily dismissing the charges as false and inspired by 'anti-national' elements. All of a sudden, on the eve of the elections in Maharashtra and Gujarat (the two states where the indefinite detention of a large number of Muslims under TADA had alienated the Muslim electorate from the Congress), prime minister Narasimha Rao came out with a statement acknowledging that TADA was being misused by state governments. At around the same time, the apex court of the country by a ruling reinstated as voters several thousand Muslims of Bombay, who had earlier been disenfranchised by the authorities on the plea that they were 'foreigners'.

The same apex court, only some months back, had dismissed a special leave petition asking for a judicial directive to the government of Maharashtra to prosecute Bal Thackeray, editor of the Shiv Sena mouthpiece *Saamna*, for inflammatory writings that led to attacks on Muslims in the state following the demolition of the Babri masjid in December 1992. Why this sudden change of attitude towards the rights of the Muslim minorities?

But leaving aside the ethics of using such crude methods to win votes, the sequence of these recent developments has further eroded the credibility of institutions which are supposed to protect the citizens. The CBI in particular, having failed to apprehend those really guilty of the Bombay blasts, had been taking it out on any member of the Muslim community found to have even the slightest connection with the Memon family. In its craze to build up a case to suit the anti-Pak bellicosity of the Indian government, it went to the ridiculous extent of blaming Pakistan's ISI for hatching a conspiracy with the help of the Memons and other Muslims in India. The CBI is now being forced to eat humble pie. It has acknowledged its failure to find sufficient evidence to back the allegations to Pak involvement and has therefore been compelled to withdraw the charge of conspiracy to wage war. But who will compensate the 192 citizens who were arrested, tortured and humiliated and who languished in jails all these months – for no fault of theirs, but because of a botch-up by the country's leading investigative agency?

The apex court also cannot hope to improve its already battered image by running with the hares and hunting with the hounds. While one will surely welcome its decision to set right the wrong done to a large number of Muslim voters by restoring their voting rights – which had been taken away by the administration at the behest of the Shiv Sena mafia which literally runs the show in Bombay – one also expects it to carry out its responsibilities to the citizens by recommending punishment of the Shiv Sena and other Hindu communal outfits which continue to threaten and persecute members of minority communities.

UTTAR PRADESH

Opportunity for Mulayam Singh

IT all started seven months ago when the students of Uttarakhand, the hilly region of Uttar Pradesh, protested against the government's decision to extend 27 per cent reservation for the backwards to all educational institutions in the state. Uttarakhand has only a 2 per cent OBC population. Chief minister Mulayam Singh's directive to the vice-chancellors of Garhwal and Kumaon universities to admit OBC students from the plains to fill the quota aggravated the insecurity of the sizeable educated unemployed population of the region. The Uttarakhand Kranti Dal (UKD), spearheading the demonstrations, demanded amendment in the reservation policy in accordance with the demographic pattern of Uttarakhand. When the demand failed to evoke a response from the state government, UKD started an agitation for a separate state.

N D Tiwari who was appointed UPCC chief in August last year seized the issue to catapult himself to the forefront of national politics. Right from the beginning Tiwari never endorsed the demand for a separate state of Uttarakhand. Admittedly, it is politically unviable for the party's central leadership to concede the demand of a separate state given that such demands may proliferate across the country. But more importantly, Tiwari also did not desire to confine himself to the backwaters of state politics. Like his political predecessors, Govind Vallabh Pant and Hemvati Nandan Bahuguna, Tiwari too nurtures the ambition of making a mark in national politics as a leader from the largest state in the union. Tiwari's immediate demand, after gauging the force of the Uttarakhand agitation, was that Congress support to Mulayam Singh's government be withdrawn. When the central leadership vacillated over the decision, Tiwari forwarded his resignation within a month of his becoming the UPCC chief. After the party took a sound beating in the

assembly elections in Andhra and Karnataka, an emboldened Tiwari asked for the dismissal of Mulayam Singh's government. Meanwhile, Arjun Singh's tirade against Rao in Delhi had added to the party's woes and observers noticed an anti-Rao Tiwari-Singh axis emerging on the political horizon. In a belated move, Rao tried to salvage his position by appointing his political secretary Jitendra Prasada as UPCC chief. But not only did Prasada fail to win over the UPCC, in a few weeks he was forced to voice the same demands as Tiwari.

As against the Congress brinkmanship, it is Mulayam Singh Yadav who has played his cards shrewdly. Unrelenting in his reservation policy, Mulayam Singh made clear his readiness to forgo Uttarakhand, a region in which his party has very little stake. Like the previous BJP government, Mulayam Singh's government too passed a resolution in the assembly approving the creation of a separate state of Uttarakhand. In fact Mulayam Singh must have relished the emergence of UKD as a regional force cutting into the traditional base of the BJP and the Congress. By staging a successful bandh in September, he drew the battle-lines between the forwards and the backwards, the anti-reservationists and the pro-reservationists in the state, signalling that if the Congress pulled the carpet from underneath his feet, it would be the loser. And when eventually Congress decided to withdraw support to his government, Mulayam Singh took a hand in the mudslinging going on within the higher echelons of the Congress. By alleging Tiwari's collusion with the VHP during the 'Shilanyas' in 1989 and Arjun Singh's efforts to topple the Rao government, Mulayam Singh has sought to project an 'anti-national' brahmin-kshatriya nexus against the backwards-minority unity in the state. This tactic of Mulayam Singh is not only going to further marginalise the Congress, but will also put the BJP on its toes. The BJP has no quarrel with Mulayam Singh over Uttarakhand but the latter's ploy of projecting himself as the sole leader of the backwards in the state might erode the BJP's base in the western UP. Kalyan Singh has already started to point out how the recruitment to the police force in the state has favoured the yadavs.

The crisis which Arjun Singh and Tiwari have precipitated in the Congress has provided Mulayam Singh with an opportunity to extend his hegemony over UP politics. Even the BSP which at one time was determining Mulayam Singh's actions has had to take the backseat after its reversals in the last round of assembly polls and the threat to the survival of the SP-BSP government in the state. It is only after the results of the current assembly elections are known that the final denouement of UP

politics will take place. A defeat of the Congress, especially in Maharashtra, is certainly going to turn the tables against Rao and as a sequel may bring instability to Mulayam Singh's government in UP.

POLITICS

Cakes for the Poor

RULING elites world over have compulsively to indulge in pious talk sharply at variance with their actual practice. Even while indulging in some do-gooding exercises, they often demonstrate utter insensitivity. The police firing in New Delhi on January 30 and Jyoti Basu's conclave the next day at Taj Bengal with kind-hearted ladies (over lunch?) about problems of malnutrition in Calcutta's slums would have been eloquent instances of the ruling castes' mindless casualness, but for the dimensions of cruelty and mockery respectively.

January 30, as is well known, is the anniversary of Gandhiji's supreme sacrifice. It is observed throughout the country as the martyrs' day, which gives the dignitaries a grand occasion to wax eloquent on their commitment to serve the lowest of the lowly. On this day, just when in the misty Delhi morning the topmost of the top were assembling at Gandhiji's 'samadhi' at Rajghat for their customary rituals, a bloody policing exercise at another end of the capital took a toll of four lives. A young man of the labouring class, to follow a newspaper account, had passed the previous night as a guest at the 'jhuggi' (slum) adjacent to the middle class residential area of Ashoka Vihar. He was killed by a policeman on duty when he scaled a boundary wall to land in the community park to relieve himself. This is indeed a daily routine of the 'jhuggi'-dwellers as this huge slum of 5,000 residents has no toilet facilities. The death of the young man led to a row which was followed as a matter of course by the appearance of a posse of policemen. Then came the bursting of about 300 teargas shells and 20 rounds of firing leading to three more deaths and serious bullet injuries to another dozen.

Neither the executive nor the judiciary whose leaders miss no opportunity to pay lip-service to Gandhiji's injunctions about service to the poor spared a thought about provision of some elementary toilet facilities for the 5,000 slum dwellers, the lack of which was at the root of the events ending in the grim tragedy. The coincidental juxtaposition of the annual Rajghat rituals and the police violence at Ashoka Vihar poignantly brings out the essential hypocrisy of our ruling circles.

So also did Jyoti Basu's picture in some Calcutta dailies, flanked by two plump ladies, at the five-star Taj Bengal, pretending to be concerned about malnutrition in the slums.

CURRENT STATISTICS

EPW Research Foundation

Inflation has further accelerated, with the WPI for primary articles as also the composite food index continuing to show sharp increases. These increases are reflected in the two-digit rate of rise of the different cost of living indices. Bank credit to the commercial sector has been galloping. Equity prices have taken a beating. Industrial production has registered a rise of 8 per cent during April-October 1994, with manufacturing output rising by 8.3 per cent and capital goods by 21.7 per cent. Exports in dollar terms have risen by 16.9 per cent during April-December 1994, while non-POL imports (excluding aircraft and gold and silver) have risen by about one-fourth. Foreign assets worth \$ 560 million have been added in the past month.

Notes: (i) Superscript numeral denotes month to which figure relates, e.g. superscript ¹⁰ stands for October. (ii) Figures in brackets are percentage variations over the period specified or over the comparable period of the previous year.

Indo Gulf Industries

INDO GULF INDUSTRIES is engaged in the manufacture of industrial explosives and accessories. In order to widen its industrial and product base, the company is now diversifying and is setting up a project to manufacture white sugar crystals and allied products with a capacity of 2,500 tcd expandable to 3,500 tcd with co-generation of 6 MW of power at an estimated cost of Rs 49.68 crore at Meizapur in UP. The company has tied up with KCP, Madras, for supply of total plant and machinery. KCP is one of the premier manufacturers of plant and machinery for sugar plants and has set up more than 40 sugar plants in India and abroad. At 100 per cent capacity utilisation the company would have an annual requirement of 45 lakh quintals of sugarcane. It proposes to meet its requirement through cultivation for which an intensive programme is being undertaken. The upcoming sugar plant is expected to commence commercial production by November this year. The company is entitled to a free sale quota of 100 per cent of its production for the first nine years as applicable to new sugarcane projects located in 'Other Recovery Zones'. The entire quantity of molasses is to be sold to various distilleries for the manufacture of potable and industrial alcohol. Bagasse, the other by-product, is to be used for co-generation of power for captive consumption. Surplus bagasse is to be sold to paper mills and the industries located around the sugar mill. In order to part finance the cost of the project, the company is entering the capital market on February 14 with a public issue of 11,08,200, 12 per cent unsecured FCDs of Rs 155 each at par aggregating Rs 1,717.71 lakh. Each FCD would consist of two parts - Part A and Part B of Rs 77.50 each. While Part A will be compulsorily and automatically converted into one equity share of Rs 10 at a premium of Rs 67.50 per share on allotment, Part B of Rs 77.50 would be compulsorily and automatically converted into one equity share of Rs 10 at a premium of Rs 67.5 per share on the expiry of 12 months from the date of allotment of the FCDs.

Gujarat Optical Communication

Gujarat Optical Communication (GOCL) is promoted by Gujarat Telephone Cables (GTCL). The company is implementing a project for the manufacture of 4,000 cable kilometres per annum of optical fibre cables. The use of optical fibre cable is advantageous due to its low power requirement at terminals,

immunity to electro magnetic induction and radio frequency induction and data integrity. Optical fibre cable finds application in fields like railways, defence and power. The construction work for the unit is nearing completion at Iyava in Ahmedabad district. Commercial production is expected to commence by March. Plant and machinery along with training and performance guarantee are being provided by Swiss Cab of Switzerland. The project has been appraised by Bank of Baroda and the cost has been estimated at Rs 39.03 crore. The company is entering the capital market on February 15 with simultaneous public issues of 25.5 lakh equity shares of Rs 10 each at par aggregating Rs 255 lakh and 25,95,000, 14 per cent secured redeemable PCDs of Rs 75 each at par aggregating Rs 1946.25 lakh. The issue is being lead managed by Bank of Baroda and DSP Financial Consultants.

Ishwar Bhuvan Hotels

Promoted by Ishwarlal P Barot and Juguldas P Barot, Ishwar Bhuvan Hotels is setting up a three-star executive hotel with 55 rooms and other facilities. The proposed hotel project is located at Sayaji Ganj, Baroda. The project has been appraised by Tourism Finance Corporation of India (TFCI) which has sanctioned a term loan of Rs 200 lakh for the project. To part finance the project the company is entering the capital market with a public issue of 40 lakh equity shares of Rs 10 each at par aggregating Rs 4 crore, including firm allotment of 9 lakh equity shares of Rs 10 each at par aggregating

Rs 90 lakh to NRIs/OBCs. The issue will open on February 21. The lead managers are Shriyam Securities and Finance and Netwest Finance.

Wilwayfort India

Wilwayfort India is entering the capital market soon with a public issue of 48 lakh equity shares of Rs 10 each at par. The funds will part finance the expansion of manufacturing capacity of metallised plastic film and diversification into manufacture of multilayered co-extruded plastic films which is much in demand by the fast growing flexible packaging industry. Technology and plant are to be imported from Atlas Converting Equipment, UK. The project has been appraised by Vijaya Bank which is also financing the project through a term loan

Crystal Credit Corporation

Crystal Credit Corporation (CCCL), the flagship company of the Crystal group, is a non-banking financial institution registered with the RBI and is in the business of leasing, hire-purchase and other financial services. The company is embarking on a diversification and expansion programme. To fund this it is entering the capital market in the last week of February with a public issue of 35 lakh equity share of Rs 10 each at par aggregating Rs 350 lakh. The issue is being lead managed by All Bank Finance and World Link Finance.

LYKA LABS

Thrust on Exports

THE Bombay-based pharmaceutical company Lyka Labs has done well in 1993-94. Net sales were up by 21 per cent, operating profit by 28 per cent and net profit by 57 per cent. Margins would have been higher but for the fall in other income and non-operating profit by 30 per cent and 40 per cent, respectively. Also there was a rise in taxation, depreciation and interest charges by 16 per cent, 6 per cent and 9 per cent, respectively. While exports jumped by 164 per cent imports fell by 24 per cent. An enhanced dividend of 25 per cent was declared for the year.

Debt-equity ratio declined from 198 per cent in 1991-92 to 185 per cent in 1992-93 and 61 per cent in 1993-94. Sundry creditors to current assets has been steady at 40 per cent for the past two years. Short-term bank borrowings to inventories rose sharply by 72 percentage points. Inventories grew by 13 percentage points. Sales to total assets has declined in the past three years while sales to gross-fixed assets has increased. Earning per share increased in the past three years from Rs 1 in 1991-92 to Rs 5 in 1992-93 and Rs 6 in 1993-94. Net value added to value of production fluctuated at 15 per cent in 1991-92, 18 per cent in 1992-93 and 16 per cent in 1993-94. Remuneration to employees has shown a steady decline in the past three years from 58 per cent in 1991-92 to 46 per cent in 1992-93 and 44 per cent in 1993-94. Return to equity has been steady at 20 per cent in the past two years.

Total sales of the formulations were higher by Rs 17 crore (21 per cent). The diversified activities of the company, such as the veterinary and diagnostic and medic equipment division, also registered a growth of 35 per cent. In order to strengthen its position in the market, the company is negotiating tie-up arrangements with internationally reputed manufacturers for marketing and manufacturing its products in India. The company is setting up a wholly-owned subsidiary in Hong Kong with the objective of functioning as a trading base for the company's foray into China and other markets. The company is also setting up a unit in Tarapur, expanding its existing facilities at Ankleshwar and diversifying into the manufacture of ayurvedic medicines by investing Rs 30 crore. The expansion and diversification plans are to be phased out over the next one-and-a-half year. The first phase which started in the last quarter of 1994 is slated to be completed in March 1995.

The company invested Rs 41 lakh on its R and D activities in the year. Development of new products for the export market, development of new formulations and import substitutes were some of the activities undertaken by the department.

NATIONAL PEROXIDE

Expanding Market

Promoted by Bombay Dyeing, National Peroxide has shown a marginal increase in net sales by Rs 29 lakh (0.53 per cent), in operating profit by Rs 14 lakh (0.86 per cent) and in net profit by Rs 31 lakh (3 per cent). There was a major fall in non-operating income, while other income was up by 13 per cent. The company paid taxes to the tune of Rs 1.4 crore for the year, while depreciation and interest charges fell by 35 per cent and 14 per cent, respectively. Imports were up by 45 per cent while exports declined by 47 per cent. A 45 per cent dividend was declared for the year as against 40 per cent in the previous year.

Earning per share increased steadily from Rs 249 in 1991-92 to Rs 364 in 1992-93 and Rs 378 in 1993-94. Net value added to value of production fluctuated at 34 per cent in 1991-92, 33 per cent in 1992-93 and 35 per cent in 1993-94. Remuneration to employees increased by 4 percentage points for the year. Inventories after having fallen by 13 per cent in the previous year have now marginally risen. Sales to total assets fluctuated at 84 per cent in 1991-92, 108 per cent in 1992-93 and 67 per cent in 1993-94. Sales to gross fixed assets fluctuated at 94 per cent in 1991-92, 111 per cent in 1992-93 and 69 per cent in 1993-94. Sundry creditors to current assets rose to 42 per cent in 1993-94 from 29 per cent in 1992-93. Short-term bank borrowings to inventories ratio has been steady at 83 per cent for the past two years. Debt-equity ratio fluctuated at 107 per cent in 1991-92, 50 per cent in 1992-93 and 94 per cent in 1993-94.

Hydrogen peroxide production increased by 726 MT and sales by 752 MT. Phase I of the expansion project has been completed and commercial production from that additional stream commenced in March 1994. The plastics additives division achieved a capacity utilisation of 105 per cent, recording increased production by 1,166 MT and sales by 477 MT for the year. The company expects the demand for PVC stabilisers to improve as new PVC resin manufacturing capacities have been commissioned.

The company incurred an expenditure of Rs 67 lakh for the year for R and D. Pulp and paper industry is emerging as one of the major markets for hydrogen peroxide in the

country and R and D efforts have been continued during the year to establish usage of hydrogen peroxide in this industry. As a result, all newsprint mills have switched to the usage of hydrogen peroxide. In the area of plastics additives the company is making concentrated efforts in developing a number of new products including processing aids and calcium-zinc stabilisers for mineral water packaging with a view to diversify the market and improve capacity utilisation of the plant.

GARWARE-WALL ROPES

Diversification Plan

The Pune-based Garware-Wall Ropes is the largest manufacturer of synthetic wall ropes in the country. The company has done well in 1993-94. Net sales were up marginally by Rs 21 lakh (0.31 per cent), operating profit by 25 per cent and net profit by 66 per cent. There was a rise in other income by 89 per cent (Rs 1.55 crore) and non-operating profit rose to Rs 12 lakh for the year. Taxation and depreciation decreased by 6 per cent and 14 per cent, respectively; while interest charges increased by 8 per cent. The company declared a dividend of 30 per cent for the year. Imports were up by 56 per cent, while exports fell by 9 per cent.

Debt-equity ratio fell to 34 per cent in 1993-94 from 44 per cent in 1991-92. Short-term bank borrowings to inventories rose from 60 per cent in 1991-92 to 69 per cent in 1992-93 and 109 per cent in 1993-94. Sundry creditors to current assets showed a steady rise from 16 per cent in 1991-92 to 17 per cent in 1992-93 and 22 per cent in 1993-94. Sales to total assets declined by 69 percentage points over 148 per cent in 1992-93. Sales to gross fixed assets fluctuated at 192 per cent in 1991-92, 231 per cent in 1992-93 and 142 per cent in 1993-94. Growth in inventories has declined drastically in the past three years. Earning per share fluctuated at Rs 10 in 1991-92, Rs 14 in 1992-93 and Rs 12 in 1993-94. Net value added to value of production increased by 5 percentage points in the year as against 15 per cent in the previous year. Remuneration to employees was steady at 29 per cent for the past two years.

The company is now diversifying into the fish-net machinery manufacturing business. This project is the first of its kind in the country, since the current demand for fish-net machinery is being met by imports from Japan and Korea. This division is being set up with technical collaboration with a Japanese firm. The setting up of an in-house fish-net machinery manufacturing facility would help the company's fish-net webbing

division. The division presently operates 19 imported machines producing 1,200 tpa of fish nets. Garware would be cutting down on its cost by manufacturing the machinery, for import duty on finished goods is quite high. The division does not plan to sell its machinery in the domestic market but plans to export it at a later stage. Having a strong presence in the international market with 40 per cent of its total production of twines and ropes being exported to more than 35 countries in Europe, West Asia, USA, and south-east Asia, the company has recently entered into a joint venture with the Indonesian 'Penta Group' to manufacture 1,200 tpa of synthetic ropes. Since the unit is being set up in Indonesia, the company would be saving 10 per cent import duty, thus enabling it to price its product competitively in the market. Garware-Wall Ropes has commenced its spadework to become the largest cordage manufacturer in the world. The company has also entered into an agreement with a party in Jabel Ali, Dubai, for providing technological and marketing support for manufacture of 600 MT of synthetic ropes thereat, including supply of entire set of plant and machinery as also continued supply of requisite quality of yarn from India.

The company invested Rs 25 lakh on its R and D activities in the year. Developmental activities of speciality fishing nets and sports nets, and length stretching and depth stretching machines and special air intermingled sewing thread were undertaken.

PADMATEX ENGINEERING

Tariff Policy Problems

Padmatex Engineering, manufacturers of textile machinery, suffered a setback in 1993-94. The company has been showing continuous fall in profitability for the past three years. However, this year the company has suffered losses. Net sales were down by 11 per cent (Rs 6.77 crore), operating profit by 108 per cent (Rs 7.82 crore), and net profit by 416 per cent (Rs 7 crore). While other income was down by 33 per cent (Rs 1.35 crore), non-operating profit was up by 83 per cent (Rs 77 lakh). Depreciation rose by 28 per cent while there was a marginal fall in interest charges. Exports and imports fell by 99 per cent and 34 per cent, respectively.

Last year the debt-equity ratio had suffered due to a more than proportionate increase in long-term debt, but this year it has again got steadied. Sundry creditors to current assets ratio declined steadily from 42 per cent in 1991-92 to 38 per cent in 1992-93 and 28 per cent in 1993-94. Sales to gross fixed assets fell by 36 percentage points. Earning per share fell sharply. Net value added to value of production fluctuated at 13 per cent in 1991-92, 19 per cent in 1992-93 and 11 per cent in 1993-94.

High tariffs on indigenous capital goods industry has been one of the major reasons for the company's automatic cone winders (ACWs) becoming completely uncompetitive in relation to fully imported machines. Since the duty on imported components is 40-65 per cent and because the newly introduced ACW-Autoconier-238 has a high import content, the company has to bear a high duty burden. To escape this, efforts are being made to indigenise components as rapidly as possible.

The company has invested Rs 19 lakh on R and D activities in the year. Production of ACW Machine-238 model, manufacture and introduction of blow film line, indigenisation of ACW-238 model with individual spindle slicing were some of the activities carried out by the department.

DGP WINDSOR

Hit by Recession

Formerly Klockner Windsor, the now Thane-based DGP Windsor is a 30-year old company and has been a pioneer in manufacturing and selling plastic processing machinery and a leader in injection moulding machinery. The company has not done well in 1993-94. Though net sales went up by 2 per cent, operating profit and net profit declined by 18 per cent and 105 per cent. The decline in other income by 58 per cent and non-operating profit by 71 per cent was balanced by a 65 per cent decline in taxation and 20 per cent decline in interest charges. Exports and imports declined by 35 per cent and 30 per cent, respectively. The company declared a 10 per cent dividend for the year.

Debt-equity ratio rose by 10 percentage points in 1992-93 and fell by 14 percentage points in 1993-94. Short-term bank borrowings to inventories increased by 17 percentage points. Sundry creditors to current assets has been steady at 32 per cent for the past two years. While sales to total assets has

fluctuated in the past three years, sales to gross fixed assets has declined steadily. Net value added to value of production declined from 19 per cent in 1991-92 to 18 per cent in 1992-93 and 15 per cent in 1993-94. Remuneration to employees increased from 34 per cent in 1991-92 to 48 per cent in 1992-93 and 58 per cent in 1993-94. Earning per share has been falling in the past three years. Current dividend to total paid up capital has been maintained at 9 per cent in the past two years. Even with falling profitability the company has maintained its dividend at a minimum of 10 per cent. Return on investment declined by 9 percentage points in a span of three years from 12 per cent in 1991-92 to 3 per cent in 1993-94.

Recessionary conditions in the machine-user industry was one of the major reasons for the depressed performance. The company's machines find application in telecommunications, automobiles, plastics, electronics and consumer durables. With abundant availability of raw materials, good export potential for plastic components and an overall growth in plastics industry the company expects to perform better. It is planning to double the production capacity of its injection moulding machinery and extrusion machinery. From the original capacity of 1,000 units for the injection moulding machinery the company plans to double it in three years. As for the production of extrusion machinery it plans to increase capacity to 600 units from the present 250-300 units.

The company invested Rs 92 lakh (increase of 87 per cent) on R and D. The division is recognised by the department of scientific and industrial research, government of India. The department has contributed to developing a number of new products. Also there were significant developments in microprocessor controls for machines. The department also designed and developed a new range of 'Winmicro' injection moulding machinery and some of the models were exhibited in Plastindia 94.

Sociology of G.S. GHURYE

S.K. Pramanick

This book is the first comprehensive attempt to analyze three major areas of Ghurye's contributions to Indian sociology. First, his own substantive writings, his theoretical postulates and his vision of the role of sociology in India. Second, his role in promoting and directing the course of research in diverse fields of Indian society. And third, his role as an institution-builder in the establishment of the Indian Sociological Society and in introducing the Sociological Bulletin, which continue to be the platforms for professional sociologists in India even today.

Marx Is Dead, Long Live McCarthy

GPD

How does a marxist poet/writer in India and Asia become 'entrapped' because the Stalinist systems collapsed in eastern and central Europe?

IT was in the last week of last year that the annual literary meet of people writing and interested in Marathi took place in Parabhani in the Marathwada region of Maharashtra. A distinguished poet and a life-long communist, Narayan Surve, presided over the proceedings. I do not know if a member of a communist party or even a known marxist had ever presided over these annual sammelans (meetings). These meetings are important basically as a celebration of literature, a celebration which does mix the popular with high-brow to a small extent. Forty thousand people listened to the presidential address at the inaugural function. In our world where the visual and electronic media seem to have overshadowed the written word, that a poet and one writing in a small-time language like Marathi, is so celebrated is great news indeed. For the various seminars and symposia organised at the Parabhani too there was no dearth of audiences. Five to ten thousands listened to these not always very illuminating or entertaining discussions with rapt attention. Some tribute to the tolerance of the Marathas, one must say. But that is not the reason why we have chosen to write on the occasion. It is some representatives of the smug Bombay elite who find all the 'jnanvridhas' (senior learned people) usually in England and America who made us aware that at least for some the Parabhani meeting was more than a celebration of literature. It was a celebration of a marxist, something they could not take.

Now, you would think that we live in a post-socialist and, more importantly, a post-marxist world. It would not now matter what kind of a marxist you are or were. We had thought that the only people worried about that in our country were the communists of different 'varnas' themselves. Obviously, that does not seem to be the case. It is the non-communists who seem to be worried about marxists and, if correspondence in this very journal is to be taken seriously, about 'Stalinists', real or imaginary, too!

Be that as it may, Narayan Surve's election to the chairmanship of the 'utsav' (celebration) of literature seems to have worried at least some of the scribes writing in Marathi newspapers. One editorial called him "an entrapped poet". One would have thought

all good poets are essentially entrapped souls, marxism or the lack of it notwithstanding. It is not for no reason that 'shoka' (sorrow, bereavement, unhappiness) and 'shloka' (verse), the two ancient terms, are phonetically so close. How does a marxist poet/writer in India and Asia become entrapped because the Stalinist systems collapsed in eastern and central Europe? Do we take these editors and scribes as entrapped souls because liberal democracy has failed in most of the coloured world? To be sure, we do not have to because their assessments of democracy or capitalism are essentially Europe-based. Consult a Marathi editor and in all probability he will tell you how the marxian critique has proved false and misleading. What he will not tell you is that his assessment is based on his understanding of Europe and North America. What happens in the rest of the world and what Euro-American prosperity has got to do with domination over and continuous impoverishment of the coloured world rarely ever dawn on him. The fact of the matter is that it is not poets like Surve who are entrapped but rather these scribes — in Euro-American glitter and glamour. Unwittingly they have devised a way to get out of their entrapment. For them, people who think that critique of capitalism is not dated, not yet anyway, are the entrapped souls. Pity them and throw them in the dustbin of (capitalist) history is their policy. Their concern for 'entrapped poets' springs from this. When a writer with known and established 'feudal' and 'Hindu nationalist' credentials is elected to preside over the annual festival of Marathi letters, no editorials are forthcoming on the 'entrapped' people who elect them. We are not suggesting that they should be. What we are suggesting is that McCarthyism should not pass off as concern for the literary health of somebody like Surve.

As if pontification on the setting of the socialist sun and marxist authors was not enough, another scribe came up with what can only be described as a witch-hunt. This scribe, whose main claim to literary fame springs from his translation activity decided to refer to the emergency imposed by Indira Gandhi 20 years ago. A section of communists, to which Surve belonged, had supported the emergency at that time. This scribe

makes a reference to a Sahitya Sammelan which had taken place in Karad in the presence of Y B Chavan at that time. Durga Bhagwat, the then president, had chosen to take up cudgels against the emergency and had confronted Chavan on the question. There is little doubt that the grand old lady of Marathi letters had taken a courageous position then. But the scribe does not only say that. He asks an almost tearful question. Oh, lovers of Marathi letters, he seems to ask, think what the world has come to! Somebody who had supported the emergency 20 years ago is now going to occupy the same chair which was once occupied by Durga Bhagwat. This is simple Stalinism in reverse. Or perhaps worse. It is actually McCarthyism. For these people the fact that Surve is a fine poet is not as important as the fact that he is a known and self-confessed communist. No European takes such simplistic and anti-democratic positions. It is in Russia, and not in western Europe, that Mayakovsky is under attack and it is in Bombay that Surve has to suffer condemnation because he declares himself to be a communist and his party (not just he as an individual, a distinction that our scribe would probably not even understand) had taken a patently wrong political position on the emergency.

In other words in the post-socialist world any reason is good enough to declare the marxists out of bounds for the civilised world. We have not used the names of the scribes concerned for two reasons. One, we have no personal quarrel with these scribes, in fact we have some respect for their reading and prose style. Two, for non-Marathi readers the names would not make much sense anyway. It is the McCarthy-like element in their criticisms which does worry us. One had not thought that the democratic instinct of these people was basically so weak and that authoritarian views would masquerade as liberal views. But that's the price one has to pay, one reckons, if one takes the view that Marx is still relevant in an atmosphere in which the battle-cry of Maharashtra liberals seems to be: Marx Is Dead, Long Live McCarthy!

Inflation Anxieties Cause Liquidity Strain

The monetary authorities' anxiety about inflation has led to the current liquidity strain in the money market.

(1) GROWING LIQUIDITY STRAIN

JANUARY began with the legacy of an unusually tight liquidity regime that dominated the whole of December as a result of several seasonal and non-seasonal factors, such as arresting of the foreign currency accruals and reduced bank deposit growth on the supply side and, on the demand side, advance tax payments, PSU disinvestments, subscription to the UTI's rights offer for US-'64 scheme, and a dramatic spurt in the demand for bank credit to the commercial sector. The legacy persisted throughout January. Again, on the supply side, though the official foreign reserves (other than gold) experienced a small recovery with the RBI re-entering the market for surplus dollar purchases after it withdrew for a quarter or so, the commercial bank deposits have generally stagnated for the second month in succession. Foreign currency assets (including SDRs) increased by only Rs 926 crore in four weeks between December 30, 1994 and January 27, 1995. But the aggregate deposits of scheduled commercial banks, which rose by Rs 1,632 crore during the last week of December, fell by an almost equivalent amount in the week ending January 6 and recovered again by a similar amount in the fortnight ending January 20, thus exhibiting over the four-week period virtual stagnation. The short-term investible funds available with the public sector financial institutions, which are parked as 'other deposits' with the RBI and which touched a peak of Rs 3,584 crore on December 23, have remained since then about Rs 1,000 crore below that level up to January 13. On the other hand, demand for bank credit became further buoyant with non-food advances of scheduled commercial banks showing an increase of Rs 3,225 crore between December 30 and January 20. Added to it, from the fortnight beginning January 21, RBI stepped up the cash reserve ratio (CRR) on foreign currency (non-resident) accounts (banks) [FCNR (B)] scheme from 7.5 per cent to 15 per cent and introduced a CRR of 7.5 per cent for the first time on non-resident non-repatriable rupees (NRNR) scheme, which together are expected to impound as much as Rs 1,155 crore of banks' resources. With the termination of exchange cover for the foreign currency non-resident accounts (FCNRA) scheme, a large reduction in deposits under the scheme was accompanied by a corresponding growth in deposits under the above non-resident schemes which hitherto enjoyed zero or concessive CRR. The root cause of the current liquidity strain in

the money market is the RBI's tightfistedness as a result of the authorities' anxiety regarding the persistence of high inflation which, with a 11.1 per cent rise in WPI over the past 12-month period, now stands nearly at double the rate of 6 per cent visualised as a year-end goal despite a bumper agricultural crop.

(2) CALL MONEY RATES

The phenomenon of unusually high and volatile interest rates in the overnight market that dominated virtually the whole of December persisted, in fact to a greater extent, in January. Apart from the strain on liquidity, apprehensions of banks about their ability to meet the requirement of maintaining 85 per cent of their CRR liability on a daily basis from the fortnight beginning January 7 also loomed large on the money market scenario. The reporting fortnight ending on January 6 covered also the last week of December that faced severe month-end/year-end liquidity crunch. As the tight liquidity position lingered on, the call rates in the first week of January remained high and also volatile. The first two working days of the New Year saw the rates ruling in the range of 18-14 per cent, but on January 4 the market opened with a clamour for borrowings even at 35 per cent and hence the RBI reportedly injected Rs 1,900 crore for the second time in the recent period (about Rs 2,000 crore having been provided in December), through the STCI under repurchase/refinance arrangements against government securities and through the DHFI under similar arrangements essentially against treasury bills: these institutions in turn are said to have provided funds at 15-20 per cent to banks under ready-forward deals, the call rates did ease after this injection. But on the next day, January 5, which was the penultimate day of the reporting fortnight, the overnight rates again went berserk and ranged from 25 to 60 per cent as some of the foreign banks became desperate to cover for CRR on this day rather than on the reporting Friday, particularly before moving on to the new system of CRR coverage (Graph A). This is because inter-bank borrowings on the reporting Friday

raise the base-level net demand and time liabilities (net DTL) for the CRR/SLR coverage in the following fortnight. Dealings on reporting Friday (January 6) also opened with call rates being quoted at a high of 25 to 30 per cent for a few borrowers amongst nationalised and foreign banks who had failed to cover their CRR positions on the penultimate day as they could not borrow under the commercial bills rediscounting avenue – another preferred method of borrowing so as to avoid a rise in the base-level net DTL. While market reports suggested the day's closing quotation for overnight money at 6 per cent, the DFHI reported the closing rate to have dipped to 1 per cent on January 6.

The second fortnight beginning January 7 saw the call money rate remaining stubbornly high generally in the range of 11 to 18 per cent but at the same time less volatile; it was so even in the last week of the month. This generally represented the anxiety on the part of the banks to adhere to the new system of CRR maintenance which tended to firm up the rate in the range of 15-18 per cent in the first week of this second fortnight. The following week saw some easing of the rates to a range of 10 per cent to 13.5 per cent except on the reporting Friday (January 20) when they dipped to a low of 5 per cent. Apart from the new CRR maintenance system, the upward revision in the reserve ratio on certain non-resident deposits effective from January 21, combined with the general shortage of liquidity, made the rates rule high in the range of 10.5 per cent to 17 per cent in the last 10 days of the month.

That the call rates were unusually high during January 1995 are evident from the fact that the average of top-end rates at 17.7 per cent was the highest in recent months (Table 1). Though the coefficient of variation measuring the extent of volatility was lower in January than in December, it hid the fact that intra-day fluctuations were more in January (Table 2).

The general upheaval in the money market during January 1995 activated different institutions and instruments to assuage, to hedge and to profiteer. The injection of liquidity by the RBI repo facilities provided to banks through the STCI/DHFI have been noted earlier. Yet another development in the market related to the operations of the UTI. The authorities' expectations were that the funds mopped up by the UTI through subscriptions to its rights issues on its US-'64 scheme would revert to the money market and thus help subside the call rates but the

TABLE 1. DAILY TOP-END QUOTATIONS IN CALL MONEY RATES (PER CENT)

DECEMBER 1994 AND JANUARY 1995

UTI apparently changed its strategy; it did not lend in the call market, which pushed up the overnight rates and thus forced the banks to sell gilts at attractive prices which were then purchased by the UTI itself. Finally, the general liquidity crunch and the persistence of high call money rates made the banks desperate to mobilise deposits. As the Indian Banks' Association (IBA) allowed banks to offer interest rates on short-term deposits as they deemed fit, many banks went ahead offering the maximum permitted rate of 10 per cent on deposits of 46 days to one year. While the RBI had freed interest rates on bank deposits with only the ceiling of 10 per cent prescribed in April 1993, the IBA had prescribed a progressive scale then. So fierce has been the competition that some of the banks, contrary to the RBI regulations, even discriminated between depositors and offered higher rates to large depositors. The RBI had to step in and caution the banks that if caught discriminating between customers based on deposit size or the value of a customer, they would invite penalty. These RBI instructions have always existed since 1985.

(3) IMPACT ON FOREIGN EXCHANGE MARKET

During the month of January 1995, the foreign exchange market experienced wild swings in cash-spot differentials and forward premia for all maturities. The general illiquidity of money market instruments and

high degree of volatility and uncertainty in call rates had pushed up the six-month forward premia (annualised) from an average level of 4.01 per cent in the last week of December 1994 to 4.27 per cent on January 3, 4.65 per cent on January 4 and 4.78 per cent on January 5. It is interesting to observe that the demand for forward dollar had emanated not from importers but from the banks and exporters who sold dollar cash/spot and bought forward thereby providing an upward push to the forward premia; the rupee proceeds so obtained were invested in the call money market to reap arbitrage benefits of high call rates.

While some banks were engaged in forward bookings, other banks and some ex-

porters sold dollar for instant cash so as to invest the proceeds in the call money market where the rates touched the high level of 35 per cent on January 4, and purchased dollar spot the transaction of which is completed in the next two working days. As a result, the cash price of dollar declined and the counterpart purchase of spot dollars pushed up its price, thereby widening the cash/spot percentage differential to a whopping 29 per cent (or five paise as against the average one paise) on January 4 (Graph B). The speculative returns these players are said to have reaped ranged from 30 per cent to 45 per cent. The difference between cash and spot dollar further widened to seven paise on January 5.

The six-month annualised forward premia eased subsequently to 4.56 per cent on January 6 and to 4.53 per cent on January 9. However, it again flared up to 5.43 per cent on January 11 which is said to have been due to heavy overnight forward covering by SBI which covered heavily cash over spot and forward. The six-month rupee-dollar swap rate again scaled a new height of 6.06 per cent on January 12 with a premium of near-one rupee for the US dollar (Graph C). The cash/spot percentage differential (annualised) had widened to 17.5 per cent on this day. Besides the wild volatility in call rates, the other responsible factors were FCNR covering by all foreign banks and SBI covering for some corporate clients. The forward premia rates, however, started softening somewhat from January 13 onwards to reach 4.99 per cent on January 16, there was a brief skirmish during the next three days when the forward premia moved up to 5.61 per cent following a rumour of rupee devaluation. The annualised premia in the cash/spot market remained in a narrow range of 3 per cent to 4 per cent. After a brief spell of easiness, the cash/spot differential and the forward premia got widened, with the former touching near 27

GRAPH D: CUT-OFF YIELDS OF 91-DAY AND 364-DAY TREASURY BILLS (PRIMARY AUCTIONS) APRIL 1993 TO JANUARY 27, 1995

GRAPH E: YIELD CURVES FOR 364-DAY TREASURY BILLS AND GOI SECURITIES - WEIGHTED AVERAGE FOR JANUARY 1995

per cent on January 26 and the latter jumping to 6.53 per cent on January 27. As against the end-December forward premia price of 70 paise, the forward premia on January 27 stood at over Rs 1.02, at which level the exchange rate worked out to be Rs 32.41 as against the end-December rate of Rs 32.07 – a depreciation of 34 paise of 6 per cent in a matter of three weeks. (On January 27, the RBI reference rate for the US dollar, which is based on noon rates for a few select banks in Bombay, increased to Rs 31.40 from the generally sticky rate of Rs 31.37, showing a mild depreciation of the rupee.) More importantly, the spread between the bid and ask price of forward covers widened to a high of 5.5 paise as against the normal differential

of 2 paise indicating the shifting of heavy cost to forward buyers. This also indicates that dollar was being sold cash/spot to gain the advantage of a weak rupee which went down to Rs 31.41 per US dollar and bought forward resulting in an upward pressure on forward premia.

The general trend in the forward premia in the recent period seems to be on an ascending trajectory, reflecting market perception of a possible depreciation of the rupee in the near future. First, the trade deficit is expected to widen as the annual rate of increase in non-POL imports has galloped to over 32 per cent. Further, oil prices are expected to increase as the prices have bottomed out now in the international market.

The process will also be aided by the reduced inflow of dollars due to poor FIIs' portfolio investment and limited GDR inflows.

(4) PRIMARY MARKET AUCTIONS OF GILTS

While the market response to the government's short-term debt floatations has been steadily declining in recent months, there was seen a silver-lining in that at the fag end of January/early February, there was adequate response to a five-year zero coupon bond probably based on yield considerations, lower cash outgo for the present and bulk cash flow inclusive of principal and interest at maturity, no tax deductions at source and the market expectation that interest rates in the medium-term would be lower.

GRAPH F: YIELD CURVES FOR 364-DAY TREASURY BILLS AND DATED SECURITIES - WEIGHTED AVERAGE FOR THE LAST WEEK ENDED JANUARY 27, 1995

GRAPH G: YIELD CURVES FOR DATED GOI SECURITIES AND STATE GOVT SECURITIES - WEIGHTED AVERAGE FOR JANUARY 1995

Repurchase Auctions (Repos)

The Reserve Bank's repo auctions, done twice a month, continued to receive poor response with only one bid received in each of the month's auctions, which too was rejected in both the auctions, as in December 1994 (Table 3).

91-Day Treasury Bills

The tight liquidity position reflected in this weekly auction also. While a good number of bids were received, in terms of amounts, they were too little compared to the notified amounts. The Reserve Bank had to give progressively higher cut-off yield from 10.51 per cent at the beginning of January to 11.10 per cent towards the end of the month (Table 4). The Reserve Bank has further curtailed the size of notified amount from Rs 100 crore in the first two auctions to Rs 50 crore in the subsequent two auctions of January (so also in the first two auctions of February).

364-Day Treasury Bills

Unlike the above two, these auctions received a relatively better response. Interestingly, investors bid small amounts in a large number of bids. They also expected a higher yield which the government obviously would not have liked to concede. As a result, though the Reserve Bank accepted a majority of the bids and paid a yield higher than the preceding auction each time, in terms of amounts it rejected more than it accepted. The yields in the month's two auctions were 10.56 per cent and 10.86 per cent, respectively, which significantly have turned out to be much lower than those offered on 91-day treasury bills.

Dated Securities

On January 30 the government announced a borrowing programme through zero cou-

pon bonds. Bonds worth Rs 2,000 crore with a maturity of five years were to be auctioned on February 2. Given the unduly poor response of the market last December (2.77 per cent of the outstanding bills were converted) towards the conversion of 364-day treasury bills into a 3-year security at a coupon rate of 11 per cent, the central bank has preferred the zero coupon bond route which has the advantage of keeping the cut-off price/yield open. Besides, the RBI has also added an additional attraction of conferring purchase facility to these bonds straight away.

The market which had just taken a breather from the seething rates in the overnight market naturally expected a higher yield on the bonds. The cut-off price and the implicit yield accepted by the authorities on the first zero coupon bonds of similar maturity issued in January 1994 were Rs 53.90 and 12.7508 per cent, respectively. The expectations were based on the fact that the liquidity crunch had pushed interest rates across-the-board to a higher level. With most banks offering 10 per cent to short-term deposits of 46 days to one year, the cost of resources for them had increased; in fact there have been hints held out by banks that they would have to resort to a hike in the lending rates so as to maintain their already reduced spreads. On the other hand, major concerns on the part of the government and Reserve Bank were two-fold: a desire to bring down interest rates on commercial lendings so as to aid the process of economic recovery and to contain the government's growing debt and debt service ratio. If the government gave a higher yield this time, the investment portfolio of banks would also tend to depreciate.

The results confirmed the central bank's perception that interest rates in the medium term are likely to decline. Bids worth over Rs 2,300 crore were received and the Reserve Bank accepted the bids at a cut-off

price at Rs 54 and above with partial allotment to two bidders. At this price, the YTM worked out to 12.71 per cent which compared well with the YTM of 12.75 per cent for the zero coupon bonds floated in January 1994. (However, total bids received at that time amounted to Rs 6,995 crore against a notified amount of Rs 3,000 crore.) The rate was noticeably higher than the existing yield to maturity observed in the secondary market for gilts of similar maturity.

(5) OPEN MARKET OPERATIONS

The Reserve Bank resumed its open market operations once again on January 28. This time it offered 6.25 per cent security maturing in 1996 at a sale price of Rs 92.38. The same security was put on sale in December last at a price of Rs 92.31 which meant a YTM of 10.15 per cent. By lowering the yield further to 10.10 per cent the Reserve Bank continued to remain passive in its open market operations. At a yield of 10.10 per cent, this offer did not match the market trading rates of securities with similar maturity. For instance, on January 25, 12.75 per cent 1996 security was trading at an YTM of 12.1249 per cent or on January 21, at an YTM of 12.0329 per cent. Therefore, like last time, there were no takers for this paper in the market. Apart from the insufficiency of yield to maturity, there was also the question of a poor coupon rate of 6.25 per cent which has implications for the current income and the ensuing year's profit and loss accounts of banks.

Incidentally, the Reserve Bank had also offered on January 28 to buy 12 per cent 1999 security and 12.35 per cent 2004 security at par from the market. The offer being only as a matter of safety net no investor found it necessary to sell the security at par to the central bank. The market was trading the 12 per cent 1999 security at Rs 100.05

on January 30. The Reserve Bank withdrew the above purchase/sale offers on February 3 and instead placed the brand new zero coupon bond for purchase at par (i.e., Rs 54) and the 12 per cent 1999 security for sale at Rs 98.33.

(6) NEW ISSUES OF PSU BONDS AND OTHER INSTRUMENTS

Along with the government's debt market, the public sector bonds market, the corporate debt market and the certificates of deposit (CD) market also showed signs of growing. This was a direct consequence of the downturn in the capital market, the testimony of which was given by the withdrawal of the mega IDBI issue scheduled for January 27. Private placement of PSU bonds, as also issuance of CD, in favour of financial institutions, became a dominant feature in January as the primary as well as the secondary equity market failed to provide the investment outlet for the surplus funds of the FIs.

PSU Bonds

Many PSUs began to look at bonds as an alternate route for raising money. The interesting aspects of this trend was that most bonds were privately placed with primary investors, viz. banks and financial institutions and the structure of the debt instrument which reflected a wide variety. Notable among the bonds issues was Rajasthan State Industrial Development and Investment Corporation which issued structured obligation bonds worth Rs.250 crore. The privately-placed bonds of IFCI were worth Rs 200 crore. The IFCI bonds had two schemes – vanilla note and liquid note. The vanilla note was a straight offering with 12.75 per cent coupon rate payable half yearly. It also has a call option to be exercised by IFCI at the end of three years at a premium of 1.25 per cent. The liquid note allows the investor to redeem the paper through put option at the end of each year four times during the bond tenure of five years. The note has graded coupon which, beginning with 11.75 per

cent in the first year, increases every year to reach 13.75 per cent in the fifth year. The IFCI has the right to call the note at the end of three years at a premium of 1.25 per cent.

Corporate Bonds

The instruments of floating rate bonds, however, took a beating as corporates postponed issues of bonds due to volatility in the overnight market. At least three corporates – Ashok Leyland, Infrastructure Finance and Leasing (IL and FS) and Bharat Forge – were known to have postponed their FRNs. A market for SCICI's FRN also could not be created for the same reason.

CD

In their search for deposit resources, some banks resorted to the issuance of CD even though the yields offered have had to be pushed to as high as 13 per cent with their effective costs touching even 14 to 14.5 per cent. This was in sharp contrast to the yields of 9-9.5 per cent quoted a couple of months ago. The CDs in the recent period have been issued by banks in favour of financial institutions such as IDBI, ICICI and IFCI, though such issues subsided towards the end of January.

(7) SECONDARY MARKET

The trend of distress selling of gilt-edged paper and increased use of ready forwards in treasury bills and permitted dated securities which had begun in December contin-

ued in January. The weekly data on the NSE operations, as presented in Table 6, testify to the fact that sell orders generally outstripped buy orders on that exchange. The system of ready forwards received an impetus from the RBI's injection of liquidity through the DFHI and STCI, as explained above. The aggregate amount of ready-forwards during January was Rs 6,005 crore as per the RBI's SQL data (Appendix Table) as against a range of Rs 1,200 crore to Rs 2,356 crore during each of the previous four months. Investors resorted to disinvesting in state government loans too in order to access additional resources. The acute pressure faced by funds managers tended to distort the behaviour of the yield curve for government of India treasury bills and dated securities with sharp upward movement at the short-end and downward trend at the long-end. The pressure was also reflected in the stiffening of the forward premia for the US dollar in the domestic inter-bank market in all its maturity transactions.

Apart from the activation of the market for CD and CP, the public sector bonds market and the corporate debt market also showed signs of added activity essentially as a direct consequence of the downturn in both the primary and secondary markets for corporate equities. Many corporates began to look at bonds as an alternative route for raising money and the investing institutions found them as alternative outlets for deploying their surplus funds.

@ Outstanding amounts are estimated for all weeks of January 1995

Government Securities

The distress nature of transactions in gilt-edged securities is evident from the steady declines in their prices which in effect had begun in December. The price of frequently traded 12.75 per cent 1996 security which was Rs 103 in early Decem-

ber, fell to Rs 102.35 towards the end of December; on January 31, it was traded at Rs 100.65. Similarly, the 12 per cent 1999 which the RBI also purchased under its open market operations in early December at Rs 103.34 was traded in mid-January at Rs 101.45; its price finally fell to as low a figure as near par at Rs 100.05 on Jan-

uary 30. As a result of the banks' anxiety to avoid booking huge depreciation in their older gilt-edged holdings, much of the secondary trading has taken place in new securities like, besides the above, 12 per cent 1995, 11.64 per cent 2000, 12.75 per cent 1996 and 11.75 per cent 2001. As said earlier, repos dominated the treasury bills

(-) No trading

and central government security transactions during the month

A phenomenon which was noticed in December but acquired some prominence in January relates to the active trading, though in dribbles, in state government loans. In the month of November 1994, 10 state loans were traded for allotted amount of Rs 10 crore and in December, 16 loans were traded for Rs 12.6 crore, but in January as many as 35 state loans were traded for an amount of Rs 88.6 crore. Significantly, while the yield curve generally indicated a smooth pattern, there was however distinct discrimination as between states based on the market's risk perceptions.

Distorted Yield Pattern

The excess holding of SLR securities by banks in the recent past followed by a sudden emergence of liquidity strain has caused various distortions in the nature of trading in gilt-edged securities and the resultant behaviour of the yield curve. First, the cut-off yields in the primary market have not only risen but the rise has been sharper for 91-day treasury bills than for 364-day bills (Graph D). Second, in the secondary market, the yield curve for the 364-day treasury bills has experienced a distinct and perceptible downward slope (Graph E) contrary to the behaviour in earlier months and contrary to its behaviour in a normal situation. In practice, with pressure for cash the holders of 364-day treasury bills appear to have dislodged those bills which are close to the redemption date at depressed prices. Third, a somewhat contrary situation obtained in the case of long-dated securities where only the longest maturity period securities ob-

tained relatively low prices and the highest yield. Even so the yields to maturity for 364-day treasury bills have remained far above those for the dated securities (Graph F). This is very similar to a situation described by Nicholas Kaldor in an essay in 1960. Arguing that when the short rate of interest is either abnormally high or abnormally low, the yield curve will be distorted, Kaldor said "at times when the short rate is very high, it is even possible for the yield on long-term and irredeemable bonds to stand lower than the current short rate of interest" (Nicholas Kaldor, 'Keynes's Theory of the Own-Rates of Interest' in *Collected Economic Essays*, Vol II, *Essays on Economic Stability and Growth* Duckworth, 1960). Kaldor further opined that the above must reflect the expectation that the short rate will fall in the future.

Finally, the yield curve on state government securities, where the number of transactions during the month was very large, has behaved in a normal fashion, of yields rising with lengthening maturity dates up to a certain high level (Graph G).

PSU Bonds

There has been a growing mismatch between buy and sell orders in the PSU bonds market with sale offers far outstripping the buy offers (Table 6). Because of the prevalence of high prices, the actual deals turned out to be meagre. Only a few selected PSU bonds were traded in the market. These were NTPC, HUDCO, IRFC, RECL, DVC, NLC, MTNL, IDBI and PFC. The yields on these papers truly reflected the risk borne by the investors in holding them. This was a positive sign for the fledgling bonds market.

Commercial Paper

Activity in the commercial paper market also gained momentum with the availability of a reliable trading floor in the form of NSE screen since December 1994. CPs issued by Alpic Finance, BPL, ITC Bhadrachalam, Jain Irrigation, Dabur and ICI changed hand at yields in the range of 14 to 18 per cent, though the amounts traded were generally small. Quite surprisingly though at one point of time the rate offered by CP and that on government's treasury bills converged, but it was a momentary and shortlived occurrence.

Certificates of Deposit

There were only a few deals worth Rs 42 crore in the secondary market for certificates of deposits during the first week of January (Table 6).

NSE and SGL Operations

The significant divergence between order value and traded value on the NSE was indicative of the fact that investors used the NSE for testing the market more than for trading. Besides, there has been a substantial difference between the transactions done on the NSE and those recorded by the Reserve Bank's SGL. All the securities which can be traded through the SGL recorded a much higher volume there and only nominal amounts at the NSE floors (see Appendix Table compared with Table 6).

Inter-Corporate Deposits

Inter-corporate deposits appear to have remained stable during the month. Though estimates of the volumes were not available, the going rates were between 12 per cent for 90 days and 16 per cent for one year.

Impact of Joint Ventures on Fish Economy

John Kurien

To permit the government's new policy on joint ventures in fisheries to proceed tantamounts to allowing a handful of bureaucrats and politicians to usurp the custodianship role of the state and trade the inter-generational heritage of our marine resources to parties who are openly interested only in short-run profits.

ON November 23 and 24, 1994, the marine fishing industry of India spread across nine maritime states covering a coastline of over 7,500 kilometres struck work and came to a virtual standstill. It is our assessment that about one million persons stood off from work at sea, processing plants and markets during these two days as a mark of protest against government policies permitting joint ventures virtual free access to the fish in the Indian Exclusive Economic Zone (EEZ). Considering that this is an industry which is largely dominated by livelihood and subsistence motivations, this is no mean achievement. Another important aspect of the fish strike was that significant sections of fish consumers – whose total number in the country is estimated to be at least 300 million – also consciously chose a fish-free diet on those days.

The credit for this goes to the National Fisheries Action Committee against Joint Ventures (NFACAJV) spearheaded by the National Fishworkers' Forum (NFF), the federation of small-scale, artisanal fish-worker unions of the various maritime states in India. The NFACAJV was, however, a consortium of strange bedfellows – traditional enemies so to speak. The artisanal fishermen were joined in this struggle by the owners of the small mechanised trawlers, as well as operators of export processing facilities. The latter two have always been in confrontation with the artisanal fishermen, during the monsoon months, on the question of regulating the operations of the shrimp trawlers. The clashes between these groups have always posed grave law and order problems right around the country's coastline. But they were together on the NFACAJV having drowned their differences to confront a larger, common foe – the newly arriving larger fishing vessels from foreign waters who have been given a 'blank cheque' to the fishery resources of India. As part of the post-1992 IMF-World Bank monitored liberal economic policies of the government of India, the EEZ has been opened up to 'joint ventures' between foreign and Indian companies. The economic

rationale is that these ventures are 100 per cent export-oriented and this will augment our foreign exchange earnings on the current account. To date about 170 licences involving about 800 vessels are said to have been issued. It is not known as to how many of these licencees have commenced operations. The authorities were however very tight-lipped on this matter following the strike call by the NFACAJV. However, considering that the decision to allow joint ventures in fishing was taken at the highest political decision-making level in the country, there seems to be little chance of an easy roll-back of commitments. One possible scenario is that, in the face of such a hostile environment within the industry in the country, a few of the foreign counterparts of the joint ventures who have received licences may fight shy of making the actual investments.

If joint ventures are a *fait accompli*, as it is made out to be at the political level by the concerned minister, given the state of the resources and the brief history of deep sea fishing using large fishing vessels in Indian waters, what will be the impact of these new joint ventures on the fish economy of India?

RESOURCES

First, let us look at the resources. Making resource estimates of the living marine wealth of the country has not been a major preoccupation of the country's fishery scientists. The estimates which were being quoted with biblical authority were based on an article by three scientists which appeared in 1977 in a non-professional publication [George 1977]. According to this estimate, the maximum sustainable yield (MSY) of the 2.02 million sq km Indian EEZ was placed at 4.47 million tonnes. Of this 2.26 million tonnes (50 per cent) was located in the inshore zone between the coast and the 50 m isobath. New estimates made in 1988 however placed the MSY at only 3.921 million tonnes but indicate the potential in the inshore zone to be 2.28 million tonnes (58 per cent) and in the offshore zone (50-

500+ m) at 1.641 million tonnes [Sudarsan 1988]. Such estimates of relative abundance are however no substitute for knowledge about their spatial and seasonal concentrations. On the whole the resources have a rather low density which makes them largely unsuited to large-scale commercial exploitation. Taking the area of these zones, and their respective MSYs, we see that the density of the fishery resource per sq km is about 70 per cent higher in the inshore zone (11 tonnes) than in the offshore (6.5 tonnes). Based on these official resource estimates and with the assistance of informed industry sources, the market value of the unexploited resources in the offshore zone, which in theory are to be the realm of operation of the joint ventures, were also recently calculated [Giudicelli 1992]. It is estimated that as much as 48 per cent of the resource (0.54 million tonnes) is valued as 'low' (between US \$ 500 and 1,000 per tonne) and 38 per cent (0.43 million tonnes) as 'very low' (below \$ 500 per tonne). The real commercial resources – those which are assessed to be valued above US \$ 1,000 per tonne – account for a 0.164 million tonnes, and of this 60 per cent are located in the west coast region.

HISTORY OF DEEP SEA FISHING

Second, a brief history of deep sea fishing. The involvement of big business in Indian fishing presumably for 'deep sea fishing' is not totally new [Kurien 1977]. There was a phase when the Indian subsidiaries of well known multinational corporations like Unilever, Union Carbide and so forth made their foray into the sea. This phase did not last for very long. The labyrinth of regulations in the country's industrial licensing policies and the organised opposition to 'big, bad, MNC' capital by 'small, nationalist' capital played an important role in curbing and finally phasing out this involvement. Having achieved this, ventures by national capital, encouraged by the liberalisation of the early 1980s, and with the backing of specialised credit agencies, began to dominate the scene. By the post-1985 period there was a rush into "deep sea fishing" with the use of chartered vessels and newly purchased boats as well. The number of deep sea fishing vessels in India rose from 68 in 1984 to 180 in 1991, making for an accumulated HP rating of 28,700 HP to 81,200 HP [Giudicelli 1992]. All efforts were concentrated in the Bay of Bengal for harvesting of shrimp. In a quinquennium, most of the 180 vessels of that fishery were running heavy losses and the credit institutions were straddled with large white-elephants at sea. At the request of the Association of Indian Fishery

Industries and the government of India a study was made by an FAO consultant to examine the measures which could be taken to salvage the situation and suggest ways and means for rehabilitation, redeployment and upgradation of the fleet [Giudicelli 1992]. This report makes an extensive analysis of the resources from a biological and economic standpoint. This is followed by an extensive review of the history and problems faced by the present deep sea fishing fleet. Following this the report concludes that the present critical situation of the deep sea fishing fleet in India does "not reside in the technologies applied, which are appropriate, nor in the shrimp market, which is still strong" [Giudicelli 1992: 27] but rather on six other reasons which are worth elaborating in the context of this analysis: (i) the competition from the small-scale mechanised fishing boats, (ii) the over-capacity of the deep sea fleet in the main shrimp fishery, (iii) absence of attractive markets for the by-catch, (iv) absence of commercially valuable alternative fish resources (other than shrimp), (v) lack of specific professional managers for the fleet, and (vi) lack of stamina of the sea-going and shore personnel.

In conclusion the report suggests that the need of the hour is redeployment by diversification of the activities of the present fleet equipping them with better on-board technologies like winches, hydraulic long-line drums, etc. The existing managers, skippers and crew should be trained and motivated for this redeployment. Some problems are foreseen in adopting this suggested approach. An important one is that "recent policies of the development of industrial fisheries in India rely excessively on foreign input and interference" [Giudicelli 1992: 30].

RATIONALE FOR NEW JOINT VENTURES

Given this status of the fishery resources in the offshore and the history of deep sea fishing in India after 1985 why should new foreign investors and Indian counterparts be vying for the joint venture licences?

Part of the answer to this question is to be found in the present scenario in global fishing. Global marine fish catch has stagnated around 85 million tonnes after 1989. Taking the 15 FAO statistical areas for monitoring global marine catch we see that between 1970-90 in nine of them there is a visible downward trend [FAO 1992]. Taking the world's fishing fleet as a whole FAO estimates that the annual operating costs in 1989 were in the order of \$22 billion greater than the total revenues with no account being taken of capital costs [FAO 1993]. Distant water fishing vessels world over are in particularly bad shape. Their capacities were built up over the years with massive state subsidies which promoted easy

entry. Unfortunately a fishing vessel once built, has a fairly long economic life and little alternative use other than as scrap metal. Redeployment to other less exploited fishing areas is therefore the only solution for owners who wish, for whatever reason or compulsion, to continue in business. Adding to this already grim situation is the fact that, much of the huge distant water fleet of the erstwhile Soviet Union is up for sale for a song. These vessels are on average very large and many of them were basically constructed for total onboard processing of any living resource from the sea. Consequently, second hand vessels for new joint ventures – which is the contribution of the foreign partner – are available at much cheaper rates than ever before. That these vessels are ecologically inappropriate for fishing in multi-specie tropical waters, and more often than not, far above the required specifications is not an issue with the investor. Given that the Indian Ocean is one of the least exploited oceans (though the least productive too) there is a general movement towards this region by distant water fishing vessels in search of obtaining a fresh lease of life.

The liberal Indian offer seems to have come at the right time for them. All the tabs have been taken out of our earlier norms for joint ventures. The state has thus made the Indian EEZ one huge 'open access regime' and the resource is up for grabs. In such a regime there are no 'property rights' – it is 'possession' that is proof of property. Hence the scramble to get at it quickly before too many join the fray. The melee is really not for any particular variety of commercially valuable fish, but for any fish resource which can be harvested quickly in order to obtain a profit on the investment made. From the side of the Indian government they've provided every bait to attract foreign investment: subsidised fuel (cheaper than what the traditional fisherman pays for his kerosene to run his outboard motor); hundred per cent export with permission for trans-shipment at sea (ensures that there can be no check on the nature or the quantum of the resource taken or the level of discards made); no compulsions to dock in an Indian port during operations (no forward linkages into the economy); permission to use any foreign port as base of operation for fishing in our EEZ (encouragement to involve in activities other than fishing which may jeopardise national security).

CONSEQUENCES AHEAD

What are the likely consequences if those who have been awarded the licences actually come to fish?

More Conflict: The majority of the licences have been given for operations along the

west coast of India. As mentioned earlier, in quality and value terms the potential resources in the offshore (beyond 50 m isobath) of this region are the largest in the Indian EEZ. Over 75 per cent of the resources considered commercially valuable and over 50 per cent of the resources valued as 'low' and 'very low' are found in these waters. It must also be noted that the inshore sea of the west coast, particularly off the states of Goa, Karnataka and Kerala are the most productive in the Indian EEZ. However, this is also the region with the highest density of fishermen per square kilometre of EEZ. They are also known to be the most skilled fishermen of the country, fishing in waters far beyond the 50m isobath using their small-scale vessels. Today these fishermen are also the most militant and well organised and have provided the main impetus for the opposition to the joint ventures under the NFACAJV. We have here the right recipe for conflict – bitter conflict. A day before the national fish strike, the government of India proudly announced that the conflict potentials will be reduced because they would implement a 'corridor at sea' which would be enforced by the coast guard. This only reveals further the total lack of understanding of the socio-economic and the ecological realities of the situation at hand on the part of the policy-makers.

Resource Ruin: The quick-profit-making compulsions inherent in the situation juxtaposed over the unchangeable nature of the resource distribution at sea, will combine to ensure a ruin of the fishery resource. Central to the pursuit of profit is the crisis of ecology. In a tropical sea ecosystem, where the specie-interactions are highly complex and little studied, even if we assume that the joint venture vessels stay in the real 'deep sea', the impact which their operations will have on the rest of the ecosystem and the resource therein, are bound to be damaging. Many of the species are 'straddling stocks' which move in and out of the inshore, offshore and the deep sea at different points in their life-cycle. Consequently, merely because resources are harvested in the offshore waters provides no guarantee whatsoever that such action will not affect the valuable resource base in the inshore zone. The point is that our scientific knowledge and understanding of this is limited. This warrants a more precautionary approach to the management of the fishery. Adding more investment into these waters, in an indiscriminate manner at that, is the least desirable action to be taken at this juncture.

Less Fish for Local Consumption: During the week of the NFACAJV's proposed strike, one joint venture vessel (originally a USSR vessel) called at the port of Cochin in Kerala. Her catch was composed of 2,000 tonnes of large perches and snappers – the mainstay

of the hook and line fishermen in the southern parts of Kerala and one of the relished varieties in the local markets. If joint ventures take hold, the prospects of less fish for local consumption is a foregone conclusion. But urban consumers need not be dismayed. An advertisement appearing in a national newspaper at about the same time assures urban Indian fish eaters who buy their fish from the cold-storages, that "Norwegian fish will be flying into India" as though to compensate for the loss of perches to the joint ventures! This honour of being able to eat Norwegian fish is also the flip side of the new liberalisation policy which permits easy imports.

Exploitation of Workers: Ruin of the resources and exploitation of the workers on board the fishing vessels go hand in hand, particularly if the objective of the enterprise is to get away with quick profits. The majority of the crew and the deck hands on these new joint ventures are not likely to be Indian fishworkers. They will most likely be composed of the 'traditional' crew of such deep sea vessels - Filipinos, Thais, Taiwanese, Mauritians and a few Indians. The evidence at hand indicates that the recruitment practices, employment terms and working conditions of these workers leaves much to be desired. The implementation of relevant ILO conventions pertaining to fishermen is often flouted by maintaining that the kind of fishing vessels being utilised exempts them from coming into the purview of these conventions.

Sifting of National Industry Initiative
Such an open-door policy for joint ventures has proven on a world scale to be beneficial only to a handful of financiers and merchants. It promotes global redeployment at the cost of national redeployment. It thus fails to create independent and genuine national fisheries enterprises. The present evidence available points to the fact that very few of the Indian counterparts in the newly licensed joint ventures have any demonstrated history of involvement in the fishing industry. It is reported that very few of them even belong to the Association of Indian Fishery Industries. India is a country with a rich maritime fishing tradition. It has a highly skilled and enterprising fishing community bordering the whole coastline and demonstrated national technological capacity to make our own hardware for the every sector of the fishing industry. Allowing joint ventures a free play is the surest way of sounding the death-knell of national industry. A careful and selective choice of joint venture collaborations, where the nature of investment made is based on our national priorities and needs, by investors with a good track record, is what we must aim to achieve. To achieve this we need an 'umbrella' body which represents the

interests of all the stakeholders in the fishery, including the consumers. Such a body must guide and monitor joint venture operations towards the larger social good, without depriving the genuine investors adequate and sustainable returns.

CONCLUSION

When no explicit property right is defined in a natural resource within a country's territory, we regard the state to be its 'custodian' on behalf of the present and future generations. In the context of the living resources of the Indian EEZ, at stake is more than just the 'benefit' of earning foreign exchange or the 'cost' of ruin of the resource. We are confronted in India with a situation where the artisanal fishworkers, the small mechanised boat operators and a section of the deep-sea fishing operators with some history of involvement in fishing, are all up in arms against the present joint venture policy of the government. It therefore stands to reason that this new policy is fuelled by motivations and considerations which are obviously intended to favour a few but are wrapped in the packaging of liberalisation and free market ideology which is being touted as the only path left to solve our problems. To permit this new policy on

joint ventures in fisheries to proceed tantamounts to allowing a handful of bureaucrats and politicians to usurp the custodianship role of the state and trade this intergenerational heritage of our marine resources to parties who are openly interested only in short-run profits. This is an affront to civil society at large. It must be opposed.

OUTSTANDING BOOKS

INDUSTRIAL SICKNESS IN INDIA

S. S. Khanka

Discusses the growing magnitude of industrial sickness in its various aspects and investigates into the various causes leading to it and its consequences on the economy as a whole.

1995

ISBN 81-7169-316-4

Rs 260.

MANAGEMENT OF AGRICULTURAL POLLUTION IN INDIA

Editors G. S. Dhaliwal, B. D. Kansal

Offers a critical analysis of the role of insecticides, herbicides, fungicides, fertilizers, farm machinery and domestic and industrial effluents in pollution of different Components of our environment.

1995

Gowari Tragedy

Crisis of Maratha Hegemony

Gopal Guru

The recent gowari stampede and the harassment of dalits over the 'gairan' issue in parts of Akola are an indication of the growing crisis of maratha hegemony in Maharashtra.

THE state response to the stampede in which more than 113 gowaris, mostly women and children, died on November 23, 1994, and to the evacuation of the dalits from the 'gairan' (pasture land) through mindless destruction of the standing crops in nine villages of Akola district in September-October 1994, has led to a vociferous reaction, from different sections in Maharashtra. However, some political observers have explained the stampede from an academic point of view, suggesting a need to take a sociological and anthropological approach for finalising the reservation category for the gowaris (*Maharashtra Times*, December 6, 1994). Other scholars and government bureaucrats have taken a constitutional and legal approach towards the tragedy, arguing that reservations to gowaris are constitutionally untenable and socially disastrous (*The Times of India*, November 25, 1994). Certain experts have called upon the bureaucrats and the politicians to explain to the gowaris the constitutional procedure to register their demand (*EPW*, December 3, 1994).

The response of the opposition to the gowari tragedy was not only belated but was also motivated by narrow political considerations. None of the opposition leaders made an effort to approach the morcha and acquaint themselves with the grievances of the gowaris. But once the tragedy occurred, many opposition leaders came forward to capitalise on the issue. The BJP used the issue to settle scores with Sharad Pawar and pressed for his resignation. The assembly speech of the leader of the opposition, Gopinath Munde (BJP), targets Pawar but rarely touches the grave issues involved in the incident: The BJP attempted to win over the fledgling gowari leadership by performing last rites of the deceased gowaris. It now plans to construct a memorial in the villages of the victims. The leader of the separate Vidarbha movement is also reported to have filed a case against the chief minister and the state home minister on behalf of the gowaris. However, this 'legal aid' aims to enlist the electoral support of the gowaris for the party in the coming assembly elections. The role of other opposition leaders was far from satisfactory. Majority of them had volunteered to resign in protest but with

the sole exception of Makharam Pawar of Bahujan Mahasangh, none implemented it. Such half-hearted response made the Congress task of foiling the no-confidence motion tabled by the opposition much easier.

The Congress government cannot be absolved of the insensitivity and the high-handedness that it showed while handling the gowari issue. As is clear from all newspaper reports, the government refused to treat the gowari morcha seriously denying audience to more than 30,000 gowaris. Secondly, the police handobast was far from adequate to manage such a huge morcha. The morcha contained a large number of women but only a handful of women constables were on duty. The Congress ministers did not even visit the wounded in the hospital and express sympathy to the relatives of the deceased. The chief minister chose to remain at Bombay. (Interestingly, during the last winter session of the state assembly the chief minister had rushed to Pune in order to sympathise with the parents of innocent children who were killed in a rail accident.) The home minister of the state visited the victims but later, had a pleasure trip to the tiger park in Tadoba forest of Chandrapur district. The supporters of the chief minister advanced security reasons to justify the latter's failure to meet the victims. That the gowaris were an aggressive lot is a *post facto* rationalisation of the government's callousness. In fact no violent mood was evident amongst the protesting gowaris. Moreover, as a part of *post facto* rationalisation of the police action, the government sources claimed that criminal elements from the mob attacked the police, forcing the latter to take action against the gowaris in self-defence. If the police were attacked, why not a single police was reported injured? The most inhuman part of the entire tragedy was the local authorities cramping the dead bodies of the gowaris into state transport buses. In fact, ambulances from governmental and voluntary agencies could have been made available to carry the dead bodies to their destination. The gowari leaders alleged that they were denied an audience by the Congress leadership of both, the state and the central level. The state government instituted an inquiry committee after considerable hesitation and later out of

political compulsion declared 2 per cent reservation for the gowaris.

The callous treatment meted out by the state government has been read by some as routine hostility of the government towards marginalised sections of the society. Such explanation is insufficient because the Maharashtra government, at least theoretically, has shown concern for the welfare of dalits, tribals and women, and is taking special efforts to organise caste-wise meetings of these groups. In fact, it was the state chief minister who was responsible for arranging meetings of the gowaris with the social welfare minister at Delhi. The press in Maharashtra explained the gowari incident as an outcome of factional infighting within the Congress. This argument projects the gowaris as a captive populace, mobilised mechanically by the factional leadership from Vidarbha. It denies an autonomous political existence to the gowaris who are trying to carve out an independent place for themselves in the Vidarbha politics. This is borne out by their efforts to organise themselves on the issue of reservation since 1980 onwards. Secondly, unlike western Maharashtra, the absence of patron-client relationship in Vidarbha has made it difficult for the Congress to maintain its dominance over the deprived sections of Vidarbha. Thus, the fresh attempts by the other backward castes to organise themselves independently of the Congress in Vidarbha and Marathawada, has certainly influenced the gowaris. It seems that the logic of welfarism no more satisfies the rising aspirations of the subaltern sections of Maharashtra. Further, the promises the state has been giving to the deprived sections has alienated the marathas, especially of Marathawada. This feeling of alienation among the marathas was evident during the renaming of Marathawada university and also, during the declaration of Maharashtra government's women's policy.

In view of the election results of the neighbouring states, the Congress in Maharashtra can ill-afford to perpetuate the feeling of alienation among the marathas who virtually control all the co-operative institutions in the state and decide the electoral fate of 104 MLAs. The Congress has already started to redeem its maratha solidarity. Some important maratha leaders from western Maharashtra have re-joined the Congress while some are on the way. In this context it is important to note that the state government has issued directive to the police officers to withdraw the PCR cases against the marathas of Marathawada. Thus, the strategic location of the marathas at crucial centres of power enables the Congress to be indifferent to the subalterns. The maratha imposition becomes easy especially in those areas where subaltern leadership poorly articulates their rising

ambitions. The gowari tragedy shows that the politics of the dominant will decide the extent of democratic space to be conceded to the marginalised. The gowari issue underlines a shift from the maratha hegemony, mediated by conciliation of heterogeneous interests of the bahujans, to the maratha dominance, intolerant of subaltern aspirations, ambitions and self-confidence.

This shift from hegemony to dominance is also evident in the state response to the dalit land question in Maharashtra. The destruction of the standing crops in the 'gairan' of nine villages, namely, Lohari (khurd), Lohari (budruk), Pathardi, Panchagavan, Akoli Ruprao, Malegaon Bazzar, Ukali Bazzar, Pastul and Chalgawadi of Akola district is the case in point.

The state response to dalit land question has been varied. In the first phase (1959-69), the Maharashtra state appears to be somewhat sympathetic to the dalit question because it is during this period that the dalits could get whatever little land transferred on their name. The Maharashtra government claims to have distributed 1,46,827 hectares of surplus land among 37,370 dalits in the state [R V Bhuskute, Sujan 1993]. This sympathetic attitude of the state was influenced by three factors. Firstly, the huge mobilisation of the poverty-stricken dalits by Republican Party of India (Gaikwad) in 1959 and 1964 forced the state to approach the dalit land question sympathetically. Secondly, the food shortage created after the second world war also prompted the state to allow the dalits to cultivate the gairan on one-year contract basis. Finally, the maratha leadership was responding because it wanted to consolidate its hegemony by entering into an alliance with the maratha. The process of hegemonic appropriation of the dalits was complete when the RPI (Gaikwad) joined hands with the Congress in 1969.

The marathas did not make any organised attempt to oppose the dalits on the land issue. The marathas, particularly from western Maharashtra, unlike their counterparts from Marathawada and Vidarbha, did not have serious problem of surplus land. They had neither to face problem of gairan encroachment by the dalits as the latter had the 'maharki' land which was later cornered by the central government either for constructing the Miraj-Hubli railway line or government offices, schools and hospitals. But whenever there has been an attempt to threaten the land interest of the marathas of western Maharashtra, they have opposed it tooth and nail. For example, the state government in 1971 introduced land reforms which made family, and not the individual, as the unit of ceiling. This was opposed by the rich peasantry of western Maharashtra. As a

result, the state government had to abandon the land reform. However, during this phase, except for one dalit family of Lohari khurd the dalit did not get any surplus land. The struggle for ceiling land was replaced by a struggle for the government land, which for various reasons did not immediately threaten the class/caste interests of the rich and powerful marathas. However, Marathawada Vikas Andolan of 1974 and subsequent factionalism among different maratha groups within the Congress led to cracking up of the maratha hegemony. The hung assembly led by Sharad Pawar took the decision for regularisation of gairan more as need for legitimacy that was necessitated due to the tension with another maratha faction led by Vasantdada Patil. This decision was also influenced by the tribal struggle for government land going on in north Maharashtra. But by and large the decade of 1970-80 revolved round cultural issues that had become a major concern of dalit politics in Maharashtra. However, the common dalits who realised the limits of cultural issues in terms of solving material needs had to plod for means of survival. Therefore, in view of the inaccessibility of the ceiling land, the dalits from nine villages of Akola district concentrated their efforts on the cultivation of gairan. Thus, 1980-90 marked the intensification of the struggle for gairan. During this period the displacement of dalits from the gairan was achieved through terrorism and repression unleashed by the Shiv Sena and upper-caste village goondas, with tacit support from the state. For example, in Lohari khurd (1986), Pathardi (1988) and Panchagavan, the village rich, in the very presence of the police, are reported to have used Shiv Sena and the village muscle power to terrorise and evacuate the dalits. In rest of the villages the upper-caste imposed social boycott on the dalits. In Avahane village of Jalgaon district, dalits were roasted alive by the upper-caste village goondas while skulls of two dalits were shattered into pieces by the upper-castes in Limbani of Jalna district. It is alleged that a CPM activist was killed in the police firing to terrorise the tribals in Nashik district forcing them to forsake the government land. This repression led the left and the dalit groups to form the landless agricultural labour anti-atrocity committee and the land right protection committee. These committees successfully sought the intervention of the state governor. Thus, 1980-1990 represents violent displacement of the dalits by the non-state forms of repression.

But after 1991, one finds the state taking over the task of terrorising the dalits over gairan issue and subsequently displacing them from the land. The shift from non-state

forms of repression to direct state repression has to be understood in terms of the legal protection the upper-castes required. This was evident particularly in case of Lohari khurd in Akola district where the upper-caste village rich feel harassed by their long-pending court cases. In Maharashtra, the state government has used the grampanchayat for the displacement of the dalits from the gairan. The Guiran Act of 1991 came handy for the grampanchayat to alienate dalits from their land. According to the Guiran Act of April 1991, the state government has vested the final authority of regularisation of the land deals with the grampanchayat. Previously, the district collector took the decision regarding the gairan problems. It is possible for the grampanchayat to keep aside some portion of the gairan for grazing and allow the dalits to cultivate the remaining part. But the grampanchayat of the nine villages of Akola district decided to reserve entire gairan for grazing or for social forestry. According to Bhaskarrao Jadhav, a reputed leftist leader, about 50 per cent of the gairan has been handed over to the social forestry department by various grampanchayats in Maharashtra. In fact, if the state government is sincere to help the dalits, it can take away the gairan from these recalcitrant grampanchayats on the grounds of underutilisation or non-utilisation and hand it over to the revenue department for further regularisation. But this has not happened so far. As a result, the grampanchayats all over the state feel free to displace the dalits under the garb of 'social forestry'. However, some grampanchayats, like the CPM-led grampanchayat of Moha in Bead district, the non-dalits allowed the dalits to cultivate the gairan (*Maharashtra Times*, April 12, 1992). Besides the grampanchayats, the local MLAs of Akola district are aiming to displace the dalits of Raundla village under the garb of another environmental issue. The MLAs are interested in constructing a small dam on the gairan owned by the dalits. But the resistance of the dalits and the support from BRP (Ambedkar) has prevented the evacuation of the dalits. But the dalits of Dahihanda, Hingani and Ganori villages of Akola district could not prevent their forcible displacement which was done under the pretext of constructing a 'bandhara'.

These recent dalit experiences of nine villages in Akola district show that the state is using the representative structures, largely dominated by the upper-castes, and the local level bureaucracy and the police force to evacuate the dalits from the gairan. The tahsildar and the police were gifted cattle by the village rich for destroying the standing crops of the dalits. In short, the state response to dalit land question has been coercive.

Opening More Doors

BM

The two new agreements signed between India and the US recently, one a defence pact another a commercial alliance, are an open acknowledgement of the linkage between commercial and strategic interests.

WITH the signing of a defence pact and an agreement on a commercial alliance between India and the US the linkage between the strategic and commercial interests of the two countries, laboriously denied by prime minister Narasimha Rao when on a visit to the US last year, has now been put on record openly. The objective of the defence agreement which was given precedence over the commercial alliance is to make India accept the New World Order under the hegemony of the US and play a subordinate role in that capacity for peace-keeping and stability, above all in Asia. Some contentious issues, such as NPT and Kashmir, will now be addressed in course of time within this framework of the US-India relationship.

As far as the commercial alliance is concerned, India in advance of its signing, had given away during the last three-and-a-half years much that the US economic and business interests had sought in India - open door for the entry of foreign capital, guaranteed high returns and their quick and unrestricted repatriation and foolproof security. The US is now asking for and has secured a dispensation under which US business interests will enjoy a privileged position over and above that of even their competitors in trade and investment opportunities in the Indian market and in terms even of the GATT treaty. Negotiated arrangements from a superior bargaining position rather than competitive bidding will be the norm in the case of US corporations. This will be combined with an institutional framework which will give US-based transnational corporations and associated Indian business interests wide scope and role in taking policy initiatives and indeed, policy-making to further 'free-market reforms' in India. The point, as the US commerce secretary said, is that under US-Indian business-sponsored and driven 'no pressure' will be necessary to facilitate the entry of US business and its interests in India.

The government of India, indifferent to the well-meaning voices of caution raised - the latest being after the fiasco of similar 'economic reforms' in Mexico - is going ahead to reinforce its official commitments to foreign interests, economic, political and

strategic. It has not been deterred by the fact that it has no popular sanctions behind it and even when it is forced to act in a 'temporary caretaker' capacity on many domestic issues. The GATT treaty has been signed and the Indian Patents Act amended by promulgating an Ordinance. India has ratified the bilateral investment guarantee treaty with the UK to cover fully what are called non-commercial risks for investments from that country. All this, together with the defence pact and commercial alliance with the US during the first month of 1995 shows that the government headed by Narasimha Rao, is energetic in advancing the so-called globalisation process in favour of foreign capital. This indeed is the basic thrust of the reform programme. The success of this programme too is measured by its votaries entirely by the foreign capital it can attract, regardless of the costs, economic and political, involved.

With transnational corporations, in particular US-based, given a commanding position in the Indian market, and sanctified by international treaties, the reform process is claimed also to have become irreversible. This means that domestic impulses for and participation in the growth of the Indian economy as well as social equity, already weak, have been made subservient to the interests of transnational corporations. Investment, sluggish as it has been, from foreign as well as Indian sources, would now tend to flow only into the production of goods and services of elitist interest and it would generate minimal new employment and incomes in India. This trend will accentuate even as, repatriation of high returns on foreign investment will drain away, in increasing measure, India's national wealth. Except for a small segment of big business and professional aristocracy in the direct employment of multinational corporations and their collaborators in India, the mass of the working people face shrinking job opportunities even as investment for the production and supply of essential goods and services suffers a sharp decline. Shortages and high prices for satisfying the subsistence needs of the mass of the people in India are already a fact of life. Since gainful employment opportunities are becoming limited, a large number of workers in the large-scale organised sectors of the economy

have been retrenched. The loss in jobs in the organised industry is bound to increase further at a rate much faster than the new job opportunities which are expected to be created by capital-intensive new investment by multinational corporations and their collaborators. Workers pushed out of organised industry will swell the ranks of the unemployed and underemployed.

When the so-called structural adjustment of the economy is conceived in principle and implemented in practice as 'open door' with special dispensation for foreign capital and transnational corporations, its adverse implications are bound to be wide-ranging and far-reaching for the economic growth process and the equity principle. Those who talk glibly about the irreversibility of their misconceived 'reforms' cannot, therefore, carry conviction or credibility with their direct victims. The electorate has already registered its protest in the recent assembly elections. But votaries of the so-called economic reforms are claiming a consensus on the issue on the basis that the state governments led by the parties which oppose the Congress government at the centre too are competing for foreign capital for promoting industrial growth. The position taken by the West Bengal government gives some credence to this claim. This is indeed a disconcerting position when crucial electoral battles are ahead and mass

discontent over the Narasimha Rao government's economic reforms programme is growing.

The cutting edge of these 'reforms' is large-scale retrenchment of workers from gainful employment in the organised industry to assure high profitability for capital, especially foreign capital. The central government too has offered preferential treatment, including fiscal concessions and guarantees for such investment across the board, including in the infrastructural sectors. The argument that governments in West Bengal and other states led by non-Congress parties have no option but to try for a share in the flow of foreign investment to India is highly questionable. It ignores the fact that transnational corporations manage the flow of capital to the so-called emerging markets only to exploit the natural resources and labour of the developing countries and not to generate economically rewarding and socially relevant growth in these countries. It is not at all surprising that already there is widespread discontent not only among the working people but among sections of business, especially medium and small industry, as well. It is indeed a pity, therefore, that the leading left party, CPI(M), and the main centrist party, Janata Dal, should land in an awkward position on the question of foreign investment which will be counter-productive for them on all counts, economic, social as well as political. For any political party imbued with socially progressive and patriotic impulses to take an ambivalent position on this issue can do grievous harm to itself as well as the ongoing popular protest and struggle against the central government's retrogressive socio-economic policies. The left parties, in particular, must not be oblivious of the fact that the ruling coterie of wily politicians running the government at the centre is engaged in selling the Indian market to foreign interests and have entered into subservient political-strategic arrangements with the developed countries, above all US. The failure to take a firm independent stand has often exposed the vulnerability of left leaders to the pressure of the Congress(I) ruling coterie. It is indeed quite remarkable that they should be found in decisive moments to place their faith in status quo and equate government stability – the stability of even a government such as the one headed by Narasimha Rao – with political stability to safeguard the unity and integrity of India. It should not be difficult for left parties and their allies to foresee that the present political and government status quo cannot endure. Popular sentiment is actually vigorously against policies which undermine self-reliant economic growth, mass welfare and sovereignty of the Indian Republic. The policies pursued by the Narasimha Rao government have also unquestionably enlarged the scope for the

reactionary socio-economic forces and ambitious and corrupt individuals to profit at the cost of the people. If left parties and their allies hesitate to take a firm principled

position they will not only hurt the mass interests but will also be marginalised in the fast-changing social and political alignments in the country.

OBITUARY

M Shatrugna

Rama S Melkote

Shatrugna did not belong to any party or even a group. Yet he was politically involved in many ways with left and democratic movements.

THOSE who gathered at the Sundarayya Kala Nilayam on January 6 were a strange mix of IAS officers, teachers from the universities and colleges of the twin cities, activists from civil liberties organisations, women's and dalit organisations, party members of CPI, CPI(M) and ML parties and several others. It reflected the person that was Shatrugna who passed away on December 31, 1994. All those who spoke had one common thing to say – that he was a friend, no matter what differences they had with him. Shatrugna died of terminal cancer of the liver.

Shatrugna – Shatru to most of us – did not belong to any party or even a group. Yet he was politically involved in many ways. A teacher of physics, from the days of being a member of the Marxist study circle in the late 60s, through the days of emergency and post-emergency to the Mandal days, Shatru was actively involved and supported left and democratic movements. In the early 70s when China was a source of inspiration to revolutionaries the world over, there was a move by some in Hyderabad to form an India-China friendship society. Shatru was one of them. Nothing came of it due to differences of all kinds within the group. Shatru took the initiative along with Saral Sarkar and me to start a journal *News and Views on China*. Hardly two issues were brought out when Shatru and Sarkar were arrested under DIR and released on bail. The hearings in the court were obnoxious. One never understood in what way a journal could be a threat to the security of the nation! Soon thereafter Emergency was declared and once again Shatru was taken in under MISA along with several others. Later when Shatru was released, he would recount hilarious stories about prison life – from the petty quarrels over who should cook and what and who should be washing dishes to serious ideological debates.

Shatru was argumentative to the point of being exasperating. Yet he never allowed political differences to mar friendships. When he embarked on his career as a journalist he wrote on various issues – AP politics, left movements and education which became his

area of research. His writings on the Telugu Desam became controversial. How could he support/promote Telugu Desam? Shatru had a certain respect for 'facts'. 'Get your facts straight', he would say. Facts may be 'ideological' but you cannot fabricate them. He had little patience with highly abstract, unintelligible ways of arguing. He never hesitated to say what he thought and felt, however controversial and unpalatable it might have been to the people around. While he supported the dalit movement, and was actively involved in the pro-Mandal agitation, what he wrote in the *EPW* on the teachers' agitation over the non-implementation of reservations in the university did not please some. But, that was Shatru, argumentative, provocative, till he was convinced of the factual veracity of the other side. Shatru was one of the few who have been critiquing education policy and writing about it. He submitted his report on the New Education Policies – a research project supported by the ICSSR. It is hard to disagree with him that whatever may be the grievances of the teaching community at the university level, there is no accountability of the teachers. He recently undertook a project on the Literary Programmes and the Subalterns with the UNDP. It is sad that he could not complete something in which he was so heavily involved.

Shatru's ability to make friends, keep in touch with people, not for his own interests but often to help them, to organise and get going something or the other was admirable. He was a founder-member of the Telengana Affiliated College Teachers Association that fought against the exploitation of private colleagues by managements. Several teachers spoke about the help he extended to them. Shatru never denied help to anyone when he knew he could do something. His involvement stretched from solving the water problem in the locality to helping a widow get her pension, secure a fellowship to a poor student, to writing on state politics. He was somewhat of a link between several progressive groups and movements. In Shatru's death we have lost a friend, I personally a very dear friend.

Health Research in Pakistan

S Akbar Zaidi

The failure to make the conceptual distinction between health research and medical research reveals the major constraint on health research in Pakistan – and on community-oriented health research in particular.

IT is almost impossible to offer solutions to problems, unless we are aware of why they exist in the first place. We need to identify and understand the underlying causes of disease and poverty, before we can proceed to find cures and recommendations, hence the need to do research. The issues in the health sector in underdeveloped countries are multifarious, and incorporate elements related to education, housing and social infrastructure, poverty, access to health facilities, cultural norms, and government policies. For example, a policy of producing highly qualified doctors who are well versed in curative techniques which require imported or advanced technology will almost always result in the doctors living and working in cities and being unable to deal with the diseases which affect the majority of the population. Furthermore, government policies which emphasise curative care at the expense of preventive care will result in a lack of social- and health-related infrastructure with more money being spent on hospitals than on water and sanitation, or on primary and maternal health clinics. Research in health-related issues is the first step in understanding the causes of disease and their subsequent cure.

Research helps in informing the public about the actual issues that exist around the health-disease matrix, promotes basic knowledge about why the problems persist and should offer possible guidelines for policy and action. Research conducted by government organisations can help design appropriate policy for future years and presents a means to evaluate past government performance. Academic and NGO initiated research, often provides an alternative lens through which government (and private) action can be more critically examined. The need for both to co-exist and confer can lead to the evolution of a proper diagnosis and hence to better and appropriate methods of getting to the roots of the problem and subsequently finding adequate solutions. Health research is critical in any attempt to deal with the problems in the health sector.

However, the problem of health research in Pakistan exists at a conceptual level. If we question a doctor about the status of and constraints on health research in Pakistan, and if he takes the question seriously, we will get a standard answer about the numerous reasons why medical research is not an important concern to most doctors. From the very few who actually do some medical research, we will be told about the constraints they face in initiating and conducting their research. Press on with a supplementary

question and ask these doctors whether they think there is any distinction between *health* research and *medical* research, at best one will get a very perplexed and confused look. This failure to make the conceptual distinction between the two, probably reveals the major constraint on *health* research, and in particular socio-economic community-oriented health research, in Pakistan.

Not surprisingly, the single most important reason why there is no relevant health research – or for that matter, even very little medical research – in Pakistan is the value system conveyed to students in medical schools. Doctors are produced so as to be able to provide clinical care, where surgeons and physicians are supposed to function in the particular model of health care which exists in Pakistan. This model is quite typical of other underdeveloped countries where health care is very unevenly and inequitably distributed. Most health care facilities are located in the larger cities – the phenomenon of ‘urban bias’ – while a larger proportion of the population lives in rural areas. Health and medical care is seldom interventionist or community-oriented. The medical personnel pyramid which shows the ratio of doctors to auxiliary staff is almost always inverted: rather than having one doctor to say five or 10 health workers, underdeveloped countries by having produced more doctors than auxiliary staff end up with five doctors to one health worker. The health care model which exists in Pakistan as in most other underdeveloped countries is a highly inequitable, western-oriented, curative care model, which certainly does not fulfil the requirements of a very large majority of the people of these countries.

And so, the doctors that are produced in the medical schools in these countries are supposed to be functional in the environment described above. Their training is supposed to be focused towards the needs of the model of health and medical care, rather than towards the needs of the people of these countries.

In the five years that medical students spend in acquiring skills and education, the subject of community medicine accounts for a mere 6 per cent of their time spent in medical schools in Pakistan. Students have no interaction or first-hand experience with communities, especially with individuals and communities from rural areas. As their background and training is usually centred around the medical college hospital, which is inevitably in a large urban area, the patients, and thus the disease pattern which these students encounter, also have an urban bias. They are not trained to function in rural areas

which in Pakistan account for 70 per cent of the population. A visit to a rural hospital just 50 miles outside Karachi revealed that the three patients who had suffered snake-bite were all being treated by the compounder, for the Karachi-trained medical doctor did not have a clue of either the problem or the cure. Furthermore, the students are not taught in detail about common diseases such as typhoid, diphtheria and malnutrition, since most of their books are written for, and in, the developed countries where many of the diseases of poverty are now peripheral. Also, due to a lack of training in the social sciences, students are unable to see the mechanism at work in the social, political and economic context in which they are expected to work. A survey of medical students in five colleges revealed that only 60 per cent knew the population of Pakistan, while 12 per cent knew the literacy rate and 8 per cent knew the infant mortality rate.

For the above reasons, it should be clear that health research is not a priority area for most doctors, but nor is medical research. Dr Sarwar Zuberi, head of the Karachi branch of the Pakistan Medical Research Council (PMRC), an organisation which is responsible for funding medical research says that doctors and the medical establishment perceive research as an “unaffordable luxury”. According to Zuberi “Research experience is not taken as something which is creditworthy and no incentives are given for research. Research is not a prerequisite for appointment or promotion and there are no academic or financial rewards.” She says that you really have to be “crazy” to do research in this country, for it is “something that is looked-down upon and considered a waste of time which should be spent seeing more patients and making more money”. It is not surprising then that with this attitude of the medical community towards medical research, health research is inconsequential.

This was made clear at a conference held two years ago in Karachi which was meant to address the issues raised in the original Health Research document prepared by the International Commission on Health Research for Development. The focus of the document was to underscore the importance of developing the need to undertake essential national health research which goes beyond the analysis of the health sector alone, and also examines the health impact of development in other sectors and on the socio-economic determinants of health. The Karachi conference was attended by people from the health ministry of the government of Pakistan, clinicians, and some medical doctors who were associated with academic institutions and a minute number of social scientists who were conspicuous because they were so underrepresented. The theme of the conference was Health Research in Pakistan, and culminated in a publication subtitled *Action Plan for the 90s*.

While the intention of the conference may have been the need to focus on the problem of and constraints on *health* research, the

discussion was restricted, almost totally, to medical research. The clinicians and the people from the ministry dominated the proceedings while those who were interested in the real issues were quite easily sidelined. Essentially, the medical community complained that they lacked funds to do their sort of research, and they felt that the government should acknowledge this constraint, provide funds, and also give some recognition to those who are doing this sort of work. The health care model, the value system and training methods, the health and disease issues which face the huge majority of the people of the country, and other real issues, were nowhere on the agenda. Thus, a conference on health research turned into one on medical research, symptomatic of the state of the medical community in Pakistan. The government representatives also played a similar role; as one of the co-ordinators of the conference later revealed, the ministry of health had objected to the participation of academicians and non-medical researchers and failed to understand the need and importance of health research. Furthermore, the agenda and ideas set in the original Health Research document were peripheral to the Karachi conference. The *Action Plan for the 90s* seems to have already fizzled out, and the conference was the first and last, and not so auspicious, landmark in the attempt to discuss issues related to health research.

The little research that there is in health is conducted in three different spheres and while they are independent in their own right, there is clearly a fair amount of overlapping. We can identify the government, NGOs/consultants, and independent/academic institutions and individuals who are involved in health research.

The above remarks about the government's attitude towards health research notwithstanding, the government does conduct some research—after all it does plan, manage, implement and develop the health care system in the country. Pakistan is a signatory to the Alma Ata Declaration promising Health for All by the year 2000. While Pakistan's government may not be in a position to provide all Pakistanis adequate health care even well after the end of this century, some inroads have been made regarding the delivery of adequate health care. The changed international climate and shift of emphasis from curative towards primary health care all over the world, has also had its repercussions on research in health care in Pakistan. Donor pressure has also meant that the government has been forced to alter priorities and directions in its health package, thus resulting in appropriate and relevant health research. Moreover, the government does provide the largest data-bank regarding health (and other) statistics which are used by others interested in research.

NGOs and independent consultants working (most frequently) for foreign donor agencies are to be seen in all social sector areas, ranging from health, to education, to urban uplift, to sewerage programmes, to

environmental issues, etc. They form an educated and (usually) socially conscious group of professionals who conduct studies, or carry out interventions and programmes often on the behest of donor agencies. Because of their growing number, a large number of studies have been conducted with a well-focused approach towards socio-economic health research. Presently, their collective output would constitute the largest share of health research. However, a word of warning is due.

Given the large number of consultants and NGOs in the field of health, it is not surprising that many are incompetent, undedicated and only interested in the huge pay-checks such assignments bring. In most cases, studies are very specifically related to the needs of the client and as one consultant said, "data are frequently fudged to suit the client's needs". Zafar Ahmad, who has had many years experience with a number of international funding organisations working in Pakistan, says that there is no accountability regarding these studies. He says that "the local representatives of donor agencies are usually not experts in their field. Also, they want acceptable reports to be sent to their donors, so they make sure that the reports are acceptable and more funds are released." Since there are no ways of authenticating such health research which is of a primary data nature, one doesn't know how authentic and real the study is.

The Applied Economics Research Centre in Karachi and the Pakistan Institute of Development Economics in Islamabad are two institutions where some individuals work on health-related issues. The Community Health Sciences department at the Aga Khan University (AKU) is another important institution which has been able to develop a large health research, management and health intervention programme. Because this is a medical college, it has access to a very large number of potential doctors, and unlike the economic institutes, the medical personnel—faculty and students—can conduct not only research, but following that, can play a significant role in altering the disease and health structure with the communities with which they interact. Dr Fozia Qureshi, an associate professor and often the acting chairman, feels that "due to the Aga Khan University, people's views regarding health have changed. We have been a crucial catalyst in this change and now people have different views regarding health care, health research, and health management."

One cannot deny the fact that unlike most public medical colleges, the Aga Khan University along with the Baqai Medical College in Karachi has tried to implement important changes. Dr Qureshi believes that "we are changing people's perceptions regarding health care". With 3-400 students available, some impact of these values probably does filter down. Also, the AKU trains all its students in research methodology with emphasis on Epidemiology, biostatistics, and some social science. There are frequent

workshops and seminars with faculty participation where findings from their research is presented. The Community Health Sciences department has a staff of about 40 personnel and promotion to senior lecturer status requires, along with an MBBS degree, an additional degree of Master in Public Health. However, one shortcoming of the department is a severe shortage of skilled social scientists. Dr Qureshi agrees, and says that her department has only two non-medical researchers, because "there is a dearth of good social scientists in our country", a conclusion which would be contested by many.

Despite the work that the Aga Khan University has been able to accomplish, as a catalyst or otherwise, the surprising thing is that there are very few publications from the Community Health Sciences department. Dr Qureshi argues that "while we have a lot of research papers and data, it is not presented in a publishable form. Our faculty are not publishing as much as they ought to because they are very busy." Without the dissemination of research there can be little debate and hence insufficient intervention. Dr Qureshi agrees with this but feels that most of the research conducted by her department is used by faculty and students working on those projects and for their particular purposes, intervention does take place.

Very few professionals in health-related fields appreciate the need and importance of health research. They do not recognise the fact that it is difficult to have adequate and appropriate health care unless one has adequate and appropriate (and sufficient) documentation, analysis, discussion and dissemination of health research. Also, to be able to be effective, health policy must move away from large hospitals and focus on communities and on people. Health research must also follow the same pattern. While some scholars and researchers in the health sector must focus on more global and macro issues and concerns, others will have to identify and study specific problems in specific regions, areas and communities.

Research and the dissemination of information and knowledge is an essential requirement for better understanding whether it be health, education or any other concern. Unless one knows, understands, and interprets the world, one cannot change it. In Pakistan, the status of health research is dismal. A conscious effort must be made to demonstrate the urgent need for more and better research. Relevant health research, where social, political and economic issues are central to the health and disease matrix must be encouraged and supported. Only then can we have better health care, and only then can we hope to provide Health For All in Pakistan, perhaps not by the year 2000, but soon enough.

Seduction, Speeches and Lullaby

Gender and Cultural Identity in a Tamil Film

C S Lakshmi

After its formation as a separate party in 1949 the DMK in Tamil Nadu used the cinema effectively to project its identity, political claims and elaboration of Tamil culture. The film Parasakthi is a landmark in this context and it is useful to examine the construction of cultural identity in the film and its references to gender in the process of this construction.

I HAVE chosen to write about a film released in 1952 for several reasons. It is five years after independence and it is three years after DMK was formed as a separate party stressing dravidian identity, with political ambitions to enter electoral politics. The film was dubbed anti-god, communist, 'anti-establishment' and there was a move to ban the film. That the film was really an effort to 'soften' earlier radical statements on religion and an attempt to project a more favourable and acceptable image for future entry into parliamentary politics has been pointed out by recent research [Pandian 1991]. The purpose of this note is not to debunk radical claims made by a political party, for its attempts to compromise are quite obvious. What we are interested in is the construction of cultural identity and the utilisation of space and language in the film and its references to gender in the process of this construction and the elements that have gone into this construction.

The DMK Party (Dravida Munnetra Kazhagam) had been part of a movement that began in the 20s to stress a dravidian identity with Tamil language, literature and lifestyle as the core of this identity. The movement was to find the lost dignity of the non-brahmins as opposed to brahmins who were considered outsiders and non-Tamilians with a Sanskritised past. In order to anchor its cultural identity the movement had time and again resorted to the use of language conventions and images of a past which was considered glorious. In this reclaiming of the past, gender was framed in specific ways. Men became warriors fighting battles to protect the honour of a nation and women became not just preservers of culture but embodiments of culture literally containing the culture within their bodies which got loaded with notions of purity, chastity, language, nation, etc [Lakshmi 1990]. The oratory platform,

print media and theatre were used as major areas of intervention in these years. Pamphlets elaborating the dravidian-identity claim, journals espousing their cause of social and political dignity and plays of parody were the modes of intervention. After its breakaway in 1949, the DMK Party continued to use the same methods but also discovered cinema as an additional space from which to project its identity, political claims and elaboration of Tamil culture. A film made in 1949, for which their leader C N Annadurai wrote the script and dialogues, was indicative of how the woman who had become as much part of the public sphere as man was going to be seen in reference to a Tamil past. The English-educated, 'modern' woman in this film was dressed in pants, played tennis and was rude and arrogant. She is finally brought back to the fold by a man, of course. Controlling a woman through marriage has been an image that has continued to haunt Tamil films. A later film which was produced by a leading DMK personality has a song describing the kind of bride needed [Lakshmi 1990]:

Wanted a bride
a good bride
Even if she gallivants freely
like the temple bull
romping around with no one to check her
I shall put a string around her nose and
drag her and control her
I shall make her as patient as a buffalo.
Wanted a bride
a good bride.

The 1952 film, *Parasakthi*, was not different in its intentions but was a much more elaborate, deliberate attempt to reclaim images and languages from the past and superimpose them on contemporary images and events in a stylisation that would continue to dominate the Tamil film in years to come.

The story has to pick up a period of struggle, since 1952, the year it was made, was not a year characterised by any specific political struggle. The chief minister at this time was a brahmin and there was a drought in this area around this time and the chief minister was coping with the problem in several ways and he had asked the people to pray to the gods for rains to come. By itself this is not a good enough background to voice grievances or proclaim a cultural identity. So the story moves back to 1942, a time when identity claims had been vociferous. It is a war year. Many Indians from Burma began to come back to India, many of them walking the entire distance. There were many Tamilians among them. This provides a sufficiently undefined, unstable space to mount a story of lost and found relatives, abandoned women and coincidences. The story is about a Tamil family where the three brothers have gone to Rangoon to make a living. They are successful. The elder brother is a judge and the other two brothers live with him, not yet into any specific profession. They have a younger sister back in India whom they have not seen. They get a letter saying that her marriage has been arranged. A sister's marriage is an occasion that no brother would miss. All of them want to go. But due to problems of war only one ticket is available. They decide to send the last brother. He reaches Madras and on the very first day loses his money to a dancer who cheats him. He is penniless and begins to wander around like a mad man looking for his sister. He finds her but as a widow with a child making her living selling 'idlis'. He does not tell her who he is as he is ashamed of not being able to help her and protect her economically as a brother should. The widowed sister is harassed by many men and at one point decides to kill her child and die. She throws the child into the river and jumps in herself. But she is arrested and brought to the court for killing her child and attempting suicide. Coincidentally her own elder brother is the judge. But she does not know him. When he finds out who she is with her description of her life, he faints and takes ill. Her other brother, who hears of her harassment, attacks the temple priest who tried to rape her and is brought to the same court. By another strange coincidence everyone who troubled her and the woman who enticed him to go to a dancer are all in the same court being tried for some crimes. The hero then elaborates on the corruption of the society. Before this he has met a different kind of a woman who can talk about social revolution and who is in the habit of going

on boat-rides on moonlit nights. The court room drama comes to an end with her coming and declaring that the child had never been killed. It had fallen into the boat and she had saved it. The family gets together once again and the hero, now dressed appropriately in western clothes, is all set to marry the 'new' woman – not in the old ritualistic style of marriage but in the new style of just exchanging garlands with a political leader or any important personality who can give a speech officiating.

STRUCTURING SPACE AND CHOICE OF PROTAGONIST

The national movement and the self-respect movement had altered the geography of cities and smaller towns. Madras, Madurai and Tiruchi especially were cities that saw many changes. Women had poured into the streets protesting against foreign rule, singing national songs, walking on the streets, going to jail and being received with garlands at railway stations on release, proclaiming from platforms and demanding reforms and changes and political rights, organising marches against Hindi, meeting to give speeches on Tamil culture and travelling around supporting either the nationalist cause or the cause of a language and culture. Women had been taken to courts for supporting causes. The film reclaims this space and alters it. The streets, the court and the platform now become spaces from which men function. Women enter this space in marginal ways as vendors or in other unnoticeable ways. The streets suddenly become dangerous for them to move about unprotected by men of the family. Some moonlit boat-rides are possible but only in a fictionalised space. Tiruchi, where these boat-rides take place in the film, does have a river but whether women took boat-rides there on moonlit nights by themselves is not recorded history. Creation of this fictionalised space is interesting for it is an uncontested space with no specific qualities to it.

The streets become fragmented spaces in the film, not leading anywhere in particular, almost dead-end in character, looming large, gloomy and dangerous when the widowed sister walks on them and turning into abandoned roadsides when the protagonist uses them as platforms to talk, with broken walls and overgrown shrubs (obviously studio-sets) with an occasional moon when the sister sings sad songs. Each specific space becomes a symbol of corruption and degeneration of a culture. The very first introduction to Madras is with a beggar accosting the hero and the hero comments that the very first voice in Tamil Nadu is that of a beggar. Then comes the hotel where he stays. It has degenerated into a

place for procuring and then comes the place of the dancer. This is another fictionalised space for there is no record of dancers performing in their houses to entertain specific customers in south India. Creation of this space is fraught with meanings. It is a space transported from the classics to modern times. In the Tamil epic *Silapadhikaram* there is the dancer Madhavi who belongs to the Devadasi community. She gets into a relationship with Kovalan, the hero of the epic, and

Kovalan loses all his money to her. The space of Madhavi is recreated here and the dancer cheats him of his money, almost making us feel that even though the Tamil man has traversed centuries away from the epic *Silapadhikaram* he has only one way of getting cheated!

A space to appeal for justice has existed in the Tamil culture in the courts of kings. Women like the epic heroine Kannagi have entered these courts independently and spoken for themselves. So have women in

OXFAM requires

REGIONAL REPRESENTATIVE FOR NAGPUR

Oxfam, a relief and development agency, is looking for a Representative for our Nagpur office to provide overall leadership to the regional team and management of our work in the region. The Nagpur office covers Maharashtra and Madhya Pradesh.

Candidates should have relevant qualifications, a minimum of 8 years of development experience preferably with NGOs, good analytical and strategic planning skills and understanding of development issues, commitment to social justice, team management experience including finance, research and evaluation experience, good administrative and communication skills, sensitivity to the inequalities facing women in society, willingness to undertake considerable travel, ability to speak fluent Marathi/Hindi and also fluency in written and spoken English.

We offer a 5 year contract and reasonable salaries and other benefits to attract competent professionals.

Apply with full CV and a covering letter explaining fully from your experience how you meet the criteria listed to Oxfam (India) Trust, C-6/59 Safdarjung Development Area, New Delhi - 110 016 before 3rd March 1995. Only shortlisted candidates will be contacted for interviews to be held in Delhi on 27th of March 1995. No enquiries over phone or in person please.

modern times during the struggle for national independence and during the anti-Hindi agitation. This court is turned into a space now where attack is mounted upon an unprotected woman who needs a man to comment on the life of a woman. A space where women have spoken now becomes a space to be occupied by heroic men whose duty it is to protect and guard women so that they can lead a decent life. The safety is within the home, within walls to protect her chastity with men taking over the running of the world outside.

The choice of a protagonist who for three quarters of the film is pretending to be a mad man talking at length about politics, life and human beings is a choice based on contemporary times. The Charlie Chaplin image of a clown-philosopher had already caught on in India by this time and Raj Kapoor was trying to arrive at an Indian version of it. It was an extremely popular version. The Raj Kapoor version of a vagabond do-gooder who is also a symbol of protest is taken and altered into a mad man living on the fringes of the society to push the message a little harder. As a mad man he symbolises the combined fate of the Tamils exploited and pushed to the fringes by the north and by brahmin rule that was supporting the northern domination. The choice of a mad man appears to be for several other reasons too. One advantage in the main character pretending to be a mad man is that any kind of dialogue or monologue can be put into his mouth and by that act the film will carry within it a defence for the utterances of the hero: a mad man's rantings need not be taken seriously. This is to assuage the censor board. In his 'mad' moments the hero is a person indicting the society for its politics and corruption. In his sober moments he surfaces as the Tamil man as he ought to be in the conception of the script-writer: a protector of family, a lover and a man with a mission. The actor who plays the hero is a DMK activist at this time and he is obviously seen and presented as the voice of the party. The party is not only putting together its politics but it is clearly making a gendered division of spaces that is going to characterise its politics in the future.

LANGUAGE MODES AND GENDER

For structuring its language the film chooses a variety of elements from the cultural past. It uses the language of the Tamil epics, of Tamil folk legends and folk theatre and poetry. The Tamil epics *Silapadhikaram* and *Manimekalai* are referred to in specific ways. The folk-legend of Nallathangal who killed her seven children because she could not feed them becomes the motif for the widowed sister's life. The predominant mode of lullaby

which are very often songs that women improvise is used to describe an ideal Tamil family where a sister is protected by her brothers. The folk-theatre is always performed on the streets and the hero of the film is ideally located for utilising this language. He uses the folk-theatre mode of singing for his political commentary.

The entire spoken language of the hero is in the form of long monologues and the folk-songs or poetry set to tune are only an extension of this monologue. This pattern of poetry taking the place of the spoken word is carried out throughout the film. The widowed sister sings two songs both of which are about her present state of helplessness and her hope of meeting her brothers. A poem written by Karunanidhi, one of the leaders of the party at that time and who was later to become chief minister of Tamil Nadu, about the ideal Tamil family was written in the form of a lullaby. The widowed sister sings it to her child. The song recalls the custom of maternal uncles giving gifts [Lakshmi 1990]:

... you have three maternal uncles little boy

They will come to give you a good life
They'll come to kiss you on your
cheeks fleshy like a mango

A milk-feeder made of precious stones
A cradle of emerald

Even a white-elephant for you to ride
Your uncle will offer as *stri-dhan*

With silver slate and
a diamond pen, your

uncles will come to put you in school
to learn pure Tamil.

The lullaby is the voice of the woman normally and there are some beautiful lullabies in Tamil where the woman would give voice to her grief or happiness or hopes. The lullaby-mode is appropriated here using very similar language but politicalising it in such a way that it comes to represent an identity and an idealised domestic space where the woman occupies a specific role. It is in the voice of a woman, it is sung by a woman and its lyrics are close to what a woman would use, but it gets transformed into an act delineating the space of a woman in an ideal Tamil society. Since what is 'authentic' Tamil family or society is what anyone can construct from her or his choice of images chosen from the Tamil past, an obvious choice is made here. The marching days are over. Here come the days of taking care of the family, leaving politics to the men.

The language of the woman who protested against Hindi and worked along with her male colleagues is not abandoned; it is toned down in such a way that it does not seem like an effort to enter any space not meant for her. The 'new' woman is presented as someone with a mind of her

own but not so assertive that she will take over the job of acting out her ideas. She is the inspirer goading men on to action, willing to support and help but never taking over. Her long speeches on social revolution are made within the confines of the home whereas it is her brother who gives lectures on public platforms. Even her speech on social revolution is created to her brother. The 'new' woman is bold enough to hold her man's hand casually, call him by his name and address him in the singular and even intersperse her conversation with English, but her monologue when the hero leaves looking for his sister without taking leave of her is to wonder if he left her because she was an idealist. An idealist does not have to be a Manimekalai (who became a saint) but can be a Kannagi, she says. That particular monologue is a very crucial one in terms of the politics of the film. The leader of the self-respect movement, E V Ramaswamy Naicker or Periyar as he was known, had given many fiery speeches in the 30s on why a woman had become a slave in the society. He had made specific references to the notion of chastity and its binding on women. His critics used to reduce this to very simplistic levels and say that Periyar advocated that women must not be chaste. The DMK party does not want any doubts regarding this matter. It makes it clear that chastity is a yardstick it is not in a great haste to abandon. In fact, the character of the sister is built around this notion. Her entire struggle after she is widowed is to maintain her chastity which she finally manages to put in the protective hands of her brothers. The 'new' woman who aspires to be a Kannagi is not really different, except that she speaks at times a different language. Widow-remarriage had been a major reform advocated both by the nationalists and those in the self-respect movement. It is an issue the film does not raise. The entire political criticism of the film is in the realm of statements against the then government and economy. The changes sought are in that area. The space occupied by the woman herself is shifted to the home, overlooking many cultural images from the past of her being outside because the cultural identity is sought by fixing her space and body in non-problematised zones. The woman becomes the guarantor of authenticity by occupying an unsullied and 'pure' space.

Anthropology as Cultural Criticism

Rahul Srivastava

Critical Events: An Anthropological Perspective on Contemporary India by Veena Das; Oxford University Press, Delhi, 1995; pp 230 + viii, Rs 350.

THE book under review may surprise those who are unfamiliar with the changes taking place in the discipline of social anthropology. The author's subject matter and its treatment are a departure from more conventional studies in the field. Das is neither studying an 'exotic' community (in a temporal or spatial sense) nor has she chalked out a fixed period of time for her 'field work'. Such restrictions have been challenged by the practitioners of social anthropology and her writings assume a familiarity with the debates involved. Her field is the open-ended space of contemporary India which includes past memories and its consequences in the present. She is intimate with her field at different levels, public and private, personal and political (though she acknowledges overlaps between these categories). Her anthropological approach comes closer to George Marcuse and M J Fischer's vision of anthropology as a form of 'cultural critique'. The approach is an intellectual response to the contemporary world using cross-cultural and historical perspectives and is acutely aware of the politics involved in inscribing itself within and outside academia.

Critical Events covers recent debates around cultural and political events in India. The author weaves critical questions into her narration of these events, questions related to the language and categories involved and their political consequences. Among the issues discussed are the response of the state to the incident of mass abduction of women in India and Pakistan during the partition, the Shahbano and Roop Kanwar controversies, Sikh militancy and the Bhopal tragedy.

The author confronts a number of dilemmas which a student of social anthropology in India often faces. These are linked to the peculiar tradition of the discipline wherein the anthropologist has usually studied communities to which she/he has been a complete stranger. The dominant theoretical orientation of the discipline assumes such a distance which it valorises in the name of objectivity. Thus when a 'native' scholar makes an anthropological inquiry into her/his own people s/he is extremely vulnerable to criticisms from the established intellectual tradition of the discipline. However, the practice of social anthropology in India is an old one and a number of scholars have challenged both the narrow definitions of

the discipline as well as the categories of familiarity, distance and proximity with which it works. In this regard, Das refers to the contributions of T N Madan and J P S Uberoi who have, in their own way, brought nuances to the disciplinary practice in India.

The author tackles the provocative statements of Louis Dumont in an engaging chapter, 'Anthropological Discourse on India'. By distancing herself from both Dumont and one of Dumont's severe critics, A K Saran, she attempts to establish a method of conceptualising India which depends neither on the "notion of progress in order to critique tradition" (p 53) nor on constructing a nostalgic vision of the traditional community to critique modernity. She wishes for a cosmopolitan academic atmosphere where scholars from the west interact with the 'native' ones to further their understanding of the subject. Her complaint against the western academic world is that scholars belonging to the community being studied are often dismissed as being influenced by western political ideals. Dumont viewed Indian scholars writing on caste in a similar way, perceiving their understanding as tainted by the desire to be part of the modern world. Such a stand leads to a hyper-nativist critique like that of Saran which Das finds equally problematic. What is particularly interesting is her contention that the debates within the academic walls of anthropology also get reflected within public discourses, especially when issues like culture and identity are involved. Thus notions of 'authenticity of tradition' or 'the superiority of western political ideals' are found as much in the arena of public discourse as in the intricate debates within the departments of anthropology.

Students who have often grappled with the philosophical queries of Euro-American intellectuals and have had to translate them into more familiar contexts will immensely benefit from the book. The author does not reject Euro-American analytical and conceptual tools as being alien, but questions them in the light of specific histories of India. They are tested purely in terms of the questions they raise and those they choose to ignore. One finds the author attempting to develop heuristic categories which reflect the complexities she is looking for. Thus, for example, she tries to escape a vision which projects a dichotomy between

'individual' and 'community' (leading to arguments been drawn in the direction either of 'individual freedom' or 'community control') by substituting the word 'victim' for the individual and thus changing the flavour of the argument. This is a useful device as it helps us contextualise the way the state, the community and its people are related to each other in concrete moments. Many of her assumptions around the category 'victim' are outlined in a thought-provoking essay entitled, 'The Anthropology of Pain'. The essay deals with philosophical and anthropological discussions on pain: the ability or inability of pain to be communicated, the use of pain by society to imprint itself on its members, etc. Agreeing with the view that pain can be a shared experience in the sense that one individual can experience the pain of another, the author gives a special resonance to the meaning of suffering which consequently allows the word 'victim' to emerge as an important political category.

The discussions in the book reflect a critical understanding of the political values embedded in conversations, narratives, legal documents and historical records and the consequences of such value systems for its victim. In the discussion on the abduction of women during the partition, the author delineates the state as a cultural make-up of a status-conscious honour-bound patriarch where the values of the family get highlighted at the cost of the biographies of women who survived, sheltered by new families belonging to other religions. In the eyes of the state these women had to be restored to their rightful owners, thus constituting the nations of India and Pakistan as metaphoric expressions of the family. The biographies of women who survived murder or death were erased not only from the collective memories of the concerned families, decades after the events, but even from the conversations, legal records and political speeches inscribed during the actual events. In the words of the author, "In all this discussion we see that women are being redefined as semiotic objects on which the actions of the state are to be inscribed. Was there any concern for the rights of those women themselves, as distinct from the demands on the state made by their relatives and the state's construction of national honour?" (p 71)

In the discussions on Shahbano and Roop Kanwar the hegemony of the community is analysed in relation to the complex issue of cultural rights, the role of the state and the demands of modernity. The actors in both these cases challenged the state and also defined 'community' in a way which homogenised its individual members. But

the author reveals the concept 'community' as essentially hiding an asymmetrical gendered world-view which divides the private and public spheres into the female and the male. This has entailed an exclusion of the women from participating within the public sphere. As a sequel, the male voice is often seen as speaking for the community. While the cases of Shahbano and Roop Kanwar are conventionally represented as a conflict between "two different kinds of communities (e.g. Muslims and Rajputs) on the one hand and women's groups on the other" this could be changed into a conflict *within* a community if women were to lay greater claims to the public cultures of filiative communities themselves" (p 115). As an illustration the author shows how women in Rajasthan worshipping sati shrines may have a different worldview *vis-a-vis* the glorification of sati *per se*. The author does not essentialise the act of women worshipping at sati shrines as representing tradition; instead she suggests that increased participation of women in the public discourse may transform the very discourse around sati at the popular level itself. Similarly, while the Shahbano case could be seen as a political discourse juxtaposing the community against the state (Das outlines a number of complexities in this argument regarding the biases within the legal statements on Muslim personal law) she also views Shahbano as a woman who became a victim of gendered power games.

The lense of gender is again used in the discussion on Sikh militancy. Even as the author mentions a number of other variables which are involved in the discourse (like the construction of a historical memory) what is underlined is the rhetoric of the masculine and the feminine which defines the Self for both the individual and the community. The author relates these conceptual systems to the justification or condemnation of violence which the community has faced during the political turmoil of the last decade. In the past the Sikhs shared a common experience of identification with the Hindus which have become their conflicting 'other' in the present. Contrarily, their conflicting 'other' of the past, the Muslims can now be identified as a co-victim in the present. The way members of the community make sense of historical complexity is by resorting to a dualism where qualities are understood as masculine or feminine and these get transposed into wider conceptual systems.

The essay entitled, 'Suffering, Legitimacy and Healing', studies the Bhopal gas tragedy in the context of the legal battle which its victims had to undergo and the eventual watered down judgment which almost let Union Carbide go scot-free. The judgment generalises the whole

event into an amorphous vision of modernity where the element of 'risk' takes on a peculiar role allowing actors of modernity like the Union Carbide to live without guilt at the calamities it bestows on structurally weaker segments of society. Das shows how intimately entwined within legal rhetoric are mechanisms which allow such incidents to be accepted as unfortunate side-effects of the advances of science and technology even though the rhetoric is couched within an apparent concern and sympathy for the victims. In this case, modernity does not have to be concerned about the accidents of technological disasters and its very definition makes it demand martyrdom in the name of progress without the fear of being labelled 'barbaric' or 'medieval'. The nexus between bureaucracies, legal infrastructures and the state, both within national boundaries and between nations is strongly underlined.

The discussions in the book attempt to problematise the relationship between the state, community, individual and culture in contemporary India. In the process, the author forces the reader to re-visualise some of these concepts, devoid of the rhetorical stance they assume in certain historical contexts. For example, in her essay on Sikh militancy she states, "...there are limits to an analysis that rests completely upon discursive practices in the creation of militancy, for clearly the militants who engage in spectacular killings are not

produced by that discourse alone. Non-discursive practices, especially the institutional and the pedagogic, exist hand-in-hand with the discourse to form a heterogeneous totality... what an analysis of the *discourse* permits however is an insight into how individual acts of violence may be reclassified and reframed as acts committed on behalf of the community. It is important to note that even in militant discourse the references to violence are framed in ambiguity" (p 11). This is a very revealing statement, yet it also brings out the limitations of her analysis. Unlike Sikh militancy, the author does not see the state as comprising a series of heterogeneous experiences and discourses within itself. Only the relation of the state to other factors are analysed. Thus the discursive practices of the state in relation to communities or victims are analysed in detail and the discourse of agencies within communities or even the heterogeneous existence of the self are given adequate attention, but the experience of the state as representing multiple historical moments is ignored. On the other hand if the overwhelming role of the state as a homogeneous voice during these events is justified then equal attention should have been paid to class as a strong presence. Even though economic determinist perspectives on culture have been very often myopic, one wonders whether a reaction by underplaying the material basis of experience may take us any further.

ORGANIZATIONAL ETHNOGRAPHY

V SUCHITRA MOULY and JAYARAM K. SANKARAN

Social scientists involved with the study of organizations have become increasingly sceptical about the ability of conventional, quantitative techniques to fully comprehend organizational realities. At the same time, there is a serious lacuna in existing research on Indian R & D since there is a distinct lack of in-depth, qualitative studies. This book addresses these two related issues. On the one hand it seeks to introduce the relatively new qualitative paradigm of organizational ethnography as a viable mode of inquiry into organizations, while on the other it demonstrates the potential of ethnography to provide penetrating insights concerning R & D organizations.

However, the study evokes some powerful images in relation to culture. Though Das deconstructs legal practices, a strong sense of justice surfaces in her very conception of everyday life. Thus, while demarcating culture from the proprietorial hold of community, state or individual we are proffered an image of culture derived from the metaphors of justice. Moreover, in her choice of presenting the anthropological subject as a moment rather than being spatially located, she departs from conventional 'disciplinary' techniques and gives prominence to the 'script' of everyday life, which encodes the concepts of rights and justice. Such formulation helps us escape the limited view of culture as community with a boundary or as linked to demands of the state. By paying attention to these narratives, Das subverts the image of traditional ethnographic practice wherein an

anthropologist 'glazed' at the 'objectified' other. Instead, she uses the image of 'hearing' multiple voices in a sensitive and plural exercise of dialogue. Even if there may be disagreements with some assumptions of the author, it will be difficult to ignore the questions she raises. The resonance provided to the category 'victim', shorn of condescending or passive images, the sharp focus given to the question of justice even as legal discourses and practices are exposed as hiding specific interests, the powerful image of gender as linked to community, and the possibility of visualising culture as derived metaphorically from the processes of legality are some important ideas which provide food for thought. *Critical Events*, by attempting to live up to the ideal of anthropology as 'cultural critique', sets an agenda for a number of debates which are relevant within and outside academic circles.

feudalism. Since it has not happened the way it might have, rather a feudalism from below has taken over the place of feudalism from above, and since the anti-feudal struggle, as well as the harnessing of the anti-feudal forces, are still very much the high priorities in today's Bihar, all perhaps had not gone on exactly well with the kisan mobilisation that the Swami-led BPKS built up in Bihar of the yesterdays. This feeling of doubt has in due course led to an attempt at reviewing Sahajanand and his movement, and at expressing different opinions about them during the centenary year of Sahajanand's birth.

The opinion, as expressed in the two issues of the *Economic and Political Weekly* of April 1 and August 19, 1989 (in the shape of two articles by D N, entitled, 'Swami Sahajanand and the Kisan Sabha', and 'Iconoclasm Is Necessary', pp 660-62 and 1921-23, respectively) gives Sahajanand and the BPKS credit for taking in the agrarian situation of Bihar the side of the oppressed against the oppressors and for their building up a movement that weakened feudalism and led to the abolition of *zamindari*. But the author feels that the movement could not become "a full-fledged anti-feudal movement", remained confined, and consequently was exposed to steady erosion for two debilitating factors: one, its preoccupation with the occupant tenants at the expense of the interests of landless agricultural labourers, and even the under-tenants and sharecroppers, and two, its 'upper caste' bias, resulting in the neglect of the lower castes, particularly the dalits. On examination, both these appeared to this reviewer, at best, to be half-truths. Half, because, despite the Kisan Sabhas being a platform of all categories of peasants – rich as well as poor – like the Aesopian stream which quenched the thirst of the tiger and the sheep, Sahajanand and the BPKS had fought with all their might more for the poor peasants, the under-tenants, or the tenants-at-will, than they ever did for the rich and the protected occupant tenants.

To understand this, one has simply to refer to the *Bakshi* peasants' epic struggle (1937-1942 and 1946-1948) against eviction, and for the defence of the lands they tilled and the crops they raised. Besides, if for some reason (which is not known yet) Sahajanand and the BPKS could not come to the aid of the Santal 'bataidars' agitation in Dhamdaha, Purnea, between 1938 and 1942 (as has been pointed out by Anand Chakravarti in his 'Unfinished Struggle of Santhal Bataidars in Purnea District, 1938-42', *Economic and Political Weekly*, October 18, 1986, pp 1848-58), they had no hesitation in taking up the sharecropping tribal peasants' causes elsewhere, notably in Palamau in September 1940, in Dumka in

Sahajanand and 'Khet Mazdoors'

Amit Kumar Gupta

Sahajanand on Agricultural Labour and the Rural Poor edited by Walter Hauser; Manohar, Delhi, 1994; pp 238, Rs 250.

SWAMI Sahajanand Saraswati was born Naurang Rai in 1889, turned an ascetic in 1907 and moved to the bustle of public life in 1917. In 1920 he began to organise the *bhumihar* brahmins on ritual-reformist lines but soon turned to Gandhian politics. From 1934 however, disenchanted, he began to organise the suffering 'kisans', with whom he worked until he died in 1950. The kisan movement, the Swami, and others like him, tried to build up a countrywide scale, and under the banner of the All India Kisan Sabha (1936), was designed to challenge the upholders of colonialism in India – the indigenous feudal exploiters in its overwhelmingly vast countryside, and their overbearing protective, expropriative British raj. In vigorous pursuance of this two-fold task of anti-feudalism and anti-imperialism, Sahajanand devoted 16 rich years of his life. Although he was active practically throughout the country, and he attained the stature of a truly national figure, the epicentre of all his acts of political tremor remained the province of Bihar. It was mainly for his non-party, left-wing career as a militant kisan leader of Bihar, as of course, of the whole of India, that Sahajanand has carved out a niche for himself in the Indian history of the 20th century.

Evidently Sahajanand's role in accelerating the process of peasant mobilisation, his role as its publicist and theoretician, and his activity as its foremost leader, particularly

in the context of Bihar, has to be taken into serious account by scholars working on contemporary India and its people. In the last 30 years or so a number of research works have been published which have assessed the Swami's over-all contributions favourably, and highlighted his relentless anti-feudal campaigns. But of late certain misgivings about Sahajanand's strategy against feudalism in the colonial days appear to have crept into the minds of some scholars, as well as of a sizeable number of political activists who are committed to the cause of a qualitative change in present-day agrarian society. These misgivings, it seems, are borne out of the stark realisation that the feudal mode of exploitation has not only survived significant agricultural changes in post-colonial India, but has remained the dominant factor in many parts of the country, and especially so in Bihar – where landlordism, extraction of rent, sharecropping, usurious practice, bonded labour, caste-based division of work and patron-client relationship of the *jajmani* type are still ominously operative. If the Bihar Provincial Kisan Sabha's campaign against feudalism was indeed on the ascendancy in the colonial period as it has been made out, then the feudal forces ought to have been cornered in the post-colonial decades following the abolition of *zamindari* in 1950, if not rendered moribund, and more importantly, the anti-feudal popular forces should have become strong enough to deal a death blow to what remained of

November 1940, in certain other parts of Santal Pargana in April 1943, and also of the sharecroppers on 'bhowli' lands in Patna and Gaya throughout 1946-47. Ideologically, they appeared to have no reservation against either the tribal peasantry or the sharecroppers.

Similarly, Sahajanands and other BPKS leaders belonging to the upper castes - who did not so belong among the organisers of the toiling people's movements in India of the time? - do not seem to this reviewer to have stood in the way of mobilising the people of the middle agricultural castes, the kurmis, the koeris, the yadavas - as well as those of the lower middle castes. A widespread militant rising like that of the *bakasht kisans*, and an animated agitation like that of the *bhowli kisans* could not have taken place without the massive participation of most of the agricultural castes. In view also of the radical conviction in the 1930s and 1940s in the theory of class struggle as the panacea for all caste and community contradictions and therefore, of ignoring such contradictions it needs some wild imagination to see Sahajanand and his comrades in the upper casteist garb. But then the scope for taking such wanton liberty was not entirely absent, and the two half-truths do tend to point towards at least one full truth.

NEGLECTED CAUSE

From the beginning of their career as kisan organisers in Bihar, Sahajanand and his friends displayed little inclination for taking up the cause of the landless agricultural labourers or 'khet mazdoors', many of whom also happened to be the dalits of agrarian society. When the movement began to spread in Bihar they were not certain if the dalit khet mazdoors could be included in the category of 'grihastha' kisans, and whether, following the basic 'land to the tiller' slogan, it would be practicable to demand land for the dalit khet mazdoors, by flouting the age-old ascriptive notion against it. Their confusion was further reflected in the BPKS Manifesto of 1936 demanding 'gainful employment' for the landless, but not land as such, and the way they felt that the khet mazdoors' misery could not be rooted out "till imperialism is replaced by a national state", or, as Rahul Sankrityana was reported to have sceptically stated, not before "the advent of communism and revolution".

Sahajanand and the BPKS did, nevertheless, try uncertainly to initiate a landless labourers' agitation in September 1937 in the eastern part of Patna district among the musahars (dalits) of Tirhut over the demand for increased wages and improved conditions of work. The attempt, coinciding

with the activities of a Congress-inspired and Jagjivan Ram-led, short-lived Khetihar Sangh, raised both casteist alarm and class hostility among the substantial peasants - those who usually employed agricultural labour. It eventually led to clashes between the musahars and their employers in the first half of 1938, resulting in violence and bloodshed, and enabling the authorities to crush it in the name of maintaining law and order. The set back so stunned the BPKS that it did not make another worthwhile attempt at organising the agitation of the khet mazdoors. Although its leaders continued to talk about the demands of the 'rural proletariat', their main effort throughout 1938-41 was somehow to harmonise the relations between the agricultural labourers and their kisan employers. They, in fact, tried hard to explain the 'involuntary' exploitation of the khet mazdoors by the landholders in terms of the latter's having little alternative, under the strain of rack-renting, but to minimise the cost of cultivation even at the expense of the wage-earners. They also appealed to the substantial peasants to consider the khet mazdoors as their own 'kith and kin' who should be given their due (Swami Sahajanand's presidential address, 3rd session of the All India Kisan Sabha, Comilla, May 13, 1938), and exhorted both the categories to appreciate "the great and growing need for their united front" (Resolution on Agricultural Labour, 4th Session of the All India Kisan Sabha, Gaya, April 9-10, 1939).

All this, and the fact that the BPKS neither made any serious effort to rally the khet mazdoors in support of the *bakasht* and the *bhowli kisans'* struggles, in spite of the khet mazdoors' spontaneous tacit support for them, nor succeeded in bringing the landless' rightful demand for land to the fore, irrespective of the feasibility of its being partially or marginally fulfilled, makes one believe that Sahajanand and his comrades had in fact neglected the cause of agricultural labourers (who included the dalits), failed to galvanise them into the movement against feudalism, and as a result left anti-feudalism in Bihar restricted to that vital extent.

It is in the backdrop of this living controversy over the contemporaneous agrarian society in Bihar that Sahajanand on *Agricultural Labour and the Rural Poor* assumes a special significance. Presented suitably (with an Introduction, an introductory statement to each chapter, a comprehensive glossary and an array of scholarly annotations) the book by Walter Hauser, who first brought the full stature of Sahajanand and the Bihar Provincial Kisan Sabha to serious academic attention in his pioneering unpublished research work of 1961, contains the original Hindi text

of Sahajanand's political tract, *Khet Mazdoor*, and its English translation. The *Khet Mazdoor*, along with other pamphlets, was written by Sahajanand during his imprisonment at Hazaribagh in the four months between June and September 1941. It remained in its manuscript form throughout, and had not been published in the Swami's life-time and thereafter. Consequently its contents, and their implications, were not known, though some people vaguely heard about it, and a few scholars even referred to it (notably Hauser himself in his unpublished work, 'The Bihar Provincial Kisan Sabha, 1929-42: A Study of an Indian Peasant Movement', University of Chicago, 1961, and Arvind N Das in *Agrarian Unrest and Socio-Economic Change in Bihar, 1900-1980*, New Delhi, 1983). This historical text lets Sahajanand speak, most impressively, indeed, for himself, and thereby, deal effectively with the charge of his lack of interest in the landless labourers' lot, and his neglect of their cause.

Sahajanand was very knowledgeable about the historical circumstances under which agricultural labourers came into existence in India, and about the reasons of their phenomenal growth in number during the colonial period. He knew intimately the kind of life they were forced to live in agrarian society, the problems they encountered, and the exploitation they had always been subjected to. As a typical radical believer in the theory of class struggle of his time, Sahajanand's attention was devoted almost entirely to the economics of agricultural labour in disregard of its caste aspect, though he neither failed to notice that "the agricultural labourers are chiefly constituted of castes which have been suppressed for centuries", nor did he shrink from defending them as "the rightful claimants" of land. Simultaneously, he pointed out that the non-dalits had also turned khet mazdoors in great numbers, especially because of the small marginal peasants' steady loss of land under colonial conditions. Consequently, Sahajanand found a kisan characteristic among the khet mazdoors, some of whom subsisted not only by wage-earning, but also by clinging desperately to tiny pieces of land, and tilling them. This "half kisan and half wage-earner" character of them, the total dependence of all others on the cultivation of land, despite their being wholly landless, and the similarity of their precarious existence with that of the small and marginal peasants, prompted Sahajanand to treat the khet mazdoors as the 'poor' kisans, and to try to mobilise them under the leadership of the Kisan Sabha.

If the Kisan Sabha was to become rallying point of the khet mazdoors along

with the poor kisans, then it must undergo a drastic change in its nature and composition. It must then defend the rural poor against the exploitation not only of the landlords and mahajans, but also of the rich peasants – not only for their freedom from the bondage, but also for getting them the minimum living wages – and turn itself essentially into a poor kisan-cum-khet mazdoor organisation. Apparently, in 1941 Sahajanand had no qualms about it ("we should have no consideration at all for the rich peasants", he said), and he recommended to the khet mazdoors two different approaches for settling their wage disputes: an uncompromisingly stern one towards the rich peasants, keeping the stakes somewhat high, and a compromisingly soft one towards the other kisans, keeping the stakes somewhat low. Together with the continuous struggle for wages, he invited the khet mazdoors to rebel against every form of bonded and forced labour, and supported their claim, along with that of those poor kisans with very little land, to a share of the landlords' excess lands, and the pool of other lands to be brought under cultivation.

Sahajanand, however, was of the opinion that the dispossessing of the landlords of their 'zirat', 'bakasht' and 'khud kasht' lands, and the distribution of these and

other lands among the khet mazdoors and the poor kisans should be undertaken only by the government. Uncharacteristically he maintained a complete silence over the issue of the 'land seizures' or the rural poor's snatching away – at the peak of anti-feudalism – the landlords' and the government's lands, and distributing them under the Kisan Sabha's overall guidance. If the 'land seizures' were not resorted to, he did not say how, and what other way, his Kisan Sabha would lead the khet mazdoors to spearhead the struggle against feudalism to its climax. Rather than elaborating on these mobilisational and agrarian revolutionary issues, Sahajanand preferred, like an economic planner (and surprisingly good one at that), to dwell on the ways and means of expanding the country's agriculture, and stepping up its total agricultural production. He showed, with the help of official reports and statistics, that the cultivable land available in 1941 was too inadequate (about three-quarters of an acre per agriculturist) to satisfy the land hunger of the kisans and the khet mazdoors. If more lands from all possible sources (including the fallow, marshy and jungle lands) were brought under cultivation, increasing the total amount to such an extent as to be possible to allot two acres per agriculturist, and the

productive capacity of land, and the production per acre, were vastly improved through full scale 'modernisation', "only then the land hunger of the kisans can be met, and only then will the agricultural labourers be able to get land".

One may, or may not accept Sahajanand's contentions in *Khet Mazdoor* as to have constituted the perfect strategy in the 1940s for mobilising the agricultural labourers in the anti-feudal struggle. One could hardly say that Sahajanand was not mindful of the landless labourers and dalits. However, the theorisations are of little importance without their being put to some practice, and similarly the intentions are scarcely useful till they are actually acted upon. The accounts of Bihar of the 1940s do not show any significant evidence of khet mazdoors' agitation, or of their coming into a certain focus in agrarian politics. They remained as unorganised after 1941 as they were before, and clearly Sahajanand's exhortations had no discernible effect on their position. Why was it so in Bihar, and not exactly so in certain other areas, and what prevented Sahajanand and his comrades from translating their ideas into actions? Had Hauser endeavoured to answer these questions at some length in his Introduction, his readers would have been benefited further.

NATIONAL INSTITUTE OF PUBLIC FINANCE AND POLICY

NEW DELHI

Requires immediately

One Environmental Economist for a period of 15 months to work on the World Resources Institute/NIPFP Project on Fiscal Policies for Sustainable Development.

Candidate should preferably have a Ph.D degree in Environmental Economics and capability of working on Taxation and Pricing of Services such as Energy, Water Supply and Solid Waste Disposal and Treatment.

Consolidated remuneration in the range of Rs. 12,000 - 15,000 p.m. will be offered depending upon qualification and experience of the candidate.

Other things being equal, candidates belonging to Scheduled Castes/Scheduled Tribes will be given preference. Applications indicating qualifications and experience should be faxed (91-11-6852548) to Secretary, National Institute of Public Finance and Policy, 18/2 Satsang Vihar Marg, Special Institutional Area (near JNU), New Delhi - 110067 or delivered within 5 days of this advertisement.

'Our Time'

History, Sovereignty and Politics

Vivek Dhareshwar

If the modernist injunction has been to make the present an object of reflection and to make ourselves the object of interrogation, the question for post-colonials is, what does it mean to be modern? This paper raises questions about how the political present theorises itself, focusing on three concepts – history, sovereignty and the subject. It is argued that deploying the problematic of community should enable us to delineate the conceptual limits of the political languages of modernity and to show the impasses of post-modernity as well as the reflexive possibilities of the political present.

IF the modernist injunction has been to make the present an object of reflection and to make ourselves the object of interrogation, then we are forced to ask with Leo Bersani: 'Is it possible not to be modern? More exactly, can we ever *experience* a time other than our own?'¹ But the question for post-colonials has been for quite some time: What does it mean to be modern? What is our own time? That question, of course, derives its force not only from the fact that modernity has been an imposition, but also from the growing apprehension that its post-colonial perpetuation may be in some profound sense an error. We are here on a conceptually precarious terrain, for it is indeed difficult to make room for that judgment and to make sense of it without losing our hold on the present. But as 'critical historians' we cannot make that judgment.

I do not invoke the expression 'critical historian' in vain. We may be able to illuminate our *fin-de-siècle* predicament by turning to Nietzsche, that other *fin-de-siècle* anti-modern, and his formulation of the dilemma confronting the 'critical historian':

The same life that needs forgetfulness sometimes needs its destruction: for should the injustice of something ever become obvious – a monopoly, a caste, a dynasty, for example – the thing deserves to fall. Its past is critically examined, the knife put to its roots, and all the 'pieties' are grimly trodden underfoot. The process is always dangerous, even for life; and the men or the times that serve life in this way, by judging and annihilating the past, are always dangerous to themselves and others. For as we are merely the resultant of previous generations, we are also the resultant of their errors, passions, and crimes; it is impossible to shake off this chain. Though we condemn the errors and think we have escaped them, we cannot escape the fact that we spring from them... It is an attempt to gain a past *a posteriori* from which we might spring, as against that from which we do spring.²

The post-colonial predicament is that we have been mediating modernity but that mediation has always carried or secreted

within itself the sense of another historicity, which introduces almost stealthily the non-self-identity of the Indian modern. And it is this historicity which allows the critical historian of our *fin-de-siècle* to call for a critique of modernity which would at the same time be an attempt to provincialise Europe. Thus Dipesh Chakrabarty argues that,

To attempt to provincialise this 'Europe' is to see the modern as inevitably contested, to write over the given and privileged narratives of citizenship other narratives of human connections that draw sustenance from dreamed-up pasts and futures where collectivities are defined neither by the rituals of citizenship nor by the nightmare of 'tradition' that 'modernity' creates

Do these other narratives provide us with an *a posteriori* past from which we might spring or from which we might have sprung? Chakrabarty continues:

There are of course no (infra) structural sites where such dreams could lodge themselves. Yet they will recur so long as the themes of citizenship and the nation-state dominate our narratives of historical transition, for these dreams are what the modern represses in order to be

Critical history, then, attempts the 'impossible' and therefore embodies a 'politics of despair'. The project is impossible because history and the theory (the figures and categories) it uses has only one subject, 'Europe', no matter whether we are ostensibly concerned with the history of Ghana or of India.

There is a great deal of ambiguity as to what Chakrabarty means by "other narratives of human connections that draw sustenance from dreamed-up pasts and futures". The ambiguity arises mainly because Chakrabarty leaves it unclear how those 'dreamed up pasts and futures' relate to our present; and this present begins to lose its already precarious hold on us, and we, our hold on it, when he declares that the critique of modernity, the provincialisation of Europe, involves sending the categories of political

modernity back to philosophy and presumably to Europe – "in the same way as suspect coins returned to their owners in an Indian bazaar" (22). Furthermore, when he argues that "In unravelling the necessary entanglement of history – a disciplined and institutionally regulated form of collective memory – with the grand narratives of 'rights', 'citizenship', the nation state, 'public' and 'private' spheres, one cannot but problematise 'India' at the same time as one dismantles Europe" (21), it is far from clear what the implication is of problematising 'India'. If the impossible narratives of dreamed up pasts and futures float free of the present, then how does the present get problematised? On the other hand, if the task of critical history is to narrate the violence of modernity why would one need to attempt the impossible? It seems that the impossible narrative attempts to redeem the past but generates a politics of despair both because it cannot do so and because critical history is unable to explain its own implication in the present. However barren that present may be, without grasping its figurations of the *in* of our in-common, we can only think of the past as a refuge or as a loss.⁴ The present too is surely dreaming up new futures, new ways of being together, whose figurations are yet to be embodied in any theory or institutions.

Let us contrast Chakrabarty's critical history with Walter Benjamin's attempt to write the prehistory of modernity, with which it clearly has some affinity. Unlike Proust, who searched for time past in order to escape from the future and from temporality as such, Benjamin looked for "hope in the past". As Peter Szondi puts it, "the future is precisely what Benjamin seeks in the past". "The task", as Szondi notes,

is paradoxical, like the joining of hope and despair to which it gives voice. The way to the origin is, to be sure, a way backwards, but backwards into a future, which, although it has gone by in the meantime and its idea has been perverted, still holds more promise than the current image of the future.⁵

This contrast allows us to see why despair is disjoined from hope in Chakrabarty's critique of modernity. Admittedly, Benjamin too has a problem in accounting for why the 'current image of the future' is less promising than the futures past. For Benjamin, however, it is clear that the glimmers of an open, incomplete future in the past helps us break out of a paralysing historicism and thus perhaps prepares in us a receptivity to the present. In contrast, Chakrabarty's critical history, by embodying a politics of despair, by showing us why our predicament is necessarily "inescapable", will imprison us even more deeply in a historicism that is unable to open itself to any future and thus unable to determine any historical present. If we have no independent access to the real except through the interarticulation of our political concepts – the concepts of political modernity – then it is not clear what we are doing by sending them back to Europe, especially when the critique of modernity confesses its inability to provide us with any other hold on our present. And with that we lose any sense we might have had of why our modernity may be an error, for without a sense of the historicity of our present, of even the Benjaminian kind, we will have no way of seeing our present as containing futures that are not already lived out elsewhere – this elsewhere being of course Europe, the origin and telos of modernity.

The non-negotiability of political structures and idioms in India can only be accounted for by the fact that that structure and that idiom never evolved out of any existing traditions (languages, historicities). When they become part of our history, or, more accurately, when we begin to have a 'history' thanks to them, our time can only appear as 'prehistory'. When, therefore, we begin to reflect on the conditions for a critique of our modernity, it would be futile, and intellectually incoherent, to deny our 'history' as alien in order then to reach back to a different historicity as our 'impossible' history (nonmodern or premodern time, culture).⁶ But what is this present that leads us into this aporia? "What is it", as Michel Foucault has asked, "in the present that produces meaning now for philosophical reflection?"⁷ In order to determine a reflective relation to our present we must think the historicity of history itself. Here is then the paradoxical task: we need to deploy historicity against the very notion of history such that historicity is not reabsorbed by historicism. How is this possible?

It is not difficult, however, to decipher, beneath Chakrabarty's despair, the outline of another, more fascinating problematic. That is to say, beneath the despairing project of provincialising Europe, the problematic that takes shape is the problematic of community. I am proposing therefore that we raise the questions of our modernity as

a question of our time, since, as Jean-Luc Nancy expresses it so well, "The possibility of saying 'our time' and the possibility of this making sense (if it does) is given by a reciprocity between 'our' and 'time'." "Today the question of modernity presents itself as the possibility of taking up once again the question of who we are and how we are related to one another."

This paper then is designed to raise questions about how we might understand the ways in which the political present is disposed to theorise itself. What happens to some of the central concepts or the key words of our cultural and political self-understanding – such as sovereignty, citizenship, rights, democracy, secularism, the nation – when the conditions that rendered them intelligible no longer obtain? Would it be possible to map the semantic shifts wrought in them by the emergent configuration of institutions and practices? Do they retain their intelligibility today, and can they still mobilise our politico-ethical horizon? If not, what new concepts are replacing them and what are their semantic field?

Without pretending to answer these questions, I shall attempt to sketch at least the programmatic outline of an approach to them by looking at three concepts: history, sovereignty and the subject. The hypothesis is that none of these concepts can be understood without the other two. Postmodernity is a problem or a challenge for the discourse and history of sovereignty insofar as the history that we are living as well as practising is bound up with the discourse/history/institution of sovereignty. History has always been a discourse of sovereignty, and sovereignty has always been structured in the form of a subject, whether we take the latter to refer to the citizen subject or to the collectivity named by the nation.⁸ These concepts, moreover, have defined the very intelligibility of 'politics', indeed of political modernity itself.⁹ Other political concepts, too, derive their context and force from these three. The link between sovereignty, history and politics has been mutually constitutive because sovereignty has involved creating a political structure capable of defining its own past and determining its own present. Now this history/subject of sovereignty finds itself threatened above all by what one might call the 'sovereignty' of market. The play of market forces is not only indifferent to the history/subject of sovereignty, but it is also capable of reconstituting it at will, thereby denying or negating history and politics. J G A Pocock, the historian of political discourse (as he styles himself), whose formulation of the issue seems to me to capture the theoretical and political perplexities of the issue of sovereignty, has argued that

It can be seen for the first time that the interplay of market forces is capable of abolishing whole national cultures if it does not need them any more, and whatever the outcome, the mere realisation that this is possible raises problems in human values alarming if stimulating to the critical intelligence. Should this happen? What in fact happens if it does? Among the problems arising is that of historical self-location. In what history is one living if one lives in a world where this can happen? The question is complicated and enriched if the experience begins with the demolition of the national histories which, if they did not encourage the belief that one had a share in determining one's fate, at least located fate and its mastery in an intelligible culture, tradition, and politics.¹⁰

Historical self-location becomes a problem because of the intimate link between sovereignty, the state and history. The logic of capital seems to force the state to reassert its (crumbling) sovereignty in order only to surrender it. Historiography, which was the product of the liberal state, suddenly seems to lose its focus. The crisis, however, raises even more serious questions for politics, some of which I shall try to briefly indicate. That we find the very notion of the 'political' opaque is because politics as a notion and practice derived its meaning from the unity, as it were, of history, sovereignty and the subject. So when we speak metaphorically of the sovereignty of the market that is threatening the cultural/political autonomy of the nation, we are obliquely confessing that politics has lost its meaning; and it has lost its meaning, as I just indicated, because, we no longer make sense of the triad history, sovereignty and the subject.¹¹

Although I began by considering the threat posed by the market to the history/subject of sovereignty, our interrogation of political modernity – an interrogation that seems indispensable to ascertain the possibilities of the political present – would have to show when and how the 'play of market forces' detaches itself from the discourse of sovereignty, especially since in the early modern political debates – the discourse of the market was internal to or part of the discourse of sovereignty.¹² Furthermore, we would need to come to terms with the arguments which, without necessarily welcoming or positively evaluating the effects of globalisation, seem to suggest that the nation-state's (and hence of sovereignty's) decreasing significance opens up other political possibilities which may be able to avoid some of the major problems that the nation-state creates or at least is unable to resolve.¹³ We need then to explore, on the one hand, the limits or possibilities of existing political concepts when confronted with new forms or structures and, on the other, whether any new political

concepts are being generated in the process. It may be that the discourse of sovereignty is not tied to any given conception of the nation-state, and that the debate about the appropriate form of the state is internal to the historical dialogue that constitutes the discourse of sovereignty.

The career of these concepts in non-European contexts creates impasses or aporias that are yet to be resolved. What is the logic of history/sovereignty in India (and in postcolonial places in general)? It is on this site that both their constitutive force and their present crisis can be made perspicuous, and questions asked about the reflexive possibilities of the political present.

The history/subject of Indian sovereignty has been constituted as a "biography of the nation-state",¹⁶ and this history, in fashioning itself as a history of sovereignty, has had to exclude and delegitimise other idioms and agencies. It would be instructive here to look at the problem of secularism. There is an obvious sense in which it is culturally alien (imposed, like most of our political institutions, by the British and deriving its authority in large measure because of that), and it is also what the nationalists – more precisely Nehru and Nehruvians – saw as a rational normative choice which a multi-religious sovereign state would do well to make. But it has been unclear what it means for Indians to share its history as henceforth part of theirs or what history it enjoins Indians to determine. For this question could not arise as long as the authority and value of political concepts embodied in the post-colonial state (taken over intact from the British) legitimised only one history. Only when that authority began to be undermined and challenged by very different processes did questions long suppressed come to the surface.

To put it very schematically, the state's espousal of secularism entailed, paradoxically, an active attempt on its part to secularise what it took to be religious institutions (Hindu/Muslim/Christian). This was far from being a benign process.¹⁷ The Hindu right (the emergence of Hindu as a political identity is a fairly recent phenomenon) now claims that the state, as well as the liberal/left intelligentsia, is favouring the minorities ('appeasement of the minorities' in their political rhetoric) by allowing them to have their own 'personal law'. So they claim that the state is 'pseudo-secular' because far from being neutral between religions it intervenes in Hindu institutions but protects the Muslims. If secularism as a doctrine or policy as well as a cultural ideal has not only failed but has in fact created a space which the Hindu right is mobilising to take over in order to marginalise (to put it euphemistically) an already marginalised community, then we seem to need something more, or, at any rate, something other, than

mere reiteration of secularism (which most leftists and liberals end up doing). Secularism as a doctrine of toleration is closely linked to the principle of sovereignty (and the juridical power associated with it). Rather than argue that the only consistent, viable position for Muslims is to demand, and for the state to grant, sovereignty in 'cultural' matters, I would argue that we must work toward a political space from which we can question the very principle of sovereignty as embodied in the state. This questioning would have to begin with an attempt to redefine citizenship, and in the process explore the limitations of the politics of rights. This questioning may end up deconstructing these notions, not merely or primarily on grounds of their Eurocentricity, but because they no longer tell us the terms of our practical and passionate relationship to one another¹⁸ because they no longer embody a politics.

The state functions by naturalising the classes and groups of civil society. When these groups and classes form or mediate representations of themselves through the state, antagonisms and dislocations of the social emerge in the open. What we have called 'political identity' emerges as the articulation of these antagonisms. Thus the 'Hindu' as a political identity is irreducible to the interests of any one group in civil society and to the cultural/religious entity called Hindu. The attempted new equation, Indian citizen=Hindu, is a result of the attempt to compensate for the excess of universality; it is not primarily intended to appropriate the state or to make it religious. In fact, one could argue the radical proposition that religion is not the issue at all, and therefore the focus on 'secularism' is misplaced – yet another instance of left/liberal literalism that negates politics. The citizen's becoming a subject depends on the state – and, as we know, in the post-colonial context the state is the most powerful modernising agent – insofar as the abstract, universal slot (whose ideality is given as interior to itself) needs the state to guarantee it as such. It would be possible to show, following Foucault, that governmentality in the colonial/post-colonial context deploys both sovereignty and discipline to institute modernity, including the institutions and practices of political modernity, it also in the same process inscribes or reassigns inequality as difference (usually onto those it constitutes as not-yet-citizens – women, 'minorities', 'scheduled castes/tribes').¹⁹ Can we then invoke sovereignty to defend difference?

The Muslim and the dalit are in a similar position in relation to the state: their identity is too particular and too excessive. In imposing an identity on them, the state seeks in effect to circumvent their agency. Their identities become excessive because they are blocked from the space of citizenship.

The political identity 'Hindu', on the other hand, emerges as a reaction to the excess of universality. What the 'Hindu' envies/hates in the Muslim is precisely the predicament of the Muslim, namely, the Muslim's confinement to his/her identity (the excess of it).²¹ If we now readily accept that there is violence in the denial of identity, we must begin to understand the conditions in which the affirmation of identity can turn into an imposition of identity (as well as an incitement to identity) and thus lead to a kind of violence not dissimilar to that involved in the denial of identity.

Is there a sense of historicity and agency that does not obey the structure of sovereignty? This formulation imposes itself on us; however, one must resist turning it into yet another expression, or an inversion, of the sovereignty principle. Rather, what we should look for is the process of imbrication whereby the principle of sovereignty assimilates – or tries to, at any rate – structures and practices that do not conform to the logic of sovereignty, for example, caste, whatever kind of an entity or a practice we take it to be. A theory of caste-practice would have to converge on the attempt to explore a politics that interrupts the logic of sovereignty.

When scholars and political commentators look at caste practices, they note the irony of various caste-groups declaring themselves 'backward' and demanding that their caste too be included in the list of castes deserving of reservation. There is nothing at all ironical in this if we reverse our perspective and see them as redefining citizenship and reaffirming the singularity of their identity. Despite the regimentation of caste by the state, it remains a fuzzy concept. The redrawing produces a different kind of thickness. The task for a political theory is not simply to identify or clarify or criticise or justify their statist goals nor describe the state's view of them, but to reflexively explore the possibilities opened up by the enormous fluidity of caste practices and identities. It can also go some way toward resisting and recasting classifications such as 'scheduled castes and tribes' and 'Backward Castes', so that a new vocabulary – which embodies the new possibilities – may come to replace the statist bureaucratic categories: so that identities are open to political agonism, and do not merely remain state-mediated. "How", Balibar has rightly asked, 'can we inscribe the programme and the very name of equality in singularities?'²² The present, then, requires redescription—which is not to suggest that mere redescription will somehow take care of the problem, but argue that the attempt at redescription requires rethinking history, subject and sovereignty. The futurity, understood as the reflexive possibilities of the present, depends perhaps

on the excessive figures generated by the citizen-becoming-a-subject, rather than on the universalisation of the citizen subject, for the latter's impossible sovereignty forever requires a supplement or a doubling.²³

The larger problem here involves, of course, understanding what modernity has meant in India and how the state as a modernising agency *par excellence* has functioned and with what consequences. Let me present a highly simplified – but not, I hope, simplistic – spectrum of positions with which we would need to contend.

(1) Modernisers and Postmodernisers: The first position would argue that despite all the problems encountered and even created by modernity, carrying through the project of modernity (politically, economically) is still the best choice. It would see the recent attempt by the state to 'liberalise' the economy as a betrayal of the goals of modernity, as a surrender of sovereignty. In its left-liberal version (dominant until recently) it organised its politics around the agency of the state and predicated the identity of the citizen subject on the rationality (and hence modernity) of that agency and its ideology of sovereignty. Politically, however, this position has lost its persuasive power, and it would be important for us to analyse the loss of hegemony of this position. Where did it derive its authority from and how does it respond to its loss of authority? What changes can one envisage in its idiom? What new 'moves' is it capable of? The postmodernisers, those who wish the state to follow globalisation, would argue that politics will take care of itself if economy is freed; their vision is inspired by the International Monetary Fund model of civil society. That is to say, in this neo-liberal vision, only the agency of the market is recognised as rational, and unlike its earlier incarnations, it presents market itself as its own justification. However, as an idiom it is yet to articulate itself fully and in the Indian context at least its constituency, the globalising middle class seeking access to the cosmopolis of communication (apart of course from the state itself), is yet to establish its dominant motifs politically.

(2) The more radical position, admittedly a minority position held by a section of the intelligentsia, but which may reflect a fairly pervasively, if incoherently, felt experience, would argue for a rejection of modernity itself. Or, at least, it would see modernity itself as the problem; although many are tempted by this position, its articulation as a viable political position faces insurmountable difficulties. The claim that modernity has been an imposition of something alien, that we non-westerners would do well to evolve our 'own' institutions and practices, runs into difficulties when it tries to narrate and make sense of the history of, say, the last 200 years. Insofar as its

critique of modernity seems to involve a rejection of modernity (and, consequently, of the present) this position seems headed toward an untenable nativism. Nonetheless it does open up some very serious questions about what history we are living in and how we characterise our political present.²⁴

(3) There might conceivably be another position (opened up to a large extent by Partha Chatterjee) which, taking its bearing from the insights as well as the impasses of the previous positions, would argue that what needs to be rejected is perhaps not modernity but the modernist understanding or interpretation of modernity.²⁵ This position would start with an acknowledgement that there is something like a 'suspension' of history – the inability of the history that has constituted our present to 'go forward', as it were – in order to begin an interrogation of the different idioms as well as a dialogue between different historicities.²⁶ The history that is under suspension – for various heterogeneous reasons – is the history that has constituted itself or has been written as the "biography of the nation-state". If this history/subject of sovereignty is in crisis now, does it mean that our present is post-historical and post-political, given over entirely to the market and its sovereignty? Or can we speak of other political possibilities contained in different historicities and agencies that have a chance, a future, precisely because of that impasse?²⁷

Unlike the position above, this position would not reject political concepts simply on the grounds that they are western. Instead it tries to ask, conceptually and historically, why those concepts/institutions have turned out to be inadequate, troublesome and even disempowering – not only for minorities but for what the state calls 'scheduled castes and tribes'. And it hopes this questioning will generate a more complex sense of the historicity of our present. But would that help us ascertain the political possibilities of the present? This question forces us to address difficult issues – which are both philosophical and historical – such as how political concepts relate to cultural practice, under what conditions they change; how new political concepts come into being (if they do). If culture is supposed to tell us who we are, politics, one imagines, has the task of telling us what we are and how we are related and should relate to others. The problem with the sovereignty model in India (as elsewhere) has been that it both sutures and reproduces the split between culture and politics.

Partha Chatterjee has formulated the problem elegantly and forcefully:

Here lies the root of our post-colonial misery: not in our inability to think new forms of the modern community but in our surrender to the old forms of the modern state. If the nation is an imagined community and if

nations must also take the form of states, then our theoretical language must allow us to talk about community and state at the same time. I do not think our theoretical language allows us to do this.²⁸

If Foucault sees sovereignty (and the juridical representation of power associated with it) as superseded by governmentality, and surviving, in conjunction with disciplinary power, as an instrument of governmentality, and if for Pocock modernity is defined by the discourse of sovereignty, which renders possible history as a meaningful structure and politics as an activity that defines and redefines that structure, Chatterjee's work opens up a way of mapping the colonial articulation and post-colonial interrogation of disciplinary power, governmentality and the discourse of sovereignty.²⁹

Chatterjee argues that Indian nationalism first established its sovereignty in the cultural domain constituting it as the 'inner' and 'spiritual' (family, education), where it began to carry out the process of 'normalisation'. Its political articulation, however, never challenged the ideology or the political form of the colonial state. Subsequently, of course, this state was appropriated and 'domesticated'. Yet the imagining of the nation-state remained within the logic of sovereignty as the latter was deployed as an instrument of governmentality, often in conjunction with disciplinary power. What remains suppressed or denied, both in western theories and in Indian nationalism, is the possibility of articulating the nation by acknowledging the claims of community itself. The thinking of community remains, and will remain, impoverished because our imaginary and our institutions have so far found no place for it. So, Chatterjee's provocative hypothesis is that "an investigation into the idea of the nation, by uncovering a necessary contradiction between capital and community, is likely to lead us to a fundamental critique of modernity from within itself".³⁰

The crucial question, then, is how the 'who' (of 'culture') and 'what' (of 'politics') relate to each other. This question lies at the heart of the concept of the citizen subject. What is involved in the translation of political idioms? How to characterise the resulting imbrications? Are there any 'prerequisites of citizenship' – economic, cultural, or gender? Are the problems and antagonisms generated in the process of putting citizenship (and other related concepts such as rights) into practice contingent by-products, or are they internal to it? The post-modern condition has perhaps only precipitated a debate that was long overdue. That debate would have to address the question: what are the ways in which the concept of 'history' is being, should be and can be formulated with regard to the necessities and reflexive possibilities

of the modern Indian state? Are there conceptions of historicity, community and political agency that are not tied to the subject-structure of sovereignty and its conception of history and politics? In other words, what are the possibilities and dilemmas of post-modernity in India?

The problem of 'historical self-location', with which I started, intersects with the problem of inventing a language (or languages) which would help us break out of the shackles of the modern state and the form of politics that it imposes. It is at the intersection of these problems, I have tried to suggest, that the concept of community re-emerges as the great unthought of our political and philosophical theory.¹¹ If we now combine Chatterjee's hypothesis with my suggestion that we need to think the historicity of history itself, there opens up a possibility, but no more than a possibility, of thinking about the nation differently.

I began by asking in what sense we could call modernity an error, an error perhaps that we ourselves are. Asking how one could arrive at this difficult, perhaps impossible, judgment, involves asking questions about our time, about the historicity of the present. What is our time, then? "Our time", says Jean-Luc Nancy, "is the time, or a time... of the *suspense* or *suspension* of history – in the sense both of a certain rhythm and of uneasy expectation" [emphasis in original].¹² What is suspended is history as the self-presentation of a subject or an idea. This is not of course the end of history much in the news recently, or, rather, it is the end of precisely that history whose end has been announced. For that history was/is the history of "historicism – with or without teleology. As Nancy puts it, 'historicism in general is the way of thinking that *presupposes* that history has always already begun, and that therefore it always merely continues. Historicism presupposes history, instead of taking it as what shall be thought" [emphasis in original].¹³ That also means that historicism cannot think the present – our time – as inaugural, as a promise that is not predetermined by an origin or a telos. History, finite history (and, as Nancy says, there is no other kind) is always the history of community, of a being-in-common; the in-common, however, cannot be thought of as substantiality, as substance or subject, despite the fact that the 'in' of in-common is always figured, as fraternity, as nation, as proletariat. Community is not to be thought of as a subject or a supra-individual. Fusion, immanence or oneness is the death of community, for "[c]ommunity is, in a sense, resistance itself: namely, resistance to immanence".¹⁴ Nancy's ontology (for the lack of a better term) of community attempts to describe it as finitude of singularities. But this singularity is not produced or extracted;

it takes place in the unworking of being-together. Or as Nancy puts it, "[i]n myth, community was proclaimed: in the interrupted myth, community turns out to be what Blanchot has named 'the unavowable community'" which both promises and forbids articulation. But is it unavowable because, like Nietzsche's *a posteriori* past, one can only 'live it in what makes it contemporary to a past which it has never been possible to live'?"¹⁵

We need then a critique of modernity which involves neither a denial of the history of political modernity that has produced the 'error' we ourselves are, nor an acceptance of that history (the end of history) that denies the *eventuality*, the noncontemporaneous historicity of our present – neither a denial of the hegemonic work of nationalist modernity that has produced 'our' national identity, nor a ratification of that identity as the sovereign embodiment of community. As Nancy argues,

[C]ommunity cannot arise from the domain of work

One does not produce it, one experiences or one is constituted by it as the experience of finitude. Community understood as a work or through its works would presuppose that the common being, as such, be objectifiable and producible (in sites, persons, buildings, discourse, institutions, symbols in short, in subjects).¹⁶

The task is to formulate a conception of historicity that allows us to think the history of community, but community thought without and against the subject-structure of sovereignty, to think our singularity – contingent, without origin or end – rather than our sovereignty – which cannot do without origin or end because it so centrally involves property (real as well imaginary, legal as well as cultural). So we need to ask, what sort of a community is the nation? What do we understand by community and its relation to politics? Is the idea of the nation exhausted by nationalism – cultural or political, and by the claim of the nation-state to embody it? There is a sense in which nationalism is always cultural nationalism. If one wants to theorise the nation without recourse to nationalism (or to the nation-state), how does one get around the fact that it is always the 'culture' of the people that provides the ground for political claims (sovereignty, autonomy, etc), that ultimately, nationalism – the enjoyment (*jouissance*) of the nation-thing, as Žižek would put it, subtends all claims regarding the nation (including, and especially, the elementary and elemental claim implicit in the 'magical' pronouns 'my' or 'our')?¹⁷ The only way out lies in constantly interrogating the relationship between work (nationalism, nation-state) and unworking (the nation as community).

A culture, as Derrida reminds us, is never identical to itself.¹⁸ It is this self-difference

of a culture – unstable, precarious, yet always present – that allows for the possibility of a different signification than a total and remainderless identification with the figures generated by the 'work' of modernity or the nation. The figuration of the community has produced a singularity – a shared identity that we call national identity – but this figuration has tended to deny or disavow its own non-foundation, its finitude. Because nationalism is always an attempt to dissimulate this non-foundation or finitude, it always requires an excess or a *supplement* of nationalism.¹⁹ Nonetheless, can we not think of the nation as the interruption of myth?

Thus once myth is interrupted, writing recounts our history to us again. But it is no longer a narrative – neither grand nor small – but rather an offering: a history is offered to us. Which is to say that an event – an advent – is proposed to us, without its unfolding being imposed on us. What is offered to us is that community is coming about, or rather, that something is happening to us in common – neither an origin nor an end: something in common.²⁰

Once the myth is interrupted – including the myth of history as sense, direction, telos – the principles, questions and formulations that had organised the myth are prohibited; but this prohibition is "a decision without justification."²¹ Perhaps no justification can be offered without restoring the myth, without the fiction of another foundation.

'Thus', to put it in the words of Blanchot,

one will discover that it [the unavowable community] also carries an exacting political meaning and that it does not permit us to lose interest in the present time which, by opening unknown spaces of freedom, makes us responsible for new relationships, always threatened, always hoped for, between what we call work, *oeuvre*, and what we call unworking, *desoeuvrement*.²²

When we initiate a critique of nationalist modernity, the basis for it cannot be found in residual practices – the practices that are (as we used to say) left behind by modernity or those that somehow survive into modernity – but to what is engendered by the process of normalisation of modernity, namely, the figures of unworking. There is a sense in which those who claim to critique modernity cannot avoid repeating the Tonniesian/Weberian story of increasing thinness of practices, concepts. Bernard Williams, for example, repeated that story in his theory of thick and thin ethical concepts, our ethical modernity being characterised by thin ethical concepts such as ought, good, right and by the disintegration of thick concepts such as shame, treachery, courage. Chatterjee too shows a certain weakness for the myth that the pre-modern was thick and the modern is thin when he implies a contrast

between the polysemy of pre-colonial 'jati' and its regimentation into caste by colonial modernity.⁴⁴ His idea of imbrication of idioms, however, militates against that interpretation, and has the potential for providing a different way of interrogating modernity. Our modernity too has produced thick concepts, produces them all the time; but we will not find them if we look to the self-understanding or self-justification of modernity. That is to say, we will not find them if we look to the 'work' of modernity, but to the figures of its unworking, the forms of community that come into being in the very unworking of modernity. Therefore, unless one is committed to a certain historicism, there is no reason to deny that modernity might be creating another polysemy, around other concepts and practices. Thus, for example, one could look at post-Mandal India, in the thick to thin version, as the result of that thinning process; or one could, without committing oneself to any teleology, look at it as creating, or at least making possible, the creation of other polysemic concepts/practices.

I have suggested that we must interrogate and reject the modernist interpretation or self-understanding of modernity, but it is an absurd project – historically and conceptually – to reject modernity itself. 'We' are modern. The state and sovereignty are as much an Indian thing as, say, caste. Therefore, one could argue that a critique of modernity that entails its rejection can only be an evasion of the present. It cannot be a critique of the present. Thus the question of community is a question *par excellence* of modernity. If we take the critique of modernity to imply a rejection of it, then community can only mean a residual, traditional thing, and, consequently, the politics based on that notion would have to be a rescue or recovery act – to recover a language, reclaim a tradition (even a resistance tradition). It would be a redemption project. In contrast, we take community as what 'happens' to us now and politics as the exploration of the new space of freedom opened up by the relationship between 'work' and 'unworking'. One leads to a protective, redemptive politics; the other makes possible new experiences of 'our time'.

I have argued, rather schematically and programmatically, that deploying the problematic of community should enable us to delineate the authority as well as the conceptual limits of the political languages of modernity; to show the impasses of post-modernity as well as the reflexive possibilities of the political present. The aim would be to generate a political theory for the present whose idiom will derive its layered reflexivity from a reinterpreted conceptual history. The question for that political theory would be: if political agency has been theorised in the form of a subject (rights of the citizen,

sovereignty of the subject), can we now legitimately ask: *who* comes after the subject and *what* replaces the discourse/history of sovereignty?

Notes

[Tejaswini Niranjana helped me to conceptualise the arguments. Conversations over the last year with Partha Chatterjee stimulated me to engage with the problems of the nation and secularism. I am indebted to J G A Pocock for his generous and illuminating correspondence that set me thinking on some of the issues discussed here. I am, of course, responsible for the position, such as it is, advanced here.]

¹ Leo Bersani, 'Boundaries of Time and Being: Benjamin, Baudelaire, Nietzsche' in *The Culture of Redemption*, Cambridge, 1990, p 47

² Friedrich Nietzsche, *The Use and Abuse of History*, Indianapolis, 1957, p 21

³ Dipesh Chakrabarty, 'Postcoloniality and the Artifice of History. Who Speaks for 'Indian' Pasts', *Representations*, 37, Winter 1992, p 23. Subsequent references to this text will be given in the text.

⁴ What is puzzling in this courageous, intensely personal and polemical intervention is its elision of the present. When Chakrabarty does address in passing the present while talking about "the bourgeois legal fiction of citizenship", he employs its "performance" in India as "farce" (a very Eurocentric judgment repeatedly endorsed by the Indian elite). And yet he says that he recognises how the language or fiction of rights has "in many circumstances empowered marginal groups". It is because of that elision, the non-acknowledgement of the implication of his own discourse in the present, that Chakrabarty is forced into a series of defensive pre-emptive denials of nativism, nostalgia, antimodernity, etc. Commenting on Gandhi's critique of Europe, Chakrabarty says that, it "is compromised on many points by his nationalism. ..." (8) What would be an uncompromised or uncompromising critique of Europe? One could argue that only that position is uncompromised which has never felt or which no longer feels the need to talk about or tangle with 'Europe'. Chakrabarty's own project, it seems to me, repeats the founding problematic of nationalism, namely, the split between culture and politics – 'our culture', 'their politics'. To redeem our culture, not only from their political categories but even from the figures and morphologies of their theory or historiography – isn't this a radicalised nationalism? Quite apart from the conceptual difficulties of that project, I find it incoherent because (and one does not have to be a wheel-of-progress Marxist to say this!) it seems to express a wish that we were someone else and someplace else.

My claim is that politically relevant, and intellectually challenging, questions about even Eurocentricity are to be encountered in our relationship to the post-colonial present. Without the thematisation of that relationship, the attempt to provincialise Europe may, paradoxically, simply trap us

in that province. To ask the question of what Eurocentricity means, and what its rejection means, in relation to our present, is to refuse to enter the battle against a phantasmatic west (that seems to present itself as the site of one's original alienation and therefore presumably as the object of post-colonial *resentiment*.) An acknowledgement of what we are and where we are seems necessary for exploring the reflexive possibilities of the present. Instead of focusing on Europe as an object, reality or hyper-reality, let's start by asking questions about our present. My point then is not that we should lower the stakes involved in a critique of Eurocentricism, it is rather that we cannot make sense of the stakes as Chakrabarty presents them.

⁵ Peter Szondi, 'Hope in the Past: On Walter Benjamin' in *On Textual Understanding and Other Essays*, translated by Harvey Mendelsohn, Minneapolis, 1986, p 156

⁶ Caught between an unimaginable future and an unredeemable past, it would seem therefore that the post-colonial is left with an unrepresentable present. And if Europe is coextensive with modernity itself, if Europe has universalised itself, it may be that once again history has cheated the post-colonial – or he/she has been cheated of history. Just when it seemed possible to inaugurate a post-colonial interrogation of modernity – the self-inauguration of the (western) subject, it turns out that that project has been rendered otiose either because modernity has already realised itself (history, and with it politics, has come to an end), or because its realisation itself testifies to its failure (history and politics have lost their intelligibility). The proliferation of 'post's – post-national, post-political, post-history – attests to a condition for which we may as well accept the term 'post-modern'.

⁷ Michel Foucault, 'The Art of Telling the Truth' in *Michel Foucault: Politics, Philosophy, Culture*, Lawrence D Kritzman (ed), translated by Alan Sheridan and others, New York, 1988, p 87.

⁸ Jean-Luc Nancy, 'Finite History' in *The Birth to Presence*, translated by Brian Holmes and others, Stanford, 1993, p 151.

⁹ The project I have in mind is similar to, say, Partha Chatterjee's project (*The Nation and its Fragments: Colonial and Post-colonial Histories*, Princeton, 1993) of fashioning a language that "must allow us to talk about community and the state at the same time" (p 11) in order "to claim for us, the once colonised, our freedom of imagination" (p 12); or to Foucault's proposal for a critical ontology of ourselves which "will separate out, from the contingency that has made us what we are, the possibility of no longer being, doing or, thinking what we are, do, or think" ('What is Enlightenment' in *The Foucault Reader*, Paul Rabinow (ed), New York, 1984, p 46); or to Bernard Williams' attempt (*Shame and Necessity*, Berkeley, 1993) to recover a sense of agency and responsibility that was present in antiquity, which persists despite the modern moralised notions of agency, and can perhaps be used to tell "us not just who we are, but who we are not" (p 20).

- 10 See Etienne Balibar, 'Citizen Subject' in *Who Comes After the Subject?*, Eduardo Cadava, Peter Connor, Jean-Luc Nancy (eds), London, 1992; and 'Rights of Man', and 'Rights of Citizen' The Modern Dialectic of Freedom and Equality' in *Masses, Classes and Ideas*, translated by James Swenson, London, 1994. These two important essays of Balibar show how the antinomies of the modern concept of the subject arise from the problematic of what he calls the citizens becoming-a-subject (*devenir-sujet*). My own discussion of citizen subject and sovereignty is indebted to the insights of these two essays. On the subject-structure of the historicist notion of history itself, see Nancy, 'Finite History', p. 148. For an illuminating discussion of the links, historical and conceptual, between property, sovereignty and history and between property and citizenship, see J G A Pocock, 'Tangata Whenua and Enlightenment Anthropology' *New Zealand Journal of History* 26(1), April 1992, pp. 28-53, and 'The Ideals of Citizenship since Classical Times' *Queen's Quarterly* 99(1), Spring 1992, pp. 33-55.
- 11 J G A Pocock, 'History and Sovereignty: Response to Europeanisation in Two British Cultures', *Journal of British Studies*, October 31, 1992, pp. 358-89, see also his 'Deconstructing Europe', *London Review of Books*, December 19, 1991, pp. 6-10.
- 12 Pocock, 'History and Sovereignty', pp. 361-62.
- 13 My discussion so far has I hope, set the context for understanding Pocock's suggestion (this I take it, is the 'stimulating' part of what he otherwise regards as an 'alarming' state of affairs) that "[t]he classic questions of early modern politics [citizen-subject, sovereignty, rights, and so on] may be renewed under post-modern conditions." ('History and Sovereignty', p. 368). This is, then, the sense in which 'our' situation has affinities with the early modern situation. Fundamentally, we too are required to institute or reinstitute the political, or accept its demise and draw the consequences.
- 14 As is evident from the work of the Cambridge school. See J G A Pocock, *Virtue, Commerce and History*, Cambridge, 1985, and 'A Discourse of Sovereignty: Observations on the Work in Progress' in *Political Discourse in Early Modern Britain*, Nicholas Phillipson and Quentin Skinner (eds), Cambridge, 1993, James Tully, *An Approach to Political Philosophy: Locke in Contexts*, Cambridge, 1993, Richard Tuck, *Philosophy and Government: 1572-1651*, Cambridge, 1993. See also Albert O Hirschman *Passions and Interests: Political Arguments for Capitalism before Its Triumph*, Princeton, 1977. There is no work, to my knowledge, that attempts to relate the contemporary relationship between the discourse of market, property and capital to political discourses. In his suggestive essay ('What is a Politics of the Rights of Man?' in *Masses, Classes, Ideas*), Balibar has underlined the political importance of theorising the contemporary forms of property for an understanding, in particular, of new forms of inequality and difference.
- 15 This is not the place to discuss the complicated and fascinating arguments for post-national identities or social forms. See Arjun Appadurai, 'Patriotism and its Futures', *Public Culture* 5(3), Spring 1993, pp. 411-30; Manuel Castells, 'European Cities, the Informational Society, and the Global Economy', *New Left Review* 204, March/April 1994, pp. 18-32; Michael J Shapiro, 'Moral Geographies and the Ethics of Post-sovereignty', *Public Culture* 6(3), Spring 1994, pp. 479-502; Yael Tamir, *Liberal Nationalism*, Princeton, 1993; William E Connolly, *Identity and Difference: Democratic Negotiations of Political Paradox*, Ithaca, 1991.
- 16 Gyanendra Pandey, 'In Defence of the Fragment: Writing about Hindu-Muslim Riots in India', *Representations*, 37, Winter pp. 27-55.
- 17 Partha Chatterjee, 'Secularism and Toleration', *Economic and Political Weekly*, Vol XXVII, July 9, 1993, pp. 1768-83.
- 18 The phrase is from Roberto Unger, *Social Theory: Its Situation and Its Task*, Cambridge, 1987.
- 19 It is hard to improve upon Marx's classic statement of the issue: "The state in its own way abolishes distinctions based on birth, rank, education and occupation. When it proclaims that every member of the people is an equal participant in popular sovereignty regardless of these distinctions, when it treats all those elements which go to make up the actual life of the people from the standpoint of the state. Nevertheless the state allows private property, education and occupation to act and assert their particular nature in their way, i.e. as private property, as education and as occupation. Far from abolishing these factual distinctions, the state presupposes them in order to exist, it only experiences itself as political state and asserts its universality in opposition to these elements." Karl Marx, 'On the Jewish Question' in *Karl Marx: Early Writings*, translated by Rodney Livingstone and Gregor Benton, Harmondsworth, 1975, p. 219.
- 20 Michel Foucault, 'Governmentality' in *Foucault Effect: Studies in Governmentality*, Graham Burchell, Colin Gordon and Peter Miller (eds), Chicago, 1992. However plausible this must for the time being at least remain a hypothesis.
- 21 Why this reaction now to the excess of universality? A hypothesis could be that the citizen feels deprived of those factual distinctions or they are threatened. The consumer-citizen, who emerged in the 80s, and those who identified with or aspired to that identity, feels a dislocation that threatens his very identity. In this situation, the Muslim appears as the person most secure in his identity, who is stealing our pleasure - our nation-thing, as Slavoj Žižek puts it. See his *Tarrying with the Negative: Kant, Hegel, and the Critique of Ideology*, Durham, 1993, Ch. 6.
- 22 Balibar, 'Rights of Man' and 'Rights of Citizen' The Modern Dialectic of Freedom and Equality' in *Masses, Classes, Ideas*, p. 59. He coins the neologism 'equality' to argue for their inseparability. The question of singularity marks, for Balibar, the turning point between the modern form of politics based on universality and the post-modern questions that take shape within and against it.
- 23 For an elaboration of this question, see Vivek Dhareshwar, 'Caste and the Secular Self', *Journal of Arts and Ideas* 25-26, December 1993, pp. 115-27, and Vivek Dhareshwar and R. Srivatsan, 'Rowdy-sheeters: An Essay on Subalternity and Politics', forthcoming in *Subaltern Studies IX*, Shahid Amin and Dipesh Chakrabarty (eds), New Delhi; see also Suvie Tharu and Tejaswini Niranjana, 'Problems for a Contemporary Theory of Gender', forthcoming in the same volume.
- 24 Ashis Nandy would be the most articulate representative of this position. See, among innumerable other works, his 'An Anti-Secular Manifesto', *Seminar* 314, October 1985, pp. 14-24, and 'The Politics of Secularism and the Recovery of Religious Tolerance' in *Mirrors of Violence: Communities, Riots and Survivors in South Asia*, New Delhi, 1990. Dipesh Chakrabarty's positions, too, seem to be leaning in this direction.
- 25 I take this insight from Anthony Appiah's elegant, 'The Post-colonial and the Post-modern' in *In My Father's House: Africa in the Philosophy of Culture*, New York, 1992, pp. 144-47. My interpretation of what that rejection means, however, differs from his, mainly because my interpretation of what constitutes the modernist interpretation differs from his interpretation of it as quasi-Weberian.
- 26 As Partha Chatterjee puts it, 'Now the task is to trace in their mutually conditioned historicities the specific forms that have appeared, on the one hand, in the domain defined by the hegemonic project of nationalist modernity, and on the other, in the numerous fragmented resistance to that normalising project' Partha Chatterjee, *The Nation and Its Fragments*, p. 13.
- 27 Confronted with such an impasse, it seems appropriate to argue 'that ethics, politics, and responsibility, if there are any, will only ever have begun with the experience and experiment of the *aporia*' (emphasis original), Jacques Derrida, *The Other Heading: Relections on Today's Europe*, translated by Pascale Anne Brault and Michael B Naas, Bloomington, 1992, p. 41. See also his *Aporeias*, translated by Thomas Dutoit, Stanford 1993, pp. 12-21.
- 28 Chatterjee, *The Nation and its Fragments*, p. 11.
- 29 These radically different evaluations of sovereignty issue in different conceptions of what history we are living in and what kind of subjects we are. The difficulties in making these different conceptions address each other are considerable, especially in view of Foucault's brilliant, but often idiosyncratic and inconclusive, interpretation of the triad of power, sovereignty/discipline/government. His conception of the relationship between normalising or disciplinary power and juridical or sovereign form of power as we find them in 'Two Lectures' (in *Power/Knowledge: Selected Interviews and Other Writings, 1972-1977*, Colin Gordon (ed), New York, 1980, pp. 104-108) and in *The History of Sexuality: Volume I*, (translated by Robert Hurley, New York, 1980, pp. 143-44) undergoes considerable modification with his formulation of the problematic of governmentality in 'Governmentality', in *Foucault Effect: Studies in Governmentality*, see especially pp. 102-103.

30 Chatterjee, *The Nation and Its Fragments*, p 237.

31 Since 'community' has long been a charged political trope within the political rhetoric of both the left and the right, and since the construct of India as in essence communitarian has a long history, it is just as well to emphasise the novelty of Nancy's concept of community. "Society was not built on the ruins of a community. It emerged from the disappearance or the conservation of something – tribes or empires – perhaps just as unrelated to what we call 'community' as to what we call 'society'. So that community, far from being what society has crushed or lost, is *what happens to us* – question, waiting, event, imperative – *in the wake of society*. Nothing, therefore, has been lost, and for this reason nothing is lost. We alone are lost, we upon whom the 'social bond' (relations, communication), our own invention, now descends heavily like the net of an economic, technical, political and cultural snare. Entangled in its meshes, we have wrong for ourselves the phantasms of the lost community." *The Inoperative Community*, translated by Peter Connor, Lisa Garbus, Michael Holland, and Simon Sawheny, Minneapolis, 1991, pp 11-12.

Community has, of course, figured in various languages of politics; and philosophically, the conceptualisation of politics and ethics has involved explicit or implicit use of community (Kant vs Hegel, Rawls vs Sandel). In contemporary debates liberalism and communitarianism have been regarded as embodying contrasting visions of political life. Rawlsian liberalism, for example, explicitly delimits the realm of the political; freedom is essentially freedom from politics, not merely in the sense that the Rawlsian citizen is free not to pursue politics and does not share the civic humanist aspiration to make politics the highest good, but in a more fundamental sense a well-ordered society has no need for politics or renders it superfluous. Communitarians such as Sandel, in contrast, regard politics as the highest good and argue that the liberal delimitation, if not denial, of politics would end up creating an all-encompassing bureaucratic state which in turn would disempower the community and alienate the citizen. See John Rawls, *Political Liberalism*, New York, 1993, pp 206-207; Michael Sandel, *Liberalism and the Limits of Justice*, Cambridge, 1982; and 'The Procedural Republic and the Unencumbered Self', *Political Theory* 12(1), February 1984, pp 81-96.

The question for us is: How is community conceived of here? What role is it playing? As a term in the political idiom its primary function seems to be to resist the discourse of 'right'. And the discourse of right is seen, and sees itself, as a repudiation of the claims of community, since right is always the right of an individual. In this debate the liberals tend to have the upper hand because communitarians are unable to articulate a politics without naturalising the concept of community, which makes the task of their liberal critics easy. Although communitarians, especially Sandel, have been able to articulate a powerful critique of the

'characterless' self-presupposed by liberalism, they are unable to avoid conceiving of community as subject. Community as value or a substance to be shared leads to an essentially conservative adoration of tradition and history. The discourse of right and the discourse of community confront us with an aporia: they reinvent and reinforce each other, even as they try to negate each other. If both the discourse of right and community are essentially reassuring, the attempt by Maurice Blanchot and Jean-Luc Nancy to articulate community and history as experience of finitude is profoundly disturbing. The discourse of rights culminates in the ideology of the end of history – there is nothing more to be done once the regime of right is in place. And the communitarian discourse ends up by venerating history and tradition for their own sake. History, understood as the very experience of finitude, is neither the realisation of rights nor the defence or repository of communitarian values.

32 Nancy, 'Finite History', p 144

33 Nancy, 'Finite History', p 146

34 Nancy, *The Inoperative Community*, p 35.

35 Nancy, *The Inoperative Community*, p 58.

36 Maurice Blanchot, *The Unavowable Community*, translated by Pierre Joris, New York, 1988, p 56.

37 Nancy, *The Inoperative Community*, p 31.

38 The phrase 'magical' is taken from Alasdair MacIntyre, 'The Magic in the Pronoun "My"', *Ethics* 94, pp 112-25. See also Yael Tamir, *Liberal Nationalism*, Ch 5.

39 "What is proper to a culture is not to be identical to itself. Not to not have an identity, but not to be able to say 'me' or 'we'; to be able to take the form of a subject only in the non-identity to itself or, if you prefer, only in the difference with itself (*avec soi*). There is no culture or cultural identity without this difference with itself" (emphasis in original) Jacques Derrida, *The Other Heading*, pp 9-10.

40 Balibar, *Classes, Masses and Ideas*, p 203.

41 Nancy, *The Inoperative Community*, p 69.

42 Blanchot argues that "it is not history that comes to an end with history, but certain principles, questions and formulations that will from now on be prohibited through a decision without justification, and as though with the obstinacy of a value" *The Infinite Conversation*, translated by Susan Hanson, Minneapolis, 1993, p 272.

43 Blanchot, *The Unavowable Community*, p 56

44 Bernard Williams, *Ethics and the Limits of Philosophy*, Cambridge, Massachusetts, 1985, pp 129-45. His recent work (see note 9 above) shows that a critique of the modern conception of morality, agency, responsibility, need not have recourse to this myth. The ambivalence of Chatterjee's position stems from his use of Sudipta Kaviraj's distinction, fuzzy and enumerated communities, which, while reworking the *Gemeinschaft to Gesellschaft* story, is unable to avoid the teleology and value-coding inherent in that distinction.

Educated Unemployment in Kerala

Some Socio-Economic Aspects

E T Mathew

Educated unemployment in Kerala has assumed alarming proportions in recent times. Among the causes are the opening of too many arts and science colleges and private ITIs, and a preference for salaried (especially government) employment over self-employment. Results of a sample survey show variations in average waiting time till the first regular job by type and level of education, and caste/community.

BY any reckoning the incidence of educated unemployment in Kerala is very high. The rising rate of unemployment in the state has been rightly attributed by many to the near-stagnation of the Kerala economy [Kannan 1990a, 1990b; Subrahmanian 1990]. On the basis of this logic one might argue that a much faster rate of growth of the state domestic product would largely solve the unemployment problem. In fact the examples of the most highly developed economies of Asia, namely Japan (often referred to as the 'leader of the flying geese') and the newly industrialised economies of Asia (NIEs) consisting of Hong Kong, Singapore, Republic of Korea and Taiwan-China, have demonstrated that rapid growth can go a long way toward eliminating unemployment. During 1965-80 Japan's GDP grew at an average annual rate of 6.5 per cent, which was the highest among the OECD countries [World Bank 1990: 180-81]. Roughly during the same period Japan's unemployment rate was one of the lowest among the OECD countries, varying from 1.2 per cent of the labour force in 1973 to 2 per cent in 1980 [Godfrey 1986:2]. In the case of the NIEs of east Asia, between the mid-1960s and the oil shock of 1979 the average annual growth rate of these economies ranged from 8 to 10 per cent per annum [Edgren and Muqtada 1990:16]. Since then their pace of development has slowed down, but still the growth rates continue to be impressive; the average annual growth rate of their GDPs during 1980-88 ranged from 5.7 per cent for Singapore to 9.9 per cent for the Republic of Korea [World Bank 1990: 180-81]. Not surprisingly, these economies had relatively low rates of unemployment compared to less developed countries of the region, varying from 2.9 per cent of the labour force for Singapore in 1981 to 4.5 per cent for Hong Kong in 1983 [Edgren and Muqtada 1990: 22].

It needs to be emphasised, however, that while general unemployment is largely overcome through adequate growth, educated unemployment is not solved through a higher rate of growth alone, although it is a necessary condition. In addition to achieving higher

rates of growth, the solution for educated unemployment calls for implementation of appropriate educational policies as well. In other words, the remedy for educated unemployment lies in acting on two fronts inter-related though they are – economic development and educational reform. Quantitative expansion of education must give way to qualitative improvement and reorientation. It is against this background that we attempt to highlight some socio-economic aspects of educated unemployment in Kerala.

Magnitude of Problem

All available sources indicate that educated unemployment in the state has assumed alarming proportions in recent years. We present below estimates of educated unemployment in Kerala based on the results of the 38th (1983) and 43rd (July 1987-June 1988) round surveys of the National Sample Survey Organisation (NSSO). The NSS data have been recast to include in one category all persons with secondary or higher levels of education who alone, according to currently accepted norms, are considered 'educated'.

It is seen that during the five-year period between the two rounds of the NSS, the number of educated unemployed in Kerala almost doubled itself from 3.51 lakhs to 6.34 lakhs; in relative terms, whereas 15.76 per cent of the educated were unemployed in 1983, the percentage rose to 20.98 during 1987-88. In sharp contrast, however, at the all-India level the scenario was far less discouraging; while the number of educated unemployed rose from 29.92 lakhs to 39.61 lakhs, percentage-wise the increase was less than half a per cent only (from 6.96 per cent to 7.24 per cent).

Regarding rural-urban differences, we note that both at the state and national levels educated unemployment is more acute in the rural sector. This difference may be attributed to greater employment opportunities available to the educated in the urban sector in comparison with the rural sector. The magnitudes involved, however, have been

much higher at both rural and urban levels in Kerala compared to all-India.

As for the difference between secondary and graduate (and higher) unemployment, while graduate unemployment, rural as well as urban, was markedly higher at the all-India level during the NSS 38th and 43rd rounds, no such consistent pattern is presented by Kerala. During the 38th round graduate unemployment was relatively slightly less than secondary employment in the rural sector while it was slightly higher in the urban sector. In both sectors the difference was nominal. On the other hand, during the 43rd round, the differences took a more consistent turn. Graduate unemployment was lower than secondary unemployment in both rural and urban sectors, the difference between the two being much sharper in the urban sector (8.89 per cent and 17.83 per cent, respectively).

Gender differences in educated unemployment, on the basis of the results of the 38th and 43rd rounds of the National Sample Survey, are presented in Table 2. It is seen from this table that educated unemployment among both males and females in Kerala has increased substantially between the two rounds of the National Sample Survey, and that the extent of increase of unemployment among female work seekers has been relatively much higher. Compared to Kerala, the rise in educated unemployment at the national level, whether for males or females, has been quite nominal (less than 0.5 per cent); gender differences in the extent of unemployment are also negligible. Regarding the relative impact of the levels of education on educated unemployment among males and females the results of both the 38th and 43rd round of the National Sample Survey for Kerala show that for males, unemployment among graduates and above, though definitely on the increase, is of a relatively lower magnitude compared to work seekers with secondary education only. As far as females are concerned no well-defined pattern is discernible. For them, the degree of unemployment was higher among graduate (and above) compared to those with secondary education only. However, over

the years this difference has almost disappeared as seen from the table. The major gender difference in educated unemployment in Kerala lies in the fact that while unemployment is acute among males with not more than secondary education, it is almost equally grave for female matriculate and graduate work-seekers who generally have rather strong reservations regarding the place of work.

II

Causes of Educated Unemployment

OVERSUPPLY OF ARTS AND SCIENCE GRADUATES

Relative oversupply of liberal arts and science graduates is one of the major factors contributing to educated unemployment in Kerala. The following data on enrolment amply demonstrate the phenomenal growth of the educational system of the state

During the three decades from 1960-61 to 1990-91, while enrolment at the primary stage increased by 49.8 per cent only, enrolment at the secondary stage rose by 352.9 per cent; at the university stage it increased by a hefty 836.8 per cent. Thus at each successive stage of education, enrolment has been growing at a much higher rate compared to the preceding stage. It may be noted that the enrolment figures for the university stage presented above do not include private registrations, which now constitute a major share. Data on private registrations for recent years is given below.

If we add private registrations to the regular stream, the total enrolment at the university stage during 1990-91 rises to nearly five lakhs. Obviously a larger enrolment at the university stage leads to a larger flow of graduates and postgraduates in course of time. How do we explain an oversupply of liberal arts and science graduates when there is already so much educated unemployment? A partial explanation is that such education is increasingly considered as a desirable substitute for unemployment. "The more unprofitable a given level of education becomes as a terminal point, the more demand for it increases as an intermediate stage or precondition to the next level of education" [Edwards and Todaro 1974:319]. Each worsening of the employment situation leads to an increased demand for more education at all levels.

An oversupply of liberal arts and science graduates in Kerala, however, would not have materialised unless it was facilitated by the liberal policy pursued by the state government over the years in the establishment of arts and science colleges, mostly in the private sector, as seen from Table 5.

While it took 81 years from 1866, when the first college (Maharaja's College,

Trivandrum) in Kerala was established, to 1947 when the country became independent, to open in the region now forming Kerala 22 arts and science colleges, as many as 93 colleges were added during the relatively short span of 20 years between 1948 and 1968. It is highly doubtful if there has been a similar explosion of higher education in any other part of the country. Not only has there been a proliferation of arts and science colleges, their spatial distribution also has been conducive to the growth of enrolment. Even the most hilly and sparsely populated districts such as Wayanad and Idukki have four to five colleges, while the densely populated districts in the plains such as Ernakulam have up to 24 colleges. It goes without saying that such close proximity of institutions of higher education enables guardians to avoid the extra costs of education arising from having to put their wards in hostels.

HEAVY SUBSIDISATION OF EDUCATION

We have noted that the unprecedented expansion of arts and science colleges has substantially contributed to the excess supply of graduates and postgraduates, which in turn has caused educated unemployment to

rise rapidly. However, the mere availability of a college within commutable distance does not by itself create a corresponding demand for college education, unless it is also made affordable to the lower income groups. University education in Kerala is subsidised to such an extent that private rates of return far exceed the corresponding social rates. As Blaug puts it aptly, "heavy subsidies to education can lead to favourable private signals despite unfavourable social signals" [Blaug 1973a:62]. The same warning is conveyed by Edwards and Todaro in their striking statement: "Private perception of the value of education exceeds its social value which takes account of rising unemployment" [Edwards and Todaro 1974:320]. The existing annual rates of tuition fees in Kerala, which are uniform for government and private colleges - Rs 124 for predegree, Rs 144 for degree and Rs 160 for postgraduate courses - are among the lowest in the entire country, and worse still, they have remained at these levels for almost three decades now. It is interesting to note that some of the more prestigious unaided English medium schools in the state (for example, St Thomas and Loyola in Trivandrum) currently charge annual tuition fees ranging from Rs 1500 in the KG class

TABLE 1. DISTRIBUTION OF EDUCATED UNEMPLOYED (USUAL PRINCIPAL STATUS) OF AGE 15 AND ABOVE ACCORDING TO RESIDENCE, KERALA AND ALL-INDIA

(Lakh persons)

Category	NSS 38th Round		NSS 43rd Round	
	Kerala	All-India	Kerala	All-India

to Rs 2160 in standard XII. The unjustifiably low levels of tuition fees prevalent at the university level in Kerala have led to a steady erosion of the share contributed by tuition fees towards meeting public costs of higher education. According to one estimate, tuition fees as a percentage of state government grants (recurring) to private colleges declined from 17.84 per cent in 1976-77 to 13.21 per cent in 1985-86 [Mathew 1991:65]. The High Level Committee on Education and Employment appointed by the government of Kerala in 1982 was forthright in admitting that the "incredibly low levels of fees" was responsible for "swelling the number of admission seekers for college courses" [High Level Committee Report 1984:14]. One may have to wait for the impact of the recent decision of the state government (December 1993) to raise the annual tuition fees for degree courses to Rs 400 and those for postgraduate courses to Rs 750.

IMPACT OF OVERSUPPLY OF EDUCATED ON EARNINGS

One would naturally expect earnings to fall drastically when there is so much educated unemployment as in Kerala. Indeed there has been a steady decline in the real earnings associated with different levels of education. The decline, to be precise, has taken two distinctly different forms. According to the first version, there has been a continuous upgradation of minimum educational qualifications prescribed for various posts; jobs that used to be filled by matriculates are now occupied by graduates, and jobs for which graduates used to be recruited are now offered only to postgraduates, and so on.¹ According to the second version, even as prescribed qualifications for different jobs have remained the same over the years, "the output of the educational system being in excess of that which the economy can absorb, many emerge from it seeking jobs for which they may be educationally qualified but which have been pre-empted by others with even more education" [Edwards and Todaro 1974:321]. This phenomenon is sometimes referred to as the 'cascade model' according to which the highly trained currently unemployed replace the less qualified, and the latter in turn replace people less qualified than them, and so on [Hopkins 1985:19]. One might say without any exaggeration that the cascade model fits the Kerala situation eminently. Graduates in large numbers might apply for posts for which only matriculation is prescribed as the minimum qualification (e.g., lower division clerks in all state government departments except the government secretariat, primary school teachers, etc); similarly posts for which graduation is the minimum prescribed

qualification (e.g., clerical posts in the government secretariat and in the universities, high school teachers, etc) may attract too many postgraduates. Evidently, when people are thus forced to accept jobs for which they are over-qualified it amounts to a fall in their real earnings in relation to their educational credentials.

The simple fact, however, is that earnings have not declined fast enough to reduce the incentives to acquire still more education. In spite of widespread educated unemployment in the state, wage differentials between different jobs requiring varying levels of education are substantial, and it is this differential which serves as an inducement for people to acquire more education. Of course, the probability of succeeding in getting a job which carries a higher pay is limited; but if success is achieved, the gains are substantial. The situation is, therefore, sometimes referred to as the 'urban job lottery'. One policy prescription to avoid such earnings differentials is to increase the flexibility of pay scales [Squire 1981:13]. However, as Blaug reminds us, the public sector which is a major employer in most developing countries is in the habit of 'hoarding' educated people by paying them more than their true scarcity price [Blaug 1973a:64].

III Educated Unemployment and Educational Policy

The mood that prevails among vast sections of students in Kerala as in several developing countries is to engage in a 'self-defeating search for status' which drives them to seek education without career prospects – pursuit of traditional academic subjects such as literature, philosophy, law, etc. The search for higher social status through higher education, however, is not, as often alleged, confined to communities which were denied the facilities for higher education till recently. The tendency is more deep-rooted. In fact, as rightly pointed out by the Committee on Unemployment (under the chairmanship of B Bhagavati), there has been in India an "evergrowing rush for higher education in the fond hope of raising their social status..." [Report of the Committee on Unemployment 1973:168].

Coming to the question of traditional academic subjects, it is interesting to note that in Kerala courses of study in colleges remain unchanged in terms of structure and content for long periods. For instance, over the past half century the only change in structure that has taken place at the pre-degree level (known as 'intermediate' earlier) is the addition of a fourth group, consisting of elements of accountancy and commerce, to the existing three groups. The same is broadly true of courses at the degree and

postgraduate levels. Not only that there has been no diversification of courses worth mention, the contents of the courses also, by and large, have not undergone major revisions. The academic community, especially the teachers of the affiliated colleges, are largely to be blamed for this state of affairs. As regular upgradation of the curriculum involves much more work on their part, most teachers do not welcome the idea. Even as they continue to organise agitations to better the terms and conditions of their employment, their own contribution to the modernisation of academic programmes has been minimal if not negative. Incidentally, the frequent occurrence of strikes in schools and colleges in Kerala is partly explained by the fact that under the existing system of education it is possible to pass examinations, often creditably, without regular attendance or much intellectual effort on the part of the students.

Even those economists like Harbison who have opted for the 'human resources approach

to development' in preference to the 'GNP approach', have decried the expansion of education on a 'more of the same' basis, as it is likely to result in widespread unemployment or underemployment of educated persons in most developing countries. According to him, formal education is one of the obvious ways of developing human skills, knowledge and work capacities. If formal education fails to perform this basic task, then naturally employment, and eventually development, suffers [Harbison 1973:125; Edgren 1990]. This seems to be exactly what has happened in the case of Kerala. The state has too many 'educated' people but few with the requisite skills, knowledge and work capacities. The outcome is the emergence of an unemployable 'educated class'; the wrong type of education results in refusal to work on farms, an increase in urban unemployment, subversion and collapse [Balogh 1967:92].

WHITE COLLAR HYPOTHESIS

It is commonly alleged that the job preferences of the educated in the developing countries are such that there is a premium on white collar jobs as the educated are averse to manual work and blue collar jobs. One frequently comes across this argument in the Kerala context too. The debate, however, remains inconclusive. Myrdal has referred to the negligible functional mobility of the educated as they are looking for non-manual work and are not prepared to accept work that "soils their hands" [Myrdal 1968:1124-31]. However, according to Blaug et al, this view at best is a sociological half-truth. They point out that the educated do ultimately accept lower-paid quasi-manual work; otherwise their earnings would never fall through time on they have [Blaug et al 1969:38-39, fn].

To have a meaningful discussion of the white collar hypothesis as it applies to Kerala, it is necessary to draw a distinction between job seekers whose educational qualification falls below matriculation, and those with higher qualifications. Granting that the preference for white collar jobs is rather pervasive in Kerala society, there is no evidence to suggest that the former category opts to remain unemployed for too long because of their insistence on white collar jobs. In fact there are large numbers of non-matriculates working as agricultural labourers, factory workers, head-load workers, gardeners, domestic servants, hotel and restaurant workers, vegetable and fruit vendors, etc. Further, the remuneration factor is also a key variable in this whole preference system. Wherever the remuneration is sufficiently attractive, even people somewhat educated do not hesitate to take up manual work. The classic example is that of non-matriculate literates who have migrated to

the Gulf countries, readily accepting blue collar jobs and jobs involving heavy manual work.

The situation, however, is somewhat different in the case of 'educated' job seekers. Here we confront an inter-play of economic and non-economic factors. White collar jobs in the organised sector consisting of central and state government departments and public sector undertakings, private large-scale industry, etc. are often financially more attractive than blue collar jobs. We do not, of course, rule out the possibility of a few instances where blue collar jobs account for higher emoluments, but such cases are limited and may be confined to certain pockets, both geographically and industrywise. An additional attraction of white collar jobs, especially in the public sector, are the opportunities for promotion which are almost automatic as they are in most cases seniority-based and not strictly performance-related [Blaug 1973a:64]. For instance, a matriculate police constable in Kerala, if he passes the prescribed departmental tests, can aspire to eventually rise to the position of a non-IPS superintendent of police through a process of routine promotions: a primary school teacher (SSLC+TTC) can hope to become a higher grade headmaster (Primary) in course of time. Such promotional avenues are not available to most blue collar workers in Kerala. To these advantages may be added the relative security of employment of white collar workers, especially in the public sector in which loss of job is an extremely remote possibility. Even in those cases where there is adequate ground for 'firing' of employees,

the legal loopholes involved and the lengthy processes of investigation and reporting enable such employees to continue in service. Finally there is the question of 'prestige' attached to white collar jobs. White collar jobs carry more 'respect' than blue collar or manual jobs of equal emoluments. Under such circumstances there is a marked preference for white collar jobs as evidenced by the long waiting periods job seekers are prepared to undergo. It is here that views of such writers as Myrdal, Balogh and Foster are particularly relevant. A competent self-employed plumber or electrician in Kerala may be earning on average, say Rs 3,000 to Rs 4,500 a month, but while a clerical assistant in a government office is often addressed respectfully by members of the public as 'sir', the plumber or the electrician is not. If despite mounting unemployment educated work seekers indefinitely wait for white collar jobs because of their higher pay and better career prospects, the policies of the government alone are to be blamed. If, on the other hand, in spite of the potential higher earnings work seekers avoid manual work and blue collar jobs, our tradition of paying more respect to white collar workers is to be faulted. One might say that in Kerala people are looking for jobs and not for employment!

WAGE/SALARIED EMPLOYMENT VERSUS SELF-EMPLOYMENT

What is often mistaken as a bias on the part of the educated work seekers in favour of white collar occupations is in fact a

preference for wage/salaried employment over self-employment. Among all the states in India, the level of self-employment is one of the lowest in Kerala, and this provides a plausible explanation for growing educated unemployment in the state.

The National Sample Survey Organisation (NSSO) has been collecting data, earlier in its quinquennial surveys and since 1992 in its annual surveys, on the composition of the employed as self-employed, regular employees and casual labour. The relevant data for Kerala and all-India based on the 27th and 45th round surveys are presented in Table 6. It may be noted that as estimates of usual workers based on the 27th round included both main and marginal workers, they are comparable to principal and subsidiary workers of the subsequent rounds.

On the basis of the estimates presented above, we may draw the following inferences: (1) As far as the rural sector is concerned, self-employment in Kerala lags far behind the rest of the country. The marginal increase in the proportion of self-employed persons between the two round surveys is obviously due to a shift in favour of non-farm occupations within the rural sector. (2) Within the rural sector, the preference for wage/salaried employment over self-employment is reflected in the relatively high percentage of regular employees - 6.0 per cent in the 27th round as against the all-India coverage of 4.7 per cent and 4.2 per cent in the 45th round in contrast to the national average of 3.2 per cent. (3) The limited opportunities for regular wage/salaried employment in the rural sector have, however, invariably led to increasing casualisation of labour - 17.5 per cent during 1972-73 (against the all-India average of 12.0 per cent) and 18.3 per cent during 1989-90 (against the national level of 14.2 per cent). (4) As regards developments within the urban sector of the state, it is heartening to note that the proportion of self-employed increased from 13 per cent in 1972-73 (all-India average 15.4 per cent) to 17.9 per cent in 1989-90, the highest in the country, the national average being only 14.7 per cent. The impressive growth of self-employment in the urban sector may be attributed to the expansion of the tertiary sector of the state economy in the wake of the large-scale migration of Keralites to Gulf countries [Kannan 1990]. However, we have no means of finding out what proportion of these self-employed persons were drawn from the 'educated' category. Without such information we are unable to infer that more of educated persons are opting for self-employment. In any case, from the fact that educated unemployment in Kerala has been rapidly growing, we are led to the conclusion that whatever improvement there has been in self-employment has been too inadequate

to overcome the mounting unemployment of the educated. Quite expectedly the outcome has been increasing casualisation of urban labour. The proportion of urban casual labour in Kerala in 1989-90, was one of the highest in the country; only Tamil Nadu had a higher proportion of 10.9 per cent.

The preference for government jobs, which still remain the most important form of salaried employment, is rooted in the tradition of Kerala. Each major community of Kerala has been vying with one another for its 'due share' of sarkar jobs. At one stage non-Malayali Brahmins had a virtual monopoly of government jobs in the princely Travancore state, especially the better-paid jobs. This was deeply resented by the nairs who formed the Malayali Sabha in 1880 and launched a powerful agitation which led to the Malayali Memorial of 1891.¹ The 'memorial' did not produce any immediate results, but eventually the non-Malayali Brahmins lost their commanding position in public service as they were compelled to give way to the nairs. However, once the non-Malayali Brahmins were dislodged, the nairs were determined to maintain their newly-won status. As rightly pointed out by Jeffrey, it was their exclusion from much of the government service that forced Syrian Christians to be "independent and to reinforce their traditional interests in commerce" [Jeffrey 1976:123]. Though they increasingly took to self-employment out of sheer necessity, they persisted along with the ezhavas and the Muslims in demanding, among other things, due representation in public service. It was this alliance which led to the formation of a joint (samyuktha) political congress in 1934, which finally blossomed into the Travancore State Congress in February 1938. We thus observe that apart from the built-in attractions of government service such as job security, seniority-based promotion, etc., referred to earlier, the keen competition for employment in the public sector has had also a communal dimension to it. It is this obsession with 'sarkar' jobs that has often stood in the way of people venturing into self-employment. Not surprisingly, therefore, even those who initially opt for self-employment are on the lookout for salaried employment. In a sample survey of about 4,000 registrants of employment exchanges in Kerala, Mukherjee and Isaac found that about one-fifth of them were self-employed either on a full-time or on a part-time basis [Mukherjee and Isaac 1991:44], further, only 17.4 per cent of the registrants had any knowledge of special programmes for the self-employment of the educated unemployed. This is ample proof of the fact that self-employment is still a relatively uncharted territory for the vast majority of the educated unemployed in Kerala.

IV

Waiting Period as Measure of Educated Unemployment

The interval between a person's entry into the labour market on completion of education and/or training and the first regular employment is referred to as the waiting period. The duration of this period is often viewed as an index of the gravity of the prevailing educated unemployment. The following observations regarding the concept as it applies to educated unemployment seem to be in order.

(1) Having to wait for regular employment is an unwelcome experience as it involves loss of potential income. However, if at the end of the waiting the job seeker finds that he has obtained a secure job of roughly his choice, he might consider the waiting worthwhile. More often than not, this is the type of waiting that job seekers in Kerala have to put up with. Unlike in the developed economies where intermittent employment and unemployment are a common feature, we have a situation where an initial waiting of, say, three to five years is followed by a reasonably long period of uninterrupted stable employment. It is this aspect which prompted Blaug to say that "educated unemployment in India constitutes, as it were, a revolving queue: it is not that some are permanently employed and others are permanently unemployed, but rather that large numbers are made to wait years before finding a first job" [Blaug 1973b:207].

(2) It is also important to keep in mind that waiting is not a repetitive process. Once regular salaried employment of roughly one's choice is obtained, it is most unlikely under Kerala conditions that the incumbents would

TABLE 8 STOCK OF EDUCATED WORK SEEKERS AS PERCENTAGE OF ANNUAL FLOW OF EDUCATED FOR SELECTED YEARS

Category of educated (general education only)	1966	1972	1989
Matriculates	88	250	554
Pre-degree holders	170	55	182
Graduates	30	90	291
Postgraduates	33	120	427

Note The stock of educated work seekers is estimated on the basis of the number of work seekers on the live-register of employment exchanges as published by the Department of Employment and Training (as on December 31). The annual flow of educated is based on the number of students who pass the relevant examinations each year.

Sources 1 United Nations, Department of Economics and Social Affairs, 'Poverty, Unemployment and Development Policy - A Case Study of Selected Issues with Reference to Kerala', New York, 1975.

2 Government of Kerala, *Economic Review*, 1990 and 1992.

be interested in searching for other jobs and thus involve themselves in further rounds of waiting. This attitude is not necessarily due to strong taboos about changing jobs to enhance one's prospects, as suggested by Blaug [Blaug 1973a:62]. If as a general rule people in Kerala do not prefer to change their jobs, the reasons are to be sought elsewhere - loss of, or reduction in, retirement benefits which vary with length of service, and difficulties faced in moving to distant places within and outside the state such as problems relating to education of children, housing, cultural and linguistic barriers, etc.

(3) Waiting should not necessarily be viewed as infliction of too much hardship on the educated job seekers, as is often made out. (The situation, of course, is different for wage labour.) Scholars are unanimous that the educated unemployed are able to wait for varying periods for the realisation of their job aspirations because they generally have other means of support and few responsibilities [Ridker 1971:13, Blaug 1973a:62; Jolly 1973:11, Lal 1984:92]. An important source of 'other means of support' in the Kerala context is one's own family. It is pointed out that in the absence of such means of support, the educated unemployed will be willing to lower their 'reservation price', or to take a job at any price.

(4) Wherever there is already a large stock of educated work seekers, any addition to it (annual flow), other things remaining the same, is likely to aggravate the problem of educated unemployment and thereby to lengthen the waiting period. Over the years such a process has been taking place in Kerala as seen from Table 8.

It is seen from this that there has been a steady worsening of educated unemployment in Kerala since 1966 as measured by the size of the stock of educated work seekers in each category for every 100 new entrants. In 1989, the latest year for which data are available, for every 100 new matriculates there were already 554 persons of identical qualification waiting for jobs. Similarly, for every 100 new entrants with higher educational qualifications, there were already 182 pre-degrees, 291 graduates and 427 postgraduates waiting. It appears that in the case of matriculates, however, the number of work seekers on the live register is highly exaggerated, as there is a delay or lapse in upgrading the educational qualifications of the registrants, most of whom register at the exchanges immediately after passing the SSLC examination [Mukherjee and Isaac 1991:4-6].⁴

AVERAGE WAITING PERIOD

There are two different senses in which the concept of waiting period can be used, namely (1) average waiting period till the first job, and (2) average waiting period till

the first regular job. Since some jobs are offered on a purely temporary or part-time basis, the waiting period till the first job need not necessarily indicate the true magnitude of the waiting. In such cases we may have to identify the first regular jobs.⁵ For our purpose we shall use the latter interpretation.

Estimates of waiting time

There have been several attempts to measure the average waiting time in respect of educated unemployed; the UN study on poverty, unemployment and development with reference to Kerala (1975), and the one by Mukherjee and Isaac already referred to, deserve special mention.

The UN study (1975) came up with the following findings on average waiting period for the first job on the basis of a sample survey of employment exchange registrants in Trivandrum and Calicut districts in 1973:

The average waiting period for work seekers of all levels of education was 36.6 months in Trivandrum district and 33.4 months in Calicut district. Matriculates had to wait longer (45.4 months in Trivandrum and 43.5 months in Calicut) than persons with higher levels of education such as pre-degree and degree. Waiting period was found to fall sharply as one moved from matriculation to pre-degree level. From then on, the decline in waiting time was at a much lower rate. On the basis of these results, the UN study concluded that waiting periods tend to be inversely related to levels of education - the higher the education, the lower the waiting period [United Nations

1975:129]. If one were concerned with only the educated unemployed, who by definition consist of matriculates and above, this statement is valid. However, couched in such general terms the statement is too sweeping. In general, unemployment rates are low for the illiterate for the obvious reason that they cannot afford to remain unemployed because of their poverty condition. They have, therefore, no choice in the selection of jobs. The rate of unemployment for matriculates exceeds that of primary school leavers and it declines again for those with university education. In many countries unemployment is the highest and the waiting period the longest among matriculates. According to data provided by the Department of Employment and Training, Kerala, the percentage of SSLCs among work seekers increased from 41.7 at the end of 1980 to 51.8 at the end of 1991 [Government of Kerala 1992:143]. This relationship between education and unemployment has prompted some economists to allude to an inverted U-shape [Blaug 1973a:9; Squire 1981:69]. The UN study on Kerala has,⁶ however, focused attention only on the second half (downward sloping portion) of the inverted U-curve and inferred an inverse relationship between education and waiting period. The UN study also found that (1) average monthly pay rose with the level of education, (2) waiting period for Muslims and scheduled castes was somewhat lower than for others, (3) waiting period was inversely related to family income, (4) chances of securing salaried employment rose with family income and

Source: Mukherjee and Isaac 1991: 138, Table 5.4 A and 5.4 B

correspondingly among the jobless average waiting periods were longer for the relatively poorer; and (5) waiting periods were significantly lower for registrants belonging to households of salaried white collar earners, and by the same logic chances of finding employment were lowest for registrants from wage-labour households.

Another attempt to estimate the waiting period to the first job was made by Mukherjee and Isaac on the basis of a sample survey of registrants of employment exchanges conducted during August-October 1989. The sample used for waiting period analysis consisted of 1,086 persons on the live register and 416 on the dead register. The findings of the survey regarding waiting period to the first job are summarised in Table 10.

We note that average waiting period varies considerably across levels of qualifications. While at one end of the spectrum those with only SSLC have an average waiting period of over three years, postgraduates and engineers have to wait for only one to one-and-a-half years. Significantly, waiting period falls by about a year if one has vocational training. Another interesting finding of the sample survey is that if the registrant has a vocational qualification, it does not make any difference whether the general education consists of SSLC or PDC.

A comparison of the results of the two sample surveys (the UN study and Mukherjee and Isaac) leads to certain interesting findings. The analysis undertaken by the UN study was too general as all the registrants were grouped into just three broad groups, namely matriculates, PDC's and degree holders, whereas the study by Mukherjee and Isaac had nine categories of registrants in all. The complete omission of the role of vocational qualifications in influencing the waiting period was a serious flaw of the UN study. This defect was taken care of in the other study. Further, while according to the UN study the average waiting period to the first job beginning with matriculates fell (thus conforming to the second half of the inverted U-shaped curve referred to earlier), as one moved to higher levels of education, the pattern of waiting brought out in the study of Mukherjee and Isaac shows that the waiting period of registrants with pre-degree or its equivalent is higher than those with SSLC. The inverse relationship between waiting period and level of education highlighted in the UN study is thus seriously challenged by the results of the study by Mukherjee and Isaac. Yet another difference consists in the relative change in duration of the waiting period for similar categories over time. A comparison of the results of the two surveys, one conducted in 1973 and the other in 1989, shows that the waiting period for matriculates has significantly fallen and that for PDC's, graduates and post-graduates has increased considerably.

This is contrary to what one would logically expect in an economy in which unemployment has been mounting. Part of the explanation may lie in the fact that whereas the sample used for the UN study was confined to Trivandrum and Calicut districts, Mukherjee and Isaac drew the sample from as many as eight districts.

We may also briefly refer to the other results of the 1989 survey and compare them with those of the 1973 study. (1) Both surveys have shown that average monthly salary generally goes on increasing with higher educational and vocational qualifications. (2) Whereas the 1973 survey showed that the waiting period for Muslims and scheduled castes was lower than for others, according to the 1989 survey the average waiting time for registrants from scheduled caste/tribe and backward caste households was marginally higher for jobs with higher monthly salary than for those from forward communities. (3) The finding of the 1973 survey that waiting periods are inversely related to family income has been corroborated by the 1989 survey, according to which registrants from higher income households in general got their jobs faster and at higher salaries irrespective of the level of education. (4) Unlike in the case of the 1973 survey, the 1989 survey did not indicate any discernible pattern in the average waiting period across the categories of

occupations of the main earner of the household. However, average monthly salary was lowest for registrants from wage-employed or blue collar households at almost all levels of qualifications.

V Sample Survey Results

We shall now present the findings of a limited sample survey of salaried employees numbering 853 conducted by this author in Thiruvananthapuram during March-September 1992. In interpreting the data collected from this survey, the following limitations, or grounds on which the data could be criticised, may be borne in mind. (1) Thiruvananthapuram, being the capital of the state, most of the salaried employees covered by the sample work either for the government or for public sector undertakings. A similar survey conducted elsewhere in Kerala might give somewhat different results. (2) Though much care was taken to make the sample as representative as possible in terms of the type of employment, type of employer, caste, gender and educational level of the employees, etc., it was not strictly based on a well-defined statistical design. (3) Since we are interested in waiting period completed and not waiting period continuing, we are justified in choosing a sample from persons already in regular employment.

TABLE 11 AVERAGE WAITING TIME TO FIRST REGULAR JOB AND AVERAGE STARTING PAY BY QUALIFICATION AND SEX

Qualification	Average Waiting Period (Months)			Average Starting Basic/ Consolidated Pay (Rs Monthly)

However, one might argue that these persons are the 'fortunate' few who have succeeded in securing jobs while there may be many others whose waiting periods are not yet over.

WAITING PERIOD AND STARTING PAY

Coming to the results of the survey, two clarifications regarding waiting period seem to be necessary. (1) In the case of employees who are matriculates, it is highly probable that they passed their SSLC before attaining the age of 18, but became eligible for employment only on completion of 18 years as most regular salaried jobs stipulate a minimum age of 18 years. We have taken care of this problem by treating 18 as the minimum age at which work seekers enter the labour market and have estimated the waiting period accordingly in all relevant cases. (2) The waiting period naturally includes also the time spent by the prospective employer or the recruiting agency (like the Public Service Commission) to process the applications received and to schedule the interviews. Often these procedures may take up to two years or more. However, since such procedures are a common feature of almost all appointments, the delay may not account for any serious distortions in the relative waiting periods different categories of work seekers have to undergo.

Two distinct trends regarding waiting period may be noted from the data presented in Table 11—one representing the relationship between general education and waiting period and the other representing the effect of vocational/professional qualifications on waiting period. (1) For employees with general educational qualifications only, the absolute waiting time is quite high irrespective of the level of general education; however, the waiting time generally declines as one moves from SSLC to postgraduate levels. The fact that the waiting period is about the same for pre-degrees and graduates indicates that employers make little difference between the two. (2) For persons with vocational or professional training, the absolute waiting time is distinctly low. Here too, there is a declining trend as one moves from lower to higher levels, i.e., from SSLC+vocational/professional training to postgraduate+vocational/professional training, and from lower to higher types and levels of vocational and professional training, as for example, when one moves up the educational ladder from certificate to diploma courses and from diploma to degree levels. The vocational and professional qualifications represented by the sample include engineering, nursing and midwifery, stenography, physiotherapy, teachers' training, travel and tourism, pharmacy, library science, computer programming, etc. It may be noted that among

matriculates with vocational/ professional qualifications, teachers' training certificate (TTC) holders had the shortest waiting period (33.1 months) and also the highest starting pay of Rs 1,002. In the case of pre-degrees with additional qualifications, diploma holders in general nursing and midwifery had the unique distinction of having to wait for only 9.2 months for their first regular job but salary-wise they were far behind compared to others. Diploma holders in pharmacy and diploma/certificate holders in travel and tourism and hotel management also had relatively short waiting periods (27.8 months and 30.9 months respectively). The latter category also enjoyed the highest starting pay of Rs 1,282. With regard to graduates with vocational/professional qualifications, graduates in library science had a relatively short waiting period of 20.7 months followed by BEd degree holders (30.7 months). However, the starting pay enjoyed by the library science graduates (Rs 1,225) was lower than the highest pay in the category received by graduates with diploma in engineering (Rs.1282). For postgraduates with vocational/professional qualifications, library science graduates again had the shortest (18.5 months) waiting period, followed by BEd degree holders (25 months). Their starting pay was, however, slightly lower. This discussion shows that though educated unemployment prevalent in Kerala presents a scenario of long waiting periods, there are still certain vocational/professional programmes which, if judiciously combined with general education, can prove to be of much promise (e.g., nursing and midwifery, teachers' training, travel and tourism, hotel management, library science, pharmacy, engineering, etc.). A major finding of the survey, therefore, is that although there is much educated unemployment in the state involving long waiting periods, the plight of those with certain vocational/professional training is not generally so desperate. It is the ordinary run of matriculates, graduates and postgraduates who bear the brunt of educated unemployment.

Regarding the relationship between educational level and salary, we may, as a matter of abundant caution, not accept at their face value the starting basic/ consolidated pay reported, as there could be memory lapses on the part of the respondents, particularly as a result of pay revisions subsequent to their entry into regular employment. At least in some cases what the respondents have reported as basic pay might be inclusive of allowances.⁷ We may, therefore, pay more attention to the relative rather than the absolute magnitudes. The relative magnitudes, however, do fall into a fairly consistent pattern; in general, higher qualifications account for higher pay. Professional degrees, which do not strictly

form a homogeneous group, stand on a somewhat different footing.

As for gender differences in waiting time, the data do not indicate any consistent pattern. For the entire sample, the waiting period for females (34.22 months) is less than that of males (39.66 months) by 13.7 per cent. On the other hand, generally females have a slightly lower starting pay of Rs 1,131 compared to Rs 1,242 received by males. We also observe that for each qualification level female salaries are a bit lower than male salaries.

We may also briefly refer to differences among members of forward, backward and scheduled caste/scheduled tribe communities in respect of waiting period and starting pay (Table 12). It is seen that, in general, average waiting period for members of the forward communities is much lower and starting basic pay higher than those belonging to scheduled castes and scheduled tribes and other backward communities (OBCs). However, there is no regular or logically consistent pattern of waiting period or starting pay associated with different qualification levels of these communities. One fact, nevertheless, stands out prominently—but for the distinctly long waiting period of the salaried employed with only SSLC level general education and no vocational or professional training, the average waiting period of the SC/ST members would be 30.6 months which is much less than that of the salaried employed from the forward communities.

Finally, it is important to note that although in terms of employment prospects the plight of graduates in general is very bleak, there are significant differences among arts, science and commerce graduates as shown by our survey data (Table 13).

TABLE 13: AVERAGE WAITING PERIOD AND STARTING PAY (BASIC/CONSOLIDATED PER MENSEM) OF ARTS, SCIENCE AND COMMERCE GRADUATES

Category of Graduates	Average Waiting Period (Months)	Average Starting Pay (Rs)
BA	57.51	1019
B Sc	50.56	1022
B Com	41.73	1185

TABLE 14: AVERAGE WAITING PERIOD AND STARTING PAY FOR PROFESSIONAL GRADUATES

Category	Average Waiting Period (Months)	Average Starting Basic/ Consolidated Pay (Rs)
Engineers	27.34	1687
Doctors (medical and dental)	18.36	3084
Nurses (graduate)	7.93	1234
Agricultural graduates	36.77	1378

It is found that while the average waiting period of science graduates is much less than that of arts graduates, there is practically no difference in their starting salaries. The average waiting period for science graduates is shorter because relatively speaking there is greater demand for them; there is no salary difference because for several posts like clerks, supervisors, salesmen, etc. the scale of pay is the same for the two types of graduates. However, in banks and other commercial establishments where accountants are required, commerce graduates have an edge over arts and science graduates. Science graduates employed in institutions of scientific research and in industry start on a higher pay, but our sample does not include many such cases.

PROFESSIONAL GRADUATES

So far our discussion has centred around educated salaried-employed consisting of undergraduates, and arts, science and commerce graduates and postgraduates with or without qualifications in vocational or professional fields. During the course of our discussion we have already covered a number of instances in which the employed persons concerned had passed certificate or diploma courses in technical and professional subjects but did not have a degree. It is well known that professional degree holders such as medical and dental doctors, engineers, agricultural scientists, veterinary doctors and graduate nurses have an advantage over certificate and diploma holders in these fields, as normally degree holders are preferred to certificate or diploma holders in appointments and promotions (note that there are at present no certificate or diploma courses in medicine and dentistry). Naturally, given the choice, students opt for degree courses in preference to certificate or diploma courses. In the study conducted by Mukherjee and Isaac referred to earlier, only engineering was included in the professional category. It is not clear whether this category consisted of only graduates or it included also certificate and diploma holders. However, according to their findings, this category had the lowest average waiting period of 12.8 months for males and 15.5 months for females and also the highest average monthly salaries.

Our own sample survey of educated employed has provided a better coverage of professional degree holders consisting mainly of medical and dental doctors, engineers and nurses. For the entire group of these professional degree holders numbering 118, it was found that the average waiting period to the first regular job was 18.3 months-20.4 months for males and 17.2 months for females. The lower

waiting period for females is explained by the fact that the group of professional graduates consisted of a disproportionately large number of graduate nurses for whom there is no dearth of employment opportunities, and hence their waiting period is much lower than that of others. The average starting basic/consolidated pay for the group as a whole was Rs 1,808 per month - Rs 2,141 for males and Rs 1,630 for females (note that the markedly lower salary of females is again explained by the large number of nurses in the sample). It may further be noted that professional degree holders as a group have slightly longer waiting periods and lower starting pay than the category of postgraduates with research degrees such as MPhil and PhD. This is largely explained by the fact that among professional graduates we have not made any distinction between professionals with only bachelor's degrees and specialists with masters' and higher degrees. It is well known that medical and dental doctors with postgraduate and higher degrees do not have to wait long for appointment and that they generally start at a much higher salary. The same may be true of engineers, nurses and agricultural graduates to a lesser extent. Since our sample has very few professionals with postgraduate qualifications, we have clubbed the graduates and postgraduates together under 'professional graduates'. Their waiting period to the first regular job and starting basic pay are given in Table 14.

As between engineers and doctors, the former have to wait much longer than the latter for their first regular job and have to be content with a much lower starting pay. A major explanation for this difference may be sought in the fact that the supply of engineering graduates relative to demand

is much higher compared to medical and dental doctors*. The waiting period for graduate nurses is one of the lowest among job seekers. This is explained by the relatively inelastic supply of degree holders in nursing; a total of only 75 students are yearly admitted to the B.Sc (Nursing) course in the entire state. This is grossly inadequate considering the growing demand for well-qualified nursing staff in both public and private sectors.

VI Unemployment among Professionally and Technically Educated Workforce

We may conclude this paper with a brief discussion of the nature and extent of unemployment prevailing among professional and technical work seekers in Kerala. Though the National Sample Survey is a much better source of data on unemployment than the information gathered from employment exchanges [Visaria and Minhas 1991:969], since the NSS data do not provide statewide or categorywise break-up of professionally and technically educated unemployed, we are constrained to rely on employment exchange data. As a precaution, however, we may point out that we are using the employment exchange data to highlight the relative magnitudes involved and not the absolute number of unemployed in each category. According to Visaria and Minhas, an important factor contributing to the sharp rise in the number of higher educated persons on the live register of employment exchanges has been their greater tendency to register over the years (1991:976). This observation for the country as a whole must be truer of Kerala than for other states for obvious reasons.

TABLE 15 DISTRIBUTION OF PROFESSIONAL AND TECHNICAL WORK SEEKERS IN KERALA

na Not Available

Source: Government of Kerala, *Economic Review* (various issues), State Planning Board.

It is seen in Table 15 that the highest increase in the number of work seekers on the live register of the employment exchanges in Kerala is accounted for by ITI certificate holders. Surprisingly the second rank goes to medical graduates (veterinary and agricultural graduates appear to be the least vulnerable). In terms of number of job seekers, however, there is no comparison between the two categories. The phenomenal increase in the number of ITI certificate holders on the live register is primarily accounted for by the unprecedented expansion in the number of both ITIs opened and the number of trainees enrolled. The number of ITIs increased from 38 to 343 and the number of trainees enrolled from 8,776 to 42,996 during the period 1971-72 to 1992-93. The extremely liberal policy followed in the sanctioning of ITIs in the private sector, which increased from 28 in 1971-72 to 315 in 1992-93, was responsible for the rapid increase in the number of ITI certificate holders on the live register of employment exchanges. Obviously, there has been no matching increase in the demand for the products of the ITIs from industry. The situation is not far different in the case of diploma holders in engineering and technology, and engineering graduates. The general disinclination towards self-employment on the part of skilled manpower, apart from the various obstacles one has to encounter in taking it up, is one of the reasons for seeking salaried/wage employment. Among the reasons for the poor performance of the various self-employment schemes in Kerala, Mukherjee and Isaac have mentioned delays in the processing of the loan applications, inadequacy of capital, inadequate training, insufficient institutional support and unsatisfactory repayment performance (1994: 11-14).

The case of medical graduates is altogether different. The fact that there were 1,959 medical graduates on the live register of employment exchanges in 1991 is no proof that there is acute unemployment among doctors in Kerala. It is very doubtful if there are genuinely unemployed medical doctors at all in the state. Because of the rapid growth of well-equipped modern hospitals in the private sector in Kerala, it is normally not difficult for a medical graduate to find employment as a junior doctor on a consolidated pay of around Rs 2,000 per mensem. Most of the doctors, however, prefer government jobs, because while doctors employed in private hospitals are not permitted private practice, it is possible to combine both in government service including government medical colleges. In fact, it is the virtually unlimited scope for private practice that encourages doctors to opt for government service although salaries in government are not as attractive as in the private sector. To some extent this is true

also of engineers, especially architects and civil engineers.

VII Conclusion

Educated unemployment in Kerala has assumed alarming proportions in recent times. According to NSS data, the number of educated unemployed in the state rose from 3.51 lakh in 1983 to 6.34 lakh in 1987-88. Among the causes of educated unemployment, the foremost contributory factor has been the opening of too many arts and science colleges since the 1960s coupled with ridiculously low level of college fees. To make matters worse, there has been a distinct preference on the part of work seekers for salaried employment, especially in the public sector in view of its built-in attractions such as security of tenure, seniority-based promotions, etc. The growing unemployment among the educated has led to a steady decline in the real earnings associated with different levels of education. However, earnings have not declined fast enough to reduce the incentives to acquire still more education. Pursuit of traditional academic subjects is another factor contributing to educated unemployment.

Some development economists have attempted to explain educated unemployment in developing countries in terms of the work seekers' preference for white collar jobs and their aversion to manual labour.

However, as far as Kerala is concerned, what is often mistaken for a bias in favour of white collar occupations is in fact a preference for salaried employment over self-employment.

A limited sample survey conducted by the author shows that: (1) In the case of job seekers with only general education, the waiting period till the first regular employment is in absolute terms quite high irrespective of the level of general education; however, the relative waiting period generally declines as one moves from SSLC to postgraduate levels. (2) For work seekers with vocational or professional qualifications the waiting period is distinctly lower. Here too there is a declining trend as one moves from lower to higher levels of vocational or professional education. (3) As for gender differences in waiting period, the data do not indicate any consistent pattern. (4) It was found that average waiting period for members of the forward communities was much lower and starting basic pay higher than for those belonging to scheduled castes and scheduled tribes and other backward communities, qualificationwise, however, no consistent pattern was observed. The sample survey treated professional graduates as a separate category. Of the four categories of professional graduates represented, namely, engineers, doctors (medical and dental), nurses and agricultural graduates, it was found that nurses (with a BSc degree in nursing) had the lowest average waiting

period while agricultural graduate had the highest. Doctors had the second lowest waiting period. As for starting basic pay, doctors obviously had the highest pay while nurses stood at the lowest rung of the ladder. Finally, reference was made to the growing number of job seekers with medical and engineering degrees on the live register of employment exchanges in the state. This trend has been attributed to the desire of professional graduates to take up government jobs which enable them also to carry on private practice which private sector employers seldom permit.

Notes

[This paper forms part of a larger study on unemployment in Kerala I have undertaken under a Senior Fellowship of the ICSSR. I am thankful to K P Kannan for his detailed comments on an earlier draft of this paper. A part of this paper was presented at a workshop on 'Employment and Unemployment Trends in Kerala' held at the Centre for Development Studies in January 1994. I am grateful to the participants of the workshop for their valuable suggestions. I also thank P Sankara Sharma and Sabu Philip who have been of much assistance at different stages in the preparation of this paper.]

- 1 To give just two examples, clerical posts in the Kerala government secretariat and in the office of Kerala University which once used to be filled by matriculates are now available only to graduates, earlier the minimum qualification prescribed for recruitment of police constables in the state was schooling up to eighth standard, whereas it is now 10th standard.
- 2 If a person instead of accepting the post of primary teacher starting on a basic pay of Rs 1,125 opts to put in five years of additional education, he/she can aspire to get appointed as a high school teacher on a starting basic pay of Rs 1,350. It can be shown that the additional annual income thus earned, namely Rs 2,700, is much higher than the annualised expenditure (including income foregone) on additional education. The difference in earnings would, of course, widen over the years.
- 3 The Malayali Memorial submitted to the Dewan of Travancore on July 2, 1881 and to the Maharaja on the next day was signed by 10,028 citizens belonging to all castes and creeds.
- 4 Reworking the employment exchange statistics as on December 31, 1989, they found that as against the official figure of 15,51,843 matriculates forming 83.37 per cent, the revised estimate was only 10,48,454 (56.32 per cent). This finding was reinforced by cross-tabulations of the sample registrants and the NCO codes allotted to the registrants by the employment exchange authorities. 40 per cent of the pre-degree and 18.96 per cent of the degrees, 12.84 per cent of the postgraduates and 8.10 per cent of the engineering degree holders had only SSLC by the NCO classification.
- 5 A worker, instead of sticking to the first regular job, may decide to quit the job in order to take up a more remunerative or challenging job. Such change of jobs is purely voluntary and hence does not constitute further waiting.

- 6 The sample size selected for the survey consisted of 309 registrants in Calicut and 503 registrants in Trivandrum. The former was made up of 190 persons from the live register and 119 from the dead register, the latter consisted of 413 persons from the live register and 90 from the dead register. It may be noted that employment exchanges maintain in addition to the live register also a so-called dead register of persons who fail to renew their registration from time to time. The survey conducted for the UN study included also a sample from the dead register since, among other reasons, it was expected that persons with completed waiting periods could be found in a greater proportion on the dead register than on the live register.
- 7 Further, the fact that employees in each category (based on qualification) obtained their jobs at different points of time introduces a certain bias. We know that over the years pay scales have been rising; therefore if more people belonging to one category secured their jobs at a later point of time than employees of another category, the average salary of the former would be higher.
- 8 At present there are 11 engineering colleges in Kerala, nine colleges under the Directorate of Technical Education of the state government, one regional engineering college and one model engineering college under the Institute of Human Resources Development for Electronics (another college has just started functioning). These colleges admitted a total of 2,901 students to the various courses during the academic year 1992-93. In sharp contrast, the five medical colleges in the state admit only a total of 700 students to the MBBS course and 70 students to the BDS course. To these streams may be added those Keralites who join engineering and medical colleges outside the state. It is very likely that their numbers also are weighted in favour of engineering students.

Consolidation of Maratha Dominance in Maharashtra

S M Dahiwale

Besides their numerical strength, the legacy of the non-brahmin movement of the pre-independence period and the continued control over land, co-operatives and other institutional resources have enabled the vatandar marathas of south-western Maharashtra to maintain their hegemony in state politics.

A DOMINANT caste is determined by its numerical strength, its extent of economic and political control, and its superior status in the caste hierarchy.¹ For a caste to be dominant, David Mandelbaum adds one more attribute of a 'self-image as rulers' (1972:359). In Indian villages, land is the principal source of economic control. Those who possess substantial land can exercise control over the landless and the marginal landholding families since the latter are dependent upon big landholders for their livelihood. During post-independence period, traditional agronomy has changed and a process of agro-based industrialisation has taken place in certain parts. Big landholders have cornered a sizeable chunk of the agro-based industrial economy and have become all the more powerful. Thus, land is not only a source of economic control but also of political power. Walter Neale states that, "the Indian view of land was also political" (1969:7) and, "the Indian who acquired political power almost inevitably acquired control of land, which was the main source of wealth or income" (1969:9). In democracy, numerical strength undoubtedly has a political significance. The contestants for power seek followers and allies from kins, relatives, caste and village so as to increase their tally [Neale 1969:9-10]. These units of 'social organisation' are one of the sources of power. Thus, the scholars consider land, number, social organisation, ritual status and self-image as rulers, as the requisites for caste dominance. In the light of this conceptual formulation, the article examines the domination of the marathas in Maharashtra. The article addresses following questions regarding the maratha domination: how far is the numerical preponderance of the marathas decisive in their dominance? Why do the marathas of the Deccan mostly occupy positions in the higher echelons? Why do the kunbis of Vidarbha have little say in the state politics? And finally, what is the class status of those in influential positions within their caste-group?

I Numerical Preponderance of Marathas

The domination of the marathas in the power structure is generally ascribed to the

large number. Since enumeration by caste criterion was not continued by the census after 1931, we do not have currently a reliable figure of the maratha population. Irawati Karve estimated the population of the maratha-kunbi cluster to be about 50 per cent (1975:29). Anthony Carter estimated it to be 55 per cent in rural Maharashtra (1975:5), whereas Shashikant Pawar, the president of Maratha Mahasangha, has put the figure around 35 per cent [Nagarsekar 1986]. Recently, Jayant Lele derived the present-day population of the maratha-kunbis² from the 1931 Census reports of the Bombay presidency, the Hyderabad state and the central provinces and Berar,³ to be 31.19 per cent [Lele 1990:116]. The kunbis are mostly concentrated in the nine districts of Vidarbha. If their population is estimated to be 10 per cent, then the population of the marathas comes to 21.19 per cent (see the table).

II Socio-Political Background

The ancient brahmanical⁴ traditions were revived in Maharashtra under the Peshwa rule (1713-1818). Especially under the later peshwas, from late 18th century onwards, the brahmins enjoyed special privileges, and the shudras and the ati-shudras suffered disabilities:

Performing the religious ceremonies with the Vedic mantras was the privilege of the Brahmins, while the shudras had to be content with the Puranic mantras. The brahmins had the monopoly of religious priesthood. They were given 'Dakshana' (gift) to encourage learning. The lands of the brahmins was assessed at half or lower rates than those of other classes. The land revenue in cash from the brahmins and in kind from others were accepted. Discrimination was observed in punishing the culprits. For example, on a charge of murder an accused brahmin was asked to visit a holy place, while a shudra or an ati-shudra accused of theft was given punishment of amputation of one or more limbs. In 1785, in a case, 20 persons from ati-shudras were beheaded for committing theft. Prisoners from the lower castes were asked to do hard labour of building fortresses. The shudras had no right to inter-dine with the brahmins. The untouchable mahar had to carry an earthen pot hung from the neck

for spitting and also had to drag a thorny branch to wipe out his footprints. The ati-shudras were forced to live on the outskirts of the village. After 1785, officiating marriages of the untouchable mahars by the brahmin priests were discontinued [Kadam 1972-73:236-42].

In 1818, the peshwa rule ended and the British came to power. In the Bombay presidency, the British initially decided to adopt the policy of non-interference in caste matters. But, in certain cases caste authority was not recognised. For instance, the Bombay High Court permitted people to engage a non-brahmin priest. The decree threatened the monopoly of the brahmin priesthood. In 1856, when a mahar boy was refused admission to the government school at Dharwar, the Bombay government resolved that "all schools maintained at the sole cost of government shall be open to all classes of its subjects without distinction" [Ghurye 1969:275]. Such instances indicate that the privileges of the brahmins and the disabilities of the lower castes were gradually desisted under the British rule. However, in practical life, the brahmanic order based on purity-pollution principle, was functional.

HEREDITARY LANDHOLDING PATTERN

In Maharashtra, many maratha and kunbi families have been landholders since pre-Shivaji times. Under the Muslim regime the village revenue was in the hands of patils, kulkarnis, deshmukhs, deshpandes, sardeshmukhs and sardeshpandes. Patils and deshmukhs were generally from the maratha-kunbi caste. Shivaji belonged to the ruling class of jagirdars. But, in Shivaji's time,

CASTE AND RELIGIONWISE DISTRIBUTION OF MAHARASHTRA POPULATION

Group	Percentage	Source

Brahmin	03.90	"
Others	30.14	Estimated
Total	100.00	

there was no policy of making offices hereditary, nor was there a system of assignment of revenues or land for military services. After Shivaji's death his successors departed from the policy of fixed pay and continued the old Muslim system of hereditary revenue authorities.

In the kingship system the village land was allotted to assignees. The assignees, the holders of village land, occupied hereditary offices such as mirasdars, mokadam, kulkarni, padewar, deshmukh and desh kulkarni. The officials performed services to the king in lieu of granted lands. But the actual cultivators of lands were tenants and peasants. The cultivators paid the land revenue to the inamdars and jagirdars who were the appropriators of the whole or part of the land revenue. A piece of land was granted to a priest of the village, usually a brahman, for the performance of a religious service. Such land was referred to as Devasthan land, which was not transferable [Kulkarni 1961].

Apart from this account of land allotment, land was offered as gifts to the maratha gentry in return for supply of armies. During the peshwas, the lands were granted to brahmins as a religious privilege [Wink 1986]. Thus, the marathas as warriors and officials, and the brahmins in the capacity of ministers and priests received land grants from the royal princes.

Three different views have been held regarding land ownership in western India. According to Baden-Powell, the landholder had no ownership rights in the medieval Deccan but the land was held in virtue of an office [Baden-Powell 1972: 423-24]. A S Altekar states that the ownership of lands was vested in the peasant proprietors [Altekar 1927:86]. S N Sen has given a detailed account of village land ownership in the 18th century Deccan, mentioning that the village land was divided among the hereditary officers, village servants, the mirasdars and the 'upris' (outsiders). In lieu of services land was granted to the hereditary officers and village servants, while the mirasdars had proprietary right in their lands. The upris were the tenant-at-will on government lands under the management of mamlatdars [Sen 1923]. Hiroshi Fukazawa, an eminent Japanese scholar of south Asian history, has endorsed S N Sen's presentation as being closer to the ground reality [Fukazawa 1991: 149-50]. Fukazawa also states that high offices, for example, headmanship of villages, were held by the brahmins and sizes of the inam lands granted to them were comparatively larger. The brahmins being absentee landlords, their lands were cultivated by sharecropping peasants [Fukazawa 1991: 178-80].

In the early 19th century, the miras lands were generally cultivated by mirasdars themselves, who belonged to the merchant

and intermediate castes. But many mirasdars leased out their lands to peasants on sharecropping basis. The state lands and wastelands were cultivated by tenant-peasants [Fukazawa 1991: 183-84].

In Konkan, a part of the Bombay division, the khoti system of revenue farming was introduced in 1504. In the khoti system, the government collects revenue from the khots. This system was prevalent in Ratnagiri district and in some parts of Kolaba (Raigad) and Thane districts. The khots were hereditary landholders who had received lands from former territorial chief or local land officer. However, Andre Wink informs that the khots were hereditary in the southern Konkan while in the northern part they were non-hereditary (1986:362). Baden-Powell mentions that the khots belonged to all castes. Under the Muslim rule they were constituted by the marathas or the mussalmans (1974: 294). In the peshwa period, many brahmin families were made khots, reducing the older khot families of the marathas and the Muslims. During the later period, under the British rule, many khots were brahmins and marathas. Before 1949, there were 952 khoti villages in Ratnagiri. After independence, the khoti tenure system has been abolished by the Bombay khoti abolition act of 1949. In Vidarbha, most of the malgujars were brahmins. In Marathwada, under the Nizam's rule, maratha deshmukhs were the tax collectors. Keeping in mind the hegemony of the high castes, Bhaskarrao Jadhav, the then legislator, had proposed in 1927 for a ceiling on landholding in the Bombay legislative council.

Thus, the above account of land allotment and grants shows that under the peshwa and the British rule, brahmins were predominantly controlling lands and a large number of maratha and other intermediate castes were tenants.

PHULE'S REVOLT

In 19th century, Mahatma Phule (1827-1890), a non-brahman of mali caste (gardener), emerged with his radical critique of brahmanism and economic exploitation by Gujars and Marwaris. He was the first Indian to start schools for girls in 1848, 1851 and 1852. He founded the Satyashodhak Samaj (the organisation of truth-seekers) in 1873 to educate and enlighten the illiterate and ignorant masses, and to liberate them from religious persecution. He rejected brahminism based on the shastras and the puranas and propagated a Sarvajanic Satyadharma (universal religion of truth) based on rationality and equality. He performed marriages without the help of a brahmin priest. Regarding Phule's view on the village system, Gail Omvedt mentions:

Phule wanted sweeping changes within village society itself. His primary goal was not simply to replace a brahmin-dominated bureaucracy with a non-brahman bureaucracy and it was not simple to transfer power to the villages. Rather he wanted to revolutionise village system. Not only should the position of kulkarni be abolished; also the patil's and other watan posts should be opened up to all on the basis of merit through special training schools. Thus the entire balutedar system with its relation to traditional caste privileges and functions was to be destroyed along with the hereditary linking of caste and occupation [Omvedt 1976:120].

Thus, Phule was a social revolutionary who organised shudras and ati-shudras against the brahmin tyranny. It is noteworthy that aristocratic marathas, lingayats, jains and kayasthas did not participate in Phule's satyashodhak movement [Phadke 1989:254]. However, Bhaskarrao Jadhav, an aristocratic maratha, established a branch of satyashodhak samaj in 1911 to revive the movement. Like Phule, he was critical of brahmanic literature and wrote scathing articles on *Ramayan* in Marathi periodicals between 1935 and 1938.

MARATHAS IN NON-BRAHMIN MOVEMENT

In the beginning of the 20th century non-brahmin leaders who identified themselves as satyashodhaks no more followed the revolutionary ideology of Phule. The principal reason was the overall domination of the brahmins in the national Congress, Bombay legislative council (BLC) and the British administration. In November 1899, an incident occurred wherein Narayanbhatta, an officiating priest, did not utter the vedic mantras while performing bathing ceremony of Chatrapati Shahu of Kolhapur, since the latter did not belong to kshatriya caste. This created a fury amongst the non-brahmins. Shahu (1874-1922) started a movement against brahmin bureaucracy of Kolhapur and a movement for the upliftment of the untouchables as well. Two maratha princes, Shahu of Kolhapur and Sayajirao Gaikwad of Baroda, took significant steps to better the lot of the untouchables. In 1913, Sayajirao Gaikwad sent Bhimrao Ambedkar to America for higher studies. Shahu, too, is well known for his reformist activities in his Karveer state. He abolished untouchability. He felicitated Ambedkar for his academic achievement abroad. In 1920, he helped him publish *Mukanayak*, a Marathi periodical from Bombay. He organised a conference of untouchables under the chairmanship of Ambedkar in 1920. In 1902 he issued a notification reserving 50 per cent of state jobs for the non-brahmins.

Maharshi Vitthal Ramji Shinde (1873-1944) also contributed to the removal of

untouchability. From 1903-1906, he toured throughout India to study the socio-economic conditions of the untouchables. In 1906, he founded the Depressed Class Mission to provide education and employment to the untouchables. Thousands of untouchables took education in the mission's schools. He was active member of the Congress and tried to change the attitude of the caste Hindus towards the untouchables from the Congress platform. It was because of his initiative that the resolution of the removal of untouchability was passed in Calcutta Congress session of 1917. He wrote scholarly essays and books on the problem of untouchability [Shinde 1976]. Thus the early maratha leaders regarded the untouchables as a subsection of non-brahmins and were sincerely concerned with their upliftment.

It is interesting to understand why Shahu opted for policies favouring the non-brahmins. It is obvious that he was hurt by the vedokta incident of 1899 which did not recognise him as a kshatriya. Moreover, the intervention of Bal Gangadhar Tilak in both the vedokta and the abolition of the kulkarni and joshi watans (hereditary offices) on the side of the brahmins kept the issue burning. Tilak was against non-brahmin representation and criticised the non-brahmin leaders for supporting communal representation in 1917. In 1917 Montagu-Chemsford declared to grant a caste-based representation which encouraged the marathas to establish the Maratha League on December 16, 1917. Shahu lauded the provision of caste-based representation at Khamgaon. In a letter written in September 1918 to Lord Sydenham, the governor of the Bombay presidency, Shahu justified the communal electorates for the marathas because the brahmins had monopolised services in the British administration and hence, the grievances of non-brahmins did not reach the British officers [Kavalekar 1979:227]. On January 31, 1919, when the Southborough Committee on franchise decided to give representation to non-brahmins, Bhaskarrao Jadhav and the Maratha League demanded separate representation for the marathas.

Further, the Montagu-Chemsford declaration encouraged the non-brahmin leaders to publish periodicals, such as *Rushtraveer*, *Shivachhatrapati*, *Chhatrapati*, *Tarun Maratha*, *Garibancha Kaivari*, *Bhagva Zenda*, *Shrishivasmarak*, *Vijayi Maratha*, *Deen Mitra*, *Jagruti*, *Hunter*, *Kaivari*, *Pragati*, *Jinvijaya* and *Navyug*. The very titles of these periodicals suggest the spirit of non-brahminism. The publication of non-brahmin periodicals was so essential that Shahu extended monetary support to Mukundrao Patil to continue the publication of his periodical *Deen Mitra* when it was on the verge of extinction [Phadke 1989:263].

Shahu apprehended that if power again went to the brahmins, attempts would be made to resurrect the age-old brahmanical regime [Lathe 1924:566]. As a result, many non-brahmin leaders got elected to the BLC in November 1920. To capitalise upon this success the Deccan Non-Brahmin League was formed on December 12, 1920 [Omvedt 1976:190].

After the death of Shahu in 1922, the non-brahmin movement was led by Keshavrao Jedhe and Dinkarrao Jawalkar. The historical incidents of refusing kshatriya status to Shivaji and Shahu by the brahmin priests agitated the minds of the marathas. In 1921-23 the non-brahmin activists of Satara and Solapur targeted the brahmins. They abused and mocked brahmins and abstained from inviting them to perform the household rituals. They taunted brahmin women and burned their houses and looted their crops. The non-brahmin tenants refused to till the lands of brahmins [Phadke 1991:217-19].

In 1923, 13 non-brahmin leaders got elected to the BLC. Bhaskarrao Jadhav was already a nominated member of the BLC in 1922. In the BLC election campaign of 1923, Bhaskarrao Jadhav exhorted the marathas to give votes to their fellow representatives and got elected from Satara [Phadke 1991:227]. He formed the non-brahmin party with the help of 13 non-brahmin legislators in 1923. In the 1920s, the non-brahmins gained control of the local boards in Satara, Solapur, Nasik and Buldhana districts, while in other districts they were not equally successful [Omvedt 1976:199]. It is evident that wherever the non-brahmin movement was strong, the non-brahmins could wrestle power from the brahmins. After gaining control over the local boards the non-brahmins started education institutions and student hostels. Phule and Shahu had already set the tempo.

In 1924 Karmaveer Bhaurao Patil established Rayat Shikshan Sanstha in Satara which later spread all over western Maharashtra.

Dinkarrao Jawalkar's *Deshache Dushman* came out in 1925. He branded Tilak and Chiplunkar as traitors and criticised Tilak's aversion to non-brahmin representation in the state legislative council and his discouraging attitude towards compulsory education. He alleged that the brahmins drowned Tukaram (1598-1649), a kunbi saint, along with his book of couplets in a river. He called brahmins beasts, who threw the stones at Savitribai, wife of Phule and the first woman teacher of the first girls' school in Pune. He demanded that all brahmins should be expelled from legislative councils, local bodies and services. Jedhe and Jawalkar were persecuted and convicted by the lower court for casting aspersions on Tilak. Ambedkar fought their case in the upper court and got them acquitted. But, when Ambedkar led a satyagraha at Mahad in 1927, Jedhe and Jawalkar demanded that no brahmin be allowed to participate in the satyagraha. Ambedkar declined their condition, explaining that he was against brahmanism but not against the brahmins. In 1926 the non-brahmin leaders closed the doors of their party to the brahmins. Although the membership was open to all non-brahmins, deshmukhs and patils were predominant in the party.

SOCIO-POLITICAL SCENE OF VIDARBHA

Vidarbha region was incorporated in Maharashtra in 1956. Compared to the intemperate experiences of brahmanism in the Deccan, brahminism in Vidarbha was moderate, the reason being neither the prince nor the prime minister of this region was a brahmin. Nagpur was the capital of the

New Book from	MD	Publishers of the Humanities, Natural & Social Sciences
SOCIOLOGY IN LATIN AMERICA		
Editor Man Singh Das		
The purpose of this book is to introduce the reader to the study of population, rural and urban societies and gerontology in various less developed and developing countries of Latin America. The book analyses the different stages of development and social changes occurring in these countries. This book is a valuable source for the social scientists, interested in the field, particularly of Latin America.

Bhoslas, the maratha kingdom of Berar and Vidarbha. It was established in 1743 usurping the throne of the Gond Raja of Deogarh. But the brahmins were in the administrative services of the Gonds and the Bhoslas. David Baker states:

The Bhoslas laid the foundations of brahmin dominance by establishing them on land and appointing them in their administrative services. British rule enhanced their position further by creating new economic opportunities, besides opening schools and colleges through which they could enter the professions and government service. Utilisation of these opportunities, combined with the brahmins' social prestige, placed them in a commanding position amongst the urban middle classes by 1918 [Baker 1979:15].

Nonetheless, the brahmins do not outnumber the maratha-kunbis as vatandars. In Yavatmal district, for instance, of the 1,397 vatandars, there were 301 brahmin vatandars and 830 maratha-kunbi vatandars. Moreover, commerce and financing were under the control of the immigrant marwari-gujars of the north [Diwan 1980:235-36]. Even after independence the Akola district Congress committee was under the control of marwaris suggesting that the marwari group was the leading political force in the Vidarbha Congress organisation [Carras 1972:133].

During the Tilak-Gandhi era (1900-1937), Dadasaheb Khaparde, M S Aney, N B Khare, B S Moonje, M V Abhyankar, Moropant Joshi, Tapaswi Paranjape, K V Brahma, Vamanrao Joshi and Acharya Dada Dharmadhikari, were prominent amongst the brahmin nationalists of Vidarbha. Jamnalal Bajaj and Brijlal Biyani, both marwaris, joined the Congress around 1920.

The satyashodhak movement was active in western Maharashtra. The non-brahmin leaders of Vidarbha were attracted towards it. They, too, protested against the brahmin supremacy, especially their priestly status. All India Maratha Education Conferences were held at Amraoti and Khamgaon in 1909 and 1920 respectively. Both were presided by Shahu of Kolhapur. In the 1920s, G A Gawai, a leading mahar from Amravati, was awakening the untouchables regarding their deprived status. He was nominated to the legislature in 1920. Raosaheb Bajirao Nimbalkar, a landed maratha and the tahsildar of Katol, sponsored an anti-brahmin periodical *Bhawani Talwar*, published from Narkhed in Katol taluka. The elections to the local bodies and the legislature in 1924-1926 strengthened the non-brahmin activities. Raibahadur K S Naidu, a non-brahmin leader, started *Brahmanetar*, a periodical urging non-brahmin communities to capture all local and self-government institutions, government services and honorary posts in proportion to their numerical strength. In 1925, marathas of

Amraoti started a periodical named *Maratha Samachar*. All these developments helped the non-brahmin leaders to win more seats in the legislative council and in the local bodies throughout the Berar. The 1931 Census noted that the strength of brahmin legislators declined from 29 to 17 in the third council and that of the marathas rose from six to nine. Panjabrao Deshmukh, a wealthy maratha with a doctorate from Oxford University, joined the non-brahmin politics and became president of the Amravati Municipal Committee in 1928. In 1930, he got elected to the legislative council from Amravati. Uttamrao Itikar, Shyamrao Gund, Anandrao Meghe and Nanasaheb Amrutkar of Amravati district, Sampatrao Deshmukh and Pandharinath Patil of Buldhana district were other militant non-brahmin activists [Diwan 1980:237]. The Hindi politicians exercised an hegemony over Marathi politicians in the central provinces and Berar Congress. After 1934, the non-brahmin leaders, Panjabrao Deshmukh, N R Deshmukh, N Y Deotale, G R Pradhan and T J Kedar joined the Congress *en masse*. In wake of Gandhi's assassination, the non-brahmins attacked brahmins leading to the migration of the latter to towns and cities. Nevertheless, the politics of Vidarbha was dominated by the brahmin Shukla-Mishra-Khedkar clique, till the formation of Maharashtra in 1956. Yet, as compared to the Deccan, antagonism between non-brahmins and brahmins was not sharp. The scheduled castes of Vidarbha were advanced in school and college education [Chitnis 1974:91].

Thus the non-brahmins launched a movement against brahmin dominance and were successful to lower the strength of brahmins in the legislative body and local boards. During the Gandhi era, non-brahmin leaders joined the Congress and gradually captured the positions of power. The earlier truth-seekers became power-seekers. Commenting on the downfall of non-brahmin movement, Ambedkar said:

Firstly, they had not been able to realise exactly what their differences were with Brahmanical Sections. Though they indulged in virulent criticism of "Brahmins", could any one of them say that those differences had been doctrinal? How much brahmanism had they in them? They were "Namams" and regarded themselves as second class brahmins. Instead of abandoning brahmanism they had been holding on to the spirit of it as being the ideal they ought to reach. And their anger against brahmins was that they (the brahmins) gave them only a "second class degree" [Das 1963:88-89].

The increasing atrocities and discriminations against the dalits in the post-independence period indicates that brahminism still has its hold amongst the non-brahmins.

III Brahminism in Marathas

The non-brahmins are known for their attacks on minority communities. They attacked the brahmins when Mahatma Gandhi was assassinated. In 1974 and in February 1986, the marathas attacked the neo-buddhist locality and destroyed their belongings in Phaltan. In 1978, on the issue of the renaming of Marathawada University the dominant castes brutally attacked dalits in all the seven districts of Marathawada. Despite the large-scale violence, the then chief minister, Sharad Pawar did not issue the order to shoot at the individuals stoking the Marathawada violence while the order to shoot-at-sight was issued on the dalits in Nagpur [Gavan 1978]. Even the prominent and acknowledged leader of the marathas, Yashwantrao Chavan, did not come forward to condemn the violence and terminate it. On August 11, 1991, a carnage took place in Gothala village in Ahmadpur taluka of Latur district in which two mahar brothers were beaten to death in a mob attack. On August 16, 1991, Ambadas Savane, a mahar, was stoned to death by devotees belonging to the intermediate castes.

Moreover, anti-dalit attitudes are evident at institutional levels. According to the Zilla Parishad and Panchayat Samiti Act of 1961, zilla parishads and panchayat samitis should spend 15 per cent of their income on the welfare schemes for the backward castes. But the fact-finding committee appointed by the state government in 1976 pointed out that 36 panchayat samitis had spent nothing and other samitis had spent a partial amount on it.

Co-operative institutions are a major avenue of employment in rural Maharashtra. The Maharashtra government issued orders in 1977 and 1981 promulgating 34 per cent job reservation in co-operative institutions. But some District Central Co-operative Banks challenged the order in the Bombay High Court. The court upheld the order; yet, the backlog remains unfulfilled in many co-operative institutions. As regards the 24 per cent reserved posts for scheduled castes, scheduled tribes, denotified tribes and nomadic tribes, 43,294 posts of Class I to IV, services in various state government departments were not filled as on February 2, 1990. Further, since the general administration department of the state government did not collect information on 10 per cent reserved posts for the other backward classes, those figures are not known. The reasons as to why such a huge backlog of reserved posts remains was not mentioned.

Recently, the intermediate castes are getting attracted towards conservative political parties such as Shiv Sena and the Bharatiya Janta Party. As a result, 52 Shiv Sena candidates and 42 BJP candidates got

elected in the 1990 assembly elections. Many marathas and the ORCs contested elections on the tickets of these conservative parties and got elected in 1990 assembly and 1991 Lok Sabha elections. The Maratha Mahasangha founded in 1980 by Annasaheb Patil, a maratha union leader of porters in Bombay and a close associate of Y B Chavan and Sharad Pawar, objected the government's policy of protective discrimination based on caste criterion. Regular meetings and conferences of the maratha mahasangha help to strengthen the caste feeling and serve the economic and political interests of the community. When the former chief minister, Sudhakar Naik, a banjara, accepted resignations of 11 ministers belonging to Sharad Pawar's group and dropped some of them from his new ministry, Annasaheb Patil remarked in a public meeting held at Nanded that the banjara chief minister had dropped some maratha ministers in the state of marathas. The Mahasangha congratulated Vasantdada Patil, the former chief minister, for granting permission to medical and engineering colleges on non-grant basis. These colleges accept huge amount of capitation fees during admissions. Shashikant Pawar, the president of the Mahasangha, condemned the government publication of Ambedkar's 'Riddles in Hinduism'. All these facts indicate the brahminical dominance over the marathas.

The politics of the maratha elite in joining the Congress during the Gandhi era and recently, the conservative parties, is aimed solely at maintaining power. They are pragmatic, rather than ideological in their approaches to secular matters, and by hook or crook acquire power to multiply economic and educational advantages and thereby various positions in the power structure. Jedhe and Jawalkar, leaders of the non-brahmin movement, joined the Congress in the 1930s. Jedhe was elected to the central legislative assembly in 1935 and became president of the Maharashtra provincial Congress committee in 1938. Y B Chavan joined the Congress in the 30s and became minister in 1952. In October 1956, he became the chief minister of the bilingual Bombay state. After his induction to the union cabinet as defence minister in 1962, Vasant Naik became the chief minister of the state. Although Vasant Naik, a rich banjara farmer, remained chief minister for a long period, he frequently consulted Y B Chavan. Further, under the dominant leadership of Vasantdada Patil and Sharad Pawar the hegemony of the marathas has strengthened. Kochanek has pointed out the role of caste in Maharashtra Congress:

In Maharashtra, including Bombay, 16 per cent of the Congressmen were brahmins and 66 per cent were non-brahmin marathas. This accounts for the charge made in 1962 that all the District Congress Committee

Presidents and Secretaries in Maharashtra were marathas and that 75 per cent of all Congress candidates in the 1962 general elections were also of this group [Kochanek 1968:355-56].

A study on the Satara zilla parishad elections held in May 1962 revealed that the maratha caste was in firm control of the district through the interrelationship of co-operatives and land ownership [Shrader and Joshi 1963:146-51]. A study undertaken in 1963-64 observed a maratha bias in Poona municipal elections of 1962. Only two of the 10 brahmins were elected as against 11 of the 25 marathas [Rosenthal 1970:360-61]. A study of the panchayat raj leaders of Satara, Aurangabad and Akola districts carried out in 1967-68 revealed that the marathas constituted 77.30 per cent of the total sample of leaders [Sirsikar 1970:40]. Anthony Carter mentions that 22 of the 30 offices in Girvi, a large village in Phaltan taluka and 85 of the 144 offices

in the Phaltan taluka of Satara district, were held by the marathas. A survey of 730 villages from five districts of Maharashtra revealed that the marathas control key positions in the panchayat samiti and zilla parishads [Lele 1992:125]. Thus the maratha dominance at grass roots level is instrumental in securing support of the local elites to win state assembly as well as Lok Sabha elections.

Besides the dominance of the marathas, Y B Chavan and Sharad Pawar adopted the strategy of alliance with other parties. The alliance with the Republican Party of India (Gaikwad and Gawai groups) and Bharatiya Republican Party (Athawale group) has proved useful to the Congress. In 1990, Sharad Pawar co-opted a militant dalit, Ramdas Athawale, in his ministry. In December 1991, the then chief minister, Sudhakar Naik split the Shiv Sena by incorporating Chhagan Bhujbal in his cabinet. The move not only helped to

CALL FOR PAPERS

INTERNATIONAL ECONOMIC ASSOCIATION

Session on Gender and Development [full day]

Organizers: Bina Agarwal and Nancy Folbre

The XI World Congress of the International Economic Association will be held in Tunis, Tunisia, from 18-22 December, 1995. We invite papers on all aspects of gender and development, whether institutional or macro-economic in orientation. The following topics are of special interest: feminist theoretical perspectives on development and social policy; analysis of property rights; globalization, women's work, family structures and poverty; environment and sustainable development; conceptual issues relating to gender-based collective action; economic reforms. Cross-country, including North-South, comparative analyses are encouraged, and interdisciplinary approaches are welcome.

LAST DATE FOR RECEIPT OF PAPERS: May 15, 1995. Please try and submit well before the deadline. Selection of 8-10 papers will be made by June 30, 1995, and decisions conveyed shortly thereafter.

Please send one copy each to the first three addresses below, and if possible a fourth to the IEA Paris office. (Alternately, you may send one copy to Nancy Folbre by May 1, with a request for forwarding to the other three). Please provide fax, telephone and e-mail information, where possible.

FRANCE

increase the strength of the Congress legislators but also weakened the support base of Shiv Sena. Moreover, the strategy of showing favours to the weaker sections by providing jobs, rendering monetary help or using state or any other local office to sanction a loan, is used for vote-gathering. Thus, the Congress has adopted strategies of alliance, co-optation, splitting the opposition and bestowing favours on the depressed, to strengthen its support base.

IV

Accretion of Resources

In 1948, after the passing of the Bombay Tenancy and Agricultural Lands Act and the assassination of Mahatma Gandhi, many brahmins left villages and their lands were transferred to the maratha and other intermediate caste tenants. Although caste wise data on landholding is not available, Carras reports in her study of 160 district councillors that a respondent owned 84.5 acres of land on an average (1972:42). In Girvi of Phaltan taluka, 74.5 per cent of the wet land and 72.4 per cent of the dry land was owned by the marathas who comprised 56.9 per cent of the total village population in 1966-67 [Carter 1975:70]. In the Kisan Co-operative Sugar Factory of Kopergaon in Ahmadnagar district, 60 per cent of the shareholders were marathas [Baviskar 1980:52]. As a result, during 1961-63, 10 of the 15 directors of the Kisan Factory were marathas. Besides, in a sample of 50 villages from Marathwada, 51.48 per cent landholders were from maratha caste, holding 50.22 per cent of land [Mandavdhare 1989: 110]. These figures indicate that in the post-independence period a large number of maratha-kunbis became landowners.

In the post-independence period, the marathas have dominated the co-operative, education and panchayat institutions. The dominant rich marathas who have political and administrative contacts act as patrons extending help in matters of employment, finance, benefits of government programmes and providing a few positions in the local bodies. The dependents who receive help from the dominant leaders obviously feel obliged and become subservient to them.

The most important arm of the state political power are the co-operative institutions. Baviskar notes, "The resources of co-operatives are used to win elections to zilla parishad, assembly, and parliament, and also to create educational institutions and strengthen the Congress Party organisation" (1980: 181). The state co-operative bodies such as the Maharashtra State Co-operative Bank, the Maharashtra Rajya Sahakari Karkhana Sangha and the State Co-operative Marketing Federation

were under the command of Vasantdada Patil, and after his death, are under the control of Sharad Pawar.

After occupying key positions in the state power, marathas use it to generate additional economic base by setting up a number of co-operative units of sugar, dairy, bank, credit society, cotton and oil mills. In Maharashtra state, 25,000 co-operative institutions have been established. One of the reasons for the development of co-operatives in Maharashtra is the financial support of the state government. Another major credit disbursing institution is the Maharashtra State Co-operative Bank.¹ Over the years the state government has contributed a total of Rs 419.46 crore as share-capital and loans to the sugar co-operatives, but the total repayments by the factories have been barely Rs 69.63 crore. In spite of such a huge backlog, Sharad Pawar mentioned at a recent statewide meet of sugar co-operatives that the state government would offer Rs 150 crore towards the takeover of the Rashtriya Chemicals and Fertilisers by the co-operative sector.²

The growth of co-operative institutions in Maharashtra is phenomenal. In 1992-93, 99 sugar factories were operating in the state, of which 70 factories were operating in western Maharashtra alone. During the same year, there were 26,880 co-operative societies in the state. In 1991, there were 43 branches of Maharashtra state co-operative bank. It is the biggest co-operative bank in Asia, having deposits worth Rs 2,094 crore as on June 30, 1991 and working capital of Rs 3,101 crore in 1990-91. In 1991, the total branches (including head office) of the district central co-operative banks were 3,147. The district central co-operative banks had working capital Rs 4,764 crore as on June 30, 1991 and advanced loans worth Rs 4,690 crore in 1991. In 1991, 125 co-operative spinning mills were in operation and 44 out of the 212 distillery plants in India have been set up in Maharashtra. At the end of June 1981, 4.10 lakh employees were working in the co-operative sector, amounting to 12.50 per cent of the total employment in the state.

The apex co-operative bodies and most of the co-operative units in the state are under the command of the marathas. Shivajirao Giridhar Patil, a close supporter of Sharad Pawar, is the chairman of the national confederation of co-operative sugar factories and was elected president of the organisation of world sugar producers as well. Prakash Patil, the son of Vasantdada Patil, is the chairman of the state co-operative sugar factories' federation. Having huge sums at disposal, Prakash Patil recently decided to launch two private sector projects, namely, Rs 240 crore alcohol-based plastic material

plant and a Rs 20 crore fertiliser plant near Sangli.

It is usually reported that the chairman of sugar co-operatives have remained in their positions for more than two decades. For instance, in six of the nine co-operative sugar factories in Kolhapur district, men who had taken initiative in setting up co-operative sugar factories have been the chairman right from their establishment. Of course, all these chairmen did not belong to the marathacaste. The chairmen of Warana and Panchaganga factories belonged to the lingayat community. The sugar barons have set up private trusts for various welfare and developmental activities. The donations are collected from the shareholders of the co-operative sugar factories and this practice is not objected by the state government. In this way, the sugar barons have generated multiple sources of raising millions of rupees for their political gains.

The marathas are generally known as cultivators and the jains and lingayats as traders. But in post-independent India, many jains and brahmins have become entrepreneurs and since last two decades marathas have also started to enter into the entrepreneurial and trading activities, using their political and administrative linkages. In 1981, 613 of the total 993 entrepreneurs in engineering units of Kolhapur belonged to maratha caste [Bhanushali 1987: 43].

In pre-independence period, non-brahmin leaders realised the importance of education. Shahu took lead in this direction. Karmaveer Bhaurao Patil, a jain, followed him and established the Rayat Shikshan Sanstha at Kale in 1919. According to the sanstha's annual report of 1989-90, the sanstha has 520 educational institutions from pre-primary to degree college level, and 6,628 of its 13,734 employees were from maratha caste. N D Patil, a maratha, is the chairman of the sanstha. In 1954, Bapuji Salunkhe founded Shri Swami Vivekanand Sanstha. There are 4,301 employees of the sanstha. Branches of Rayat and Vivekanand sansthas are spread throughout western Maharashtra. The Marathawada Shikshan Prasarak Mandal and the Shivaji Shikshan Sanstha have started many educational institutions in Marathwada and Vidarbha respectively. The castewise figures of the employees in these institutions are not available, but the percentage of maratha employees is said to be more than that of the Rayat Shikshan Sanstha.

Since 1983 the state government has adopted a policy of permitting non-grant colleges for medical, engineering and education courses. Interestingly, in 1984 by making an amendment to the university act, the university right to grant permission to start a private college has been transferred to the state government. D Y Patil, Patangrao Kadam and Kamal Kishor Kadam

could become education entrepreneurs because the state power backs them. D Y Patil who was a member of the Maharashtra state legislative assembly from 1967 to 1978, got advantage of his close relationship with Vasantdada Patil. Kamal Kishor Kadam and Patangrao Kadam are ministers in the present state cabinet. In Maharashtra public service commission, three of the six members of the commission belong to maratha caste, and one of them is the chairman.

Thus, in pre-independence period, the non-brahmin movement, and in post-independence period, the politics of co-operatives, have contributed to the dominance of vatandar marathas in the power structure of Maharashtra.

Notes

[The author is grateful to V S Kadam, professor of maratha history of the Shivaji University, Kolhapur, for suggesting readings and useful comments on the earlier draft of the article. The author also extends his thanks to M N Panini for his comments and suggestions which helped in revising the earlier draft.]

- 1 M N Srinivas defines the dominant caste as the one which "... preponderates numerically over the other castes, and wields preponderant economic and political power. A large and powerful caste group can more easily be dominant if its position in the local caste hierarchy is not too low" [Srinivas 1955:18].
- 2 The marathas are largely concentrated in western Maharashtra and Marathawada while the kunbis are predominant in Vidarbha region of Maharashtra
- 3 The present Maharashtra state comprises Bombay, Pune, Marathawada and Vidarbha as its divisions. In 1960, Gujarat was separated from the Bombay state and Marathawada and Vidarbha which were parts of the Hyderabad state and the central provinces respectively joined to form today's Maharashtra.
- 4 According to B R Ambedkar, brahmanism means 'the negation of the spirit of liberty, equality and fraternity.' Further, he elaborates: 'The effects of brahmanism were not confined only to social rights such as interdining and intermarrying. It denied them also the civic rights. So omniscient is brahmanism that it even affects the field of economic opportunities' [Keer 1971:303-04]
- 5 An experience of Tatyasaheb Kore, lingayat, is that, in 1952, he had collected a share-capital from the farmers for setting up a co-operative sugar factory but since the co-operative bank of Bombay declined to extend its support for investment he had to give up his plan and had to refund the collected money to the farmers, who had contributed to set up the factory.
- 6 Since the union government had no plan to dilute the holdings, Sharad Pawar's suggestion of acquiring the shares worth Rs 500 crore of the Rashtriya Chemicals and Fertilisers did not materialise (*The Times of India*, July 6, 1993).

Jawahar Rozgar Yojana: An Assessment?

Jos Chathukulam
V K Kurien

M NEELAKANDAN's article 'Jawahar Rozgar Yojana: An Assessment Through Concurrent Evaluation' (*EPW*, December 3, 1994) is a commendable attempt to examine to what extent the programme objectives have been achieved, the deviations, if any from the guidelines; with an overall assessment of the workers by making use of the data of the concurrent evaluation conducted in 1992. Here we are attempting (1) to review Neelakandan's findings; and (2) to assess qualitative aspects of the findings and the acceptability of the concurrent evaluation data based on our empirical evidence and in depth field experience. (See Jos Chathukulam and V K Kurien, 'Participation of Rural Development and Delivery System: A Case Study of Jawahar Rozgar Yojana in Kerala', Centre for Rural Management, Kottayam (mimeo)).

Based on the objective of poverty alleviation, the government of India launched the biggest wage employment programme the 'Jawahar Rozgar Yojana' (JRY) in April 1989 merging the two ongoing programme of NREP/RLEGP. The main objectives of the programme are generation of employment for the unemployed and underemployed men and women in rural areas living below poverty line, creation of community assets and the over all improvement in quality of life under the programme. All rural works which resulted in the creation of durable and productive community assets can be taken up under JRY. The expenditure for the programme is shared between the centre and the state in the ratio of 80:20. The funds are made available by the DRDA of each district from the centre and distributed to the village panchayats on the basis of the SC/ST population. The village panchayats have the power to plan and execute the works as per the guidelines of JRY.

Since JRY is an employment-oriented programme, 60 per cent of the total expenditure of the works to be spend on wages and the rest can be utilised on non-wage component. Contractors are prohibited in the execution of work and preference should be provided to SC/ST and bonded labour and women. The notified minimum wages are ensured and there should not be any gender discrimination in the wages.

Though different types of community assets are created, the construction of rural link roads attained more attention. About 45 per cent of the expenditure was incurred for this purpose at the national level. In some states the percentage is higher. For example,

in UP it is 71.66 per cent. Neelakandan has pointed out that the main reason for this high percentage is the keen interest of the panchayat members in improving transport and infrastructural facilities. However, he has not probed why the panchayat members are so keen on the creation of rural link roads? We have observed that there are a number of reasons: firstly, the response of the rural poor to a road work is relatively more and it evokes more people's support and attention. This is largely exploited by the panchayat members. Secondly, there is greater opportunity for corruption and malpractices in road works. Thirdly, the contractor, or nominees are still operating as 'parasites' in the programme and their influence and support among the panchayat members is another reason for the high percentage of road works. And fourthly, the rural poor has only very little knowledge about the technicalities of a road work and their interference in the work is also negligible. This aspect is largely exploited by the panchayat/contractor. Last but not least, by keeping an eye on the coming election, the panchayat members in order to get popular support prefers road works irrespective of its quality and utility.

At the national level the wage had a share of 53.46 per cent as against 60 per cent. The ratio was satisfied only in Assam (83.09 per cent) and it is very low in Punjab (20.25). The main factor behind this may be because of the low minimum wage rate in some states but in other states this comparison could not be reliable and more empirical evidence is required to substantiate this factor.

The JRY does not allow contractors to execute the works. The study shows that at the national level the involvement of contractors is very low at 4.25 per cent. This figure is definitely an underestimation and contradictory to the field situation. However, the study reveals that in Karnataka the involvement of contractors is around 20 per cent. The author has nothing to say about how the contractors emerged on the JRY scenario in Karnataka where the panchayat structure was very strong during the survey period. The logic behind this is that the contractors alone have the tools, implements and technically skilled persons and the expertise for various works. The concurrent evaluation data shows that the involvement of contractors was found to be less than national average in Kerala. Contrary to this, our study in Kerala shows that where there is a high percentage of road construction

work, there the involvement of contractors will also be high.

Neelakandan further points out that the sarpanch, village level committee and panchayat secretary execute the work. However, our inquiry finds that even though in some cases village-level beneficiary committees have been constituted, the involvement of the sarpanch/president and panchayat secretary is considerably low. In the initial stages of the programme some of the presidents venture to execute the work sincerely but most have faced severe loss and humiliation due to the undermeasurement of work by the technical personnel from block/DRDA and finally they are totally kept away from the execution of the JRY work. Further, since panchayats are not equipped technically and the entire technical control still rests with the block/DRDA, the panchayat president/secretary do not dare to venture to take on JRY works. Also by the techniques of undermeasurement of work and other administrative harassment the engineering personnel of the block/DRDA proved that JRY work can be executed only by contractors and not by beneficiary committee, president, members and secretary of the panchayat. Further, even if the beneficiary committee convenor had been taken for any works, the ultimate execution was done by local contractors. Thus a powerful lobby is acting in the system. This aspect could be found only with the help of case studies and case histories of JRY administration in the panchayats, since there are lot of limitations in the JRY schedule itself.

Awareness-building among the rural people and participation of local people, non-governmental organisations and proper propaganda about the work by controlling the involvement of technical staff of block and a strict following of the manual, etc, bring good results in keeping the contractors in check. The involvement of the voluntary technical force as in the case of land army experience in Karnataka may be the right solution.

The employment generated for SC/ST and other weaker sections have largely been met. At the national level SC/ST comes 53.66 per cent and landless only 38.28 per cent. The study shows that the participation of SC/ST or landless labourers' performance is not discouraging. But the participation of women is only 20.02 per cent which is less than the stipulated minimum. This figure is very low in less developed states like UP and Bihar and there is no valid reason for this low percentage of female participation in these states where incidence of poverty is high. The author does not address the question, why poor participation of women in JRY? This very low profile of the women beneficiary can be rationally correlated with

the high percentage of road works. We have examined this aspect in detail. Participation of women is very low because (a) as mentioned, a road work requires large numbers of semi-skilled person, and (b) the road work is definitely harder when compared to other works. This prevents women from engaging in road works.

Another aspect which has partially prevented the entry of women workers is the high involvement of the contractors in the work. In order to get more profit and speedy advancement of work, these contractors deliberately avoid women workers. Also, since only few days of employment are available under JRY annually, it is very difficult for women to contest with the men. The lower social mobility of women when compared to men is another aspect which brings down the percentage of women workers. Moreover, male-dominated structures in village panchayats, blocks and DRDA fail to empower women and have neglected this aspect. Further the awareness of the programme is definitely low. A study in Kerala shows that the majority of the JRY workers are not aware of the programme, and its details. The net result of these factors work against women in getting employment under JRY.

Payment of wages and maintenance of muster rolls are other important issues which need critical examination. The JRY stipulates notified minimum wages in each state and equality in wages for men and women. The evaluation study shows the wages paid are more than or equal to the minimum wages in most states. The wages for women is much less and not even equal to the minimum wage rate in some states like Karnataka. Even in a socially developed state like Kerala this discrimination is apparent. In Kerala Rs 27.34 for women as against Rs 34.78 for men, and the minimum wage rate is only Rs 27. A similar situation was found in some other states also. At the national level 62.71 per cent workers opined that the JRY wage rate is not acceptable to them. Also, the payment of the wages are irregular in most states.

Neelakandan does not find out why there is a marked difference in the notified minimum wage rate and the actual wage rate. It is obvious that the notified minimum wage rate and the prevailing wage rates are not identical in most of the states. The latter is higher, but the JRY manual restricts the workers with the notified minimum wage rate. But the real situation in the rural scenario is that the workers are not aware of the notified minimum wage rate. The wage differentiation between male and female may be explained in terms of the difference in the nature of the work and the division between skilled and unskilled. The general psychology of the contractors are also not in favour of providing equal wages. Further, the male dominance and the unorganised

labour situations among women also act against them.

The difference between the notified minimum wage rate and the local prevailing wage rate and the strict instructions in the guidelines leads to malpractices in the programme. Evidently, the muster rolls become fabricated and the wage:material ratio of the works also become unreliable.

Another important finding is that more than 50 per cent of the workers at the national level express their unwillingness to accept foodgrains as a part of wages. However, the survey did not seek the reason for their unwillingness to have foodgrains as part of wage. The probable reason as pointed out by the author is the non-availability of foodgrains at work site and the distribution of low quality foodgrains.

The muster roll is an important document for assessing the progress of the employment generation and payment of wages, etc. At the national level 84.15 per cent muster rolls were found to have been maintained. Statewise analysis shows that muster rolls were not maintained in Tamil Nadu. In other states like Kerala and some other north-eastern states the position was not good.

The figures which related to the preparation of muster rolls and the data given for the wage:material component in Neelakandan's article are not at all reliable. Because since there is the strict instruction for the provision of notified minimum wage rate, the contractor/nominee who is in real charge of the execution of the work and the custodian of the muster rolls inflates the number of workers to make parity with the prescribed wage rate. Thus the wage:material ratio also may be adjusted accordingly.

The survey revealed that on an average a JRY worker could get 3.81 mandays of employment during the last 30 days preceding the date of survey. Other members of the family get another 1.34 days of employment. Therefore, in all, the JRY provided an average of 5.15 days of employment during the reference period at national level.

This does not mean a family will get at least this many days of employment every month or throughout the year. A general feature we have seen is that when one major work (that may be road or any other work) ends in one area, there may not be any more work for some years. This wide gap in the employment has not been taken into consideration although the author hopes that more employment can be generated in the coming years through a hike in the allocation of funds to panchayats and through the introduction of the employment assurance scheme (EAS).

The study revealed that after completion of the work the line department has not taken up works for maintenance. It pointed out that 17.5 per cent of the assets are not maintained by any agency. Even though 10 per cent of the funds are set apart in the guidelines for

maintenance, this aspect is deliberately ignored by the panchayats.

The above percentage is not a reliable figure because the panchayat authorities will not disclose the real situation of the maintenance, and before an enquiry, they will always provide a positive answer. The fact is that in Kerala there is no maintenance of assets because panchayat members are only interested in creating new assets. They will get more people's support through the construction of a new work rather than the maintenance of an old work. The workers are generally satisfied with the programme. 97.12 per cent of the workers opined that the assets created was useful to the poor people. However, only 81.32 per cent opined that the assets meet the felt needs of the community.

The survey shows that only 39 per cent of the panchayat heads are trained. Even this figure may be over-estimated, since there is no proper institutional support to train the panchayat presidents regarding this programme and even the JRY manual is not found available in one-third of the panchayats. Also the author did not try to find out why majority of the panchayat presidents are not trained properly. One of the main reasons for this is that the programme is still under the control of the bureaucrats and not with the elected representatives of the panchayats. Another reason is that bureaucratic attitude towards the programme is not conducive to providing or disclosing all the details in the programme.

The JRY programme envisages the provision of employment to families living below poverty line. But 56.96 per cent of workers belonged to non-poor family. The author suggests that since the panchayats do not possess records with regard to families below poverty line, the below poverty line (BPL) survey list must be made available to the panchayat and clear-cut guidelines should be provided to the panchayats to avoid these types of situations.

One of the major limitations of the article is that it is based on data which is collected through a centrally-structured schedule and a quantitative assessment of the programme. There is little scope to incorporate local variations and issues in the JRY administration. The schedule does not provide enough scope for case studies or case histories about panchayats by using a socio-anthropological parameters. Since the article is based on the data collected from the panchayat records and muster rolls which are manipulated in several respects the conclusion made in the article itself is questionable. Further, it must be supported or rejected with other empirical and qualitative data based works. For that one may need a serious reference and bibliographical support which is completely absent in this paper. This may be due to the lack of such empirical works.

UNIT PLAN

*For that special woman, 18 years age onwards:
your daughter, sister, niece, grand-daughter or anyone you love. Even yourself.
An ideal wedding gift with special gift tax exemption of Rs 1 lakh.*

HIGHLIGHTS

- 30 year plan-sale open at par
- Minimum investment of Rs 5000 and in multiples of Rs 1000 thereafter. No upper limit
- Any individual or HUF can invest in favour of a female, 18 years and above. Also any Indian female individual who has completed 18 years of age can invest for herself
- No dividend for the 1st year. Annual dividend from 2nd year onwards, eg., if application is accepted in August '94, then dividend will be paid from July '96 onwards
- Also, facility for reinvestment of dividend
- Withdrawal allowed anytime after three years at NAV-based repurchase price
- Scope for capital appreciation
- Income from this plan enjoys tax benefit up to Rs 10000 under overall limit of section 80 L
- Normal gift tax exemption up to Rs 30000 and up to Rs 1 lakh if gifted to a dependent female at the time of her marriage

UNIT TRUST OF INDIA

For your better tomorrow

All investments in mutual funds and securities are subject to market risks and the NAV of schemes may go up or down depending upon the factors and forces affecting securities market. Past performance is not necessarily indicative of future results. Grihalakshmi is only the name of the scheme and does not in any manner indicate either the quality of the scheme, its future prospects or returns. There can be no assurance that the Plan's objectives will be achieved. Please read the offer document before investing.

February 18-25, 1995

Electronics under Liberalisation

With economic liberalisation there has been a remarkable increase in the total number of foreign collaborations in the electronics industry. Public sector units have been actively seeking collaborations. A study, based on enterprise-level data, of the direction of change in the technological capabilities of public sector units which have imported technology. **M-13**

Until 1991-92 there had been virtually no policy support for the software sector. Though the government has taken some positive steps since then, the general perception of the software industry continues to be that it will rapidly attain international stature without any policy support. An examination of the behaviour of software exports and some policy suggestions. **M-19**

Beyond Colonial Crumbs

The flawed representation of the Dravidian movement in the influential works of faction theorists of the Cambridge school is exposed by the fissures and slippages of their own texts. An alternative way, substantially based on the debates around Habermas's concept of 'public sphere', facilitates the writing of the Dravidian movement's history from the vantage point of those who are disempowered through inferiorised identities. **385**

Unfinished Task

The Tax Reforms Committee had laid out a two-pronged strategy to improve the yield of income tax: widening the tax base combined with moderation of rates on the one hand and strengthening tax administration on the other. Several measures have been taken to implement these recommendations, but much still remains to be done. **380**

Monitoring Food Security

A global inventory of food security and nutrition monitoring systems indicates that policy-makers in developing countries have found many of the traditional indicators laborious and expensive to collect, difficult to analyse and interpret and of limited value for early warning and targeting. An attempt to develop and test alternative indicators with reference to the Indian semi-arid tropics. **392**

Export Myth

The myth of the international competitiveness of the Indian hand-knotted carpet industry rests on, apart from the well documented abuse of child labour, an arrangement where raw material cost is depressed by preventing the raw wool producer from recovering his labour cost and where the social cost of depreciating grazing lands is not reflected in the cost structure. **360**

Technology Policy

The new policy regime in regard to foreign investment and technology import is likely to intensify the technological polarisation between the large and small sectors and impede the design and innovation capabilities of in-house R and D. **M-2**

Culture and Globalisation

In the absence of an adequate recognition of the cultural dimension, the agenda of the World Summit for Social Development in Copenhagen next month is incomplete and ineffective as far as the developing countries are concerned. The National Report of India is no better. **374**

Measuring Efficiency

Extant comparative evidence points to no significant difference in the performance of private sector and state-owned firms. What is the true picture? **M-25**

Fractured Polity

The assembly election in Bihar has laid bare the state's fractured polity. Every party is torn, every organisation is fragmented, every leader is suspect. **359**

Focus on Manufacturing

To strengthen competitive advantage in the new borderless world we are moving towards requires, besides alterations in government policies, changes in the attitude of company managements to the centrality of manufacturing as a discipline. **M-33**

LETTERS TO EDITOR

Nripen Chakravorty

THE piece of 'CPI(M): Note of Dissent' in your columns (January 21) was singularly deceitful about the CPI(M) and its senior leader Nripen Chakravorty. It contains a string of falsehoods to convey the impression that the party is out to persecute its own politburo member. Your correspondent falsely alleges that Jyoti Basu had "publicly declared that Chakravorty had been retired because of his old age from the politburo of the party". Actually Jyoti Basu had told the press on December 26, 1994 that Nripen Chakravorty was resting because of his ill health. This is presented by your correspondent, echoing the congenitally anti-communist press of West Bengal, to mean 'ouster' from the politburo and the central committee.

It is well known that Nripen Chakravorty is not attending politburo and central committee meetings since mid-1993 because of his poor health. This is a matter of public record noted in the party's press briefings. Even in Tripura, he has been staying in his room in Agartala and has not been participating in the day-to-day activities of the party state committee for the past year and a half. Despite this well known state of affairs, your correspondent makes a series of insinuations which are frankly scurrilous. Your correspondent manufactures a fallacious story in which Nripen Chakravorty was shifted unnecessarily to an "inaccessible cardiac ward" in the hospital. After his discharge he is supposed to have deliberately not attended the meeting of the PB and CC held in Calcutta. Chakravorty is 91 years old and has neurological and cardiac problems. He requires periodical medical check-ups. He was in Calcutta for this and not to attend the party meetings. He was discharged from the hospital on December 28, 1994. On the same day he fell in the bathroom of the Tripura Bhavan and suffered a bump on his head and had to be put on medication. Some of us went to see him immediately after this accident. To attribute his physical inability to attend meetings as due to some political reason is both perverse and displays lack of sensitivity about a leader who is respected in all circles.

But your correspondent is not satisfied with this concoction about his Calcutta stay. He goes further to allege that back in Agartala, Nripen Chakravorty is "well enough to resume his normal life". Everyone in Tripura is aware of his confined life due to ill health. Being an old revolutionary, despite his frail health, Nripen Chakravorty writes regularly for the party's daily paper and sends his written suggestions and contributions to the party's leading bodies. But to distort this to show that he is 'normal'

in Agartala and 'ill' in Calcutta is to be downright dishonest.

Your correspondent seems to have taken to the practice of the hardened anti-communist columnists in the Bengali press who were earlier vilifying Nripen Chakravorty for his 'stalinist' and 'authoritarian' ways in leading the Tripura party and who are now all praise for his alleged defiance and attack on the party leadership and policies. Neither of these slants will obscure the truth of the matter. The CPI(M) has the capacity to discuss and debate differing views on every aspect of party policies and activities without having to resort to undemocratic practices within the party.

Prakash Karat

Member, Politburo, CPI(M),
New Delhi.

Not Karunanidhi

MY article 'Seduction, Speeches and Lullaby: Gender and Cultural Identity in a Tamil Film' (February 11) has a factual mistake. The film has two lullabies. One of them is written by Karunanidhi. The one I have quoted is not written by Karunanidhi as I have mentioned, but by K P Kamakshi Sundaran, who was a self-educated poet and a theatre-actor. He wrote songs for Tamil films from 1949 onwards and has been associated as a poet and as an actor in films like *Nalla Thambi*, *Parasakthi*, *Or Iravu*, etc. His songs are simple and direct and often have references to Tamil language, social injustice, chaste women, poverty, etc. Like many film lyricists during this period, including Karunanidhi, who used the lullaby form to depict a certain set of values, K P Kamakshi also wrote in the lullaby form. A later lyricist has in fact said

that K P Kamakshi inspired him as much as Bharati or Bharati Dasan.

Malcolm Adiseshiah

I am shocked to learn of the sad demise of Malcolm S Adiseshiah (Nirmal Sengupta, 'A Modest Giant', January 21). I was about to write a letter to him with regard to my research work on human resource development in south Asia which is currently in progress, but fate willed otherwise. I did not know that I would never be able to do so. I have read Malcolm Adiseshiah since my student days, but I could correspond with him only in 1989 when we wrote a long review of my book which was a great encouragement for a new author and later I came closer to him. I often received invaluable comments and suggestions from him on my research studies on economics of education.

Many others with me here in Oxford who knew him very closely are gloomy and depressed to learn of his passing away and share the grief with his family and admirers. We pay our heartfelt homage to the great scholar — a true giant and a big institution in himself. His gentleness, openness and downright good heartedness need not be spelled out. Generations of students, teachers and educational administrators will learn from him. To those who had only encountered Malcolm Adiseshiah in print, the image of penetrating analytical mind coupled with an amazing fund of wide-ranging knowledge needs to be supplemented by the humanity and discipline of the man he was.

Dwindling Saving and Investment

WHATEVER be one's ideological persuasion, there can be no gainsaying the importance of rising domestic saving and investment for a developing country with massive unemployment and underemployment, such as India. The industrialised countries which have attained the mass consumption stage can make do with stagnant domestic saving ratios and niggardly rise in domestic investment rates for long periods (with cyclical upswings and downswings). Continuing increases in consumption augment the size of their domestic markets, while continuous improvement in technology improves capital efficiency and helps to make do with relatively less investment. They can also withstand the ebb and flow of foreign capital. As the experience of east and south-east Asian countries has shown, the developing countries, particularly when they embark on rapid industrialisation and accelerating economic growth, require rapidly growing rates of domestic saving and capital formation, apart from qualitative improvement in investment accompanied by technological upgradation. Almost all the newly-industrialising countries attained incremental saving to GDP ratios of more than one-third in their early phases of development. This reflected two key characteristics: first, dependence on foreign capital was to that extent minimised; and second, the process of industrialisation was not based on consumerism. For capital-scarce societies, these are almost as the *sine qua non* of development.

Against this background, the performance of domestic saving and capital formation in India in recent years should be considered as disappointing, if not alarming. The Central Statistical Organisation (CSO) has just released its quick estimates of national accounts for 1993-94 and advance estimates of real income growth in 1994-95, which suggest that even as the overall growth rate has picked up domestic saving and investment rates have shown a declining trend. Before we take a closer look at these trends, it is necessary to note certain serious data problems. Last year when the CSO similarly released the quick estimates for 1992-93, the size of gross domestic saving was placed at Rs 1,57,186 crore, equivalent to 22.3 per cent of gross domestic product (GDP). This figure has now been revised downwards rather drastically to Rs 1,40,635 crore – a reduction of over Rs 16,500 crore – with the saving-GDP ratio getting reduced to 20 per cent. As a result, given the capital inflow from abroad of 2 percentage points in that year, the rate of gross domestic capital formation has also got revised from 24.5 per cent to 22 per cent. There is an equally serious data problem in the quick estimates for 1993-94. Earlier the Reserve Bank had published, in its Annual Report for 1993-94, tentative estimates which had

indicated striking improvements in domestic saving and investment. The ratio of gross domestic saving to GDP had moved up, according to the RBI's estimates, from 22.1 per cent in 1992-93 to 24.2 per cent in 1993-94 and the level of gross domestic investment was as high as 24.4 per cent in 1993-94 against 24.3 per cent in 1992-93. The latest data from the CSO have now reduced this buoyant scenario to a shambles. According to the CSO, the domestic saving ratio in 1993-94 remained stagnant at 20 per cent and the investment ratio fell from 22 per cent in 1992-93 to 20.4 per cent in 1993-94.

The CSO's estimates of saving and investment are obviously more plausible. When the RBI published its Annual Report about six months ago, it could not have got all the data required for making estimates for 1993-94. A comparison of the two sets of data reveals interesting differences. The RBI had placed the gross saving of the private corporate sector at 3.3 per cent of GDP in each of the years 1992-93 and 1993-94, whereas the CSO suggests that these would jump from 3 per cent in 1992-93 to 4 per cent in 1993-94, which is corroborated by the improved corporate performance indicated by the RBI's own data. Even so, the CSO's estimates show reduced overall gross saving rates because its estimates of both the household sector and public sector saving are lower than those of the RBI. For the household sector, the RBI had estimated a dramatic rise from 16.7 per cent of GDP in 1992-93 to 19.6 per cent in 1993-94, whereas the CSO data not only place the corresponding figures at the more moderate levels of 15.5 per cent and 15.9 per cent, respectively, but also show that they were almost stagnant as between the two years. Amongst the components of household sector saving, that in the form of financial assets (for which the RBI is the primary source and which has shown a remarkable rise from 7.8 per cent to 10.3 per cent as per the CSO and 7.4 per cent to 10.1 per cent as per the RBI) exhibits hardly any discrepancy. It is in household saving in physical assets, for which the CSO is the main source and which is estimated as a residual, that there is a large difference between the RBI and the CSO. The CSO has indicated a slump in household investment from 7.7 per cent of GDP in 1992-93 to 5.6 per cent in 1993-94, probably the cumulative effect of the structural adjustment and stabilisation programmes, including banks' reluctance to finance investment projects in agriculture and in small-scale industry. While household investment in construction remained at Rs 8,982 crore in 1992-93 and Rs 8,321 crore in 1993-94, it is household investment in machinery and equipment that showed a significant decline from Rs 5,264 crore to Rs 1,879 crore. The

difference between the RBI and the CSO has been the widest in the estimate of public sector saving. The RBI had placed the gross saving ratio of the public sector at 2.1 per cent in 1992-93 and 1.3 per cent in 1993-94. Now the details provided by the CSO, based on more recent data, plausibly suggest much lower saving rates of 1.5 per cent in 1992-93 and just 0.2 per cent in 1993-94. This was essentially because dissaving by the government administration had galloped from Rs 13,608 crore in 1992-93 to Rs 29,631 crore in 1993-94, a year in which the central government's revenue deficit had soared from Rs 18,574 crore to Rs 34,058 crore.

Overall, if the CSO is to be believed, the period since the inception of the economic reforms has seen a steady and persistent fall in domestic saving and investment. The rate of domestic saving fell from 23.9 per cent in 1990-91 to 23.1 per cent in 1991-92, 20 per cent in 1992-93 and 20.2 per cent in 1993-94. The investment ratio fell much more sharply, from 27.4 per cent to 24.2 per cent, 22 per cent and then to 20.4 per cent. Indications are that there may be only a marginal improvement in domestic saving in 1994-95. To an extent household financial saving appears to have been eroded by higher commodity prices, particularly those of basic consumption goods. If the rate of investment has to be raised to about 27 to 28 per cent, as it was in 1990-91, the implication of a moderate rise in the saving rate to 22 to 23 per cent is that the current account deficit would have to be of the order of 5 per cent of GDP, which would be clearly unsustainable. The relatively low domestic saving rate is already a serious constraint on stepping up investment. Government policies which have tended to stimulate conspicuous consumption among the rich and middle classes, including by permitting import of gold and silver, have made it certain that domestic saving will remain moderate and that the attempt to push up domestic investment will imply a larger current account deficit and a possible repetition of the structural crisis faced by the economy at the turn of the decade.

CONGRESS

Servile Culture

THAT Sonia Gandhi will eventually restore the balance between the two warring Congress(I) camps by gracing the prime minister's iftar party with her august presence after her attendance at Arjun Singh's earlier was a foregone conclusion. It is also hardly surprising in view of the servile culture of this party that all the bigwigs, otherwise accustomed to throwing their ('heavy') weight about, will display utter humility in kowtowing before the lady. What, however, is nevertheless revolting is the grotesque exhibition of the semi-feudal mores of the band by the provision of the two huge throne-like seats set apart for her and, even more strikingly, for the host, while all the others were assigned to ordinary chairs. Among them was included vice-

president S Narayanan, the second highest dignitary of the state.

This slighting of the vice-president may be an outcome of a mindless conformity with the present-day New Delhi culture or it may as well be a deliberate rebuff to him for his standing apart from this culture in a particularly demonstrative manner. During the felicitation of Nelson Mandela in the central hall of parliament when he came to New Delhi as the chief guest at the Republic Day parade, the highest dignitaries of the state, the president Shankar Dayal Sharma and prime minister P V Narasimha Rao began their formal speeches by addressing among others, Madam Sonia Gandhi by name. Even Nelson Mandela whether on his own or on the hints from the protocol, did follow suit. It was only the vice-president who addressed only the state dignitaries and the honoured guest by name.

By standing apart from the servile crowd Narayanan in the event had underlined the abject self-debasement of our top men before a lady undistinguished in every manner except for the accident of her marriage. As this ceremony was telecast live to the country (and beyond), it was in effect a public humiliation for the distinguished personages. The slighting of the vice-president at the prime minister's party may, therefore, very well be a deliberate enactment. If so, the actors have only further demeaned themselves.

MEXICAN AID PACKAGE

Protection for Creditors

WHETHER or not other developing countries including India, where the authorities are at pains to emphasise how differently they are placed, have any lesson to draw from Mexico's financial crisis, we cannot but take note of the magnitude, manner and speed which characterise the rescue package that has been put together by the US government, the IMF, the Bank of International Settlements (BIS) and perhaps a few central banks. Originally, US president Bill Clinton undertook to provide Mexico loan guarantees to the tune of \$ 40 billion and IMF was to extend assistance of \$ 7.8 billion. Subsequently, taking note of the opposition within the US Congress and also in the public opinion polls, Bill Clinton decided to slash the US loan guarantee commitment to \$ 20 billion and pressurised the IMF to raise its commitment to \$ 17.8 billion and the BIS to fork out \$ 10 billion. And this rearrangement of the sources of financial help to Mexico, without reneging on the extent of the total amount originally promised, was possible to cobble together within days, if not hours. It is interesting to note also in this context that in the G-7 meeting held at Toronto immediately after the announcement of the rearrangement, not only were the initial differences which surfaced at the IMF's board meeting papered over but also the IMF was urged to intensify its surveillance of the economies of the developing countries and monitor them regularly "to avoid a repeat of the Mexico-type financial crisis". The US

treasury secretary, Robert Rubin, is reported to have reaffirmed in this very context that "G-7 is determined to reform the IMF and other international financial institutions" and went on to observe that "our collective priority over the next few months is to ensure that the missions and capabilities of these institutions are as modern as the markets and the world we live in".

While one cannot, and should not, grudge Mexico the external financial assistance it can garner for itself, particularly what it secures through bilateral channels, it does matter to the other countries how multilateral institutions like the IMF and BIS meet requests from different quarters. It cannot go unnoticed that the IMF credit of \$ 17.8 billion to Mexico will be the highest ever extended to a member country in absolute terms; as a multiple of Mexico's quota with the institution, it is without precedent. Furthermore, the IMF's commitment to do away with its usual procedure of making quarterly releases as the agreed stabilisation programme is implemented and release \$ 7.8 billion immediately is without parallel. The commitment of BIS, a club of the central banks of the developed countries, to fork out \$ 10 billion and that too to assist a virtual non-member country - all developing country central banks share this position with Mexico - is in itself an interesting development which lends some credence to the suspicion that the whole Mexican aid package has been put together more to bail out the creditors of Mexico rather than Mexico itself. Indeed, that sort of perception was the principal factor underlying opposition in the US Congress and among the US public to the aid package for Mexico originally laid out by Bill Clinton.

Be that as it may, it is extremely important for the developing member countries of the IMF to be watchful about the sort of so-called improvements that may come to be proposed in the working and operations of the institution and in its capabilities to cope with situations like the one faced by Mexico. It is pertinent to recall in this context that several past attempts at improving the capabilities of the IMF have foundered on the rock of opposition from the developing member countries. Take the question of issue of SDRs. In spite of the fact that international liquidity at the multilateral level has virtually stagnated over the past 20 years or so, all attempts at its augmentations have come to nought because of the stiff opposition of the G-7 countries. These countries preferred international liquidity to be sourced from private, virtually unregulated sources.

Not that the SDR scheme is particularly effective in terms of addition to international liquidity in view of the fact that almost 80 per cent of any SDR allocation gets virtually sterilised into the ledger folios of the IMF in

Because of acute shortage of newsprint, the issues of February 18 and 25 have had to be combined.

—Ed.

favour of the developed member countries. But even a scheme like this had become unacceptable to the developed countries once they realised that their own requirements of balance of payments support were reasonably certain to be met from outside the IMF framework.

When G-7 countries now speak collectively of improving the capabilities of the IMF and other international financial institutions, one has to ask (a) what sort of improvements in capabilities do they have in mind? (b) how would these improved capabilities be operationalised? and (c) can the member countries in need of payments support hope to secure reasonable commitments in line with their objective financial position without necessarily having to canvass political support?

True, developing member countries of the IMF do not anyway carry much weight in the institution's decision-making, given the excessive weightage enjoyed by the developed member countries on the strength of their affluence. But if the developing member countries are not sufficiently watchful and, at the same time, fully united in articulating the sort of multilateral financial support they would like to be assured of, the chances are that the changes which may be effected in the operations of the IMF may be such as may not be truly in their interest. After all, the principal objective of the developed member countries would be to protect their own interests. To a large extent, this is precisely what the Mexican aid package seeks to do.

POLITICS

Protecting the Rulers

A correspondent writes:

THE extension of the Special Protection Group (SPG) Act by an amendment bill passed by the Rajya Sabha recently has serious socio-political and financial implications which the elders in the upper house seem to have ignored by approving of it by voice vote without a discussion.

First, by allowing the continuation of a special paramilitary force for the protection of prime ministers and their families (as provided for by the amended bill) the government is actually re-legitimising through a legal measure an old practice of doling out privileges for certain VIPs and their families. It harks back to the system of privy purses for the former rulers of the princely states which were abolished only in 1970. But, the present set of privileges for the modern rulers of India, as provided for in the SPG (Amendment) Bill, is more burdensome for the Indian tax-payer than the earlier privy purses. The 560-odd princes who were nominal rulers under British tutelage received privy purses totalling Rs 58 million as a quid *pro quo* for integration of their states with the rest of India. This amount gradually came down to Rs 48 million by 1970 because the purses were reduced with each succession.

The SPG Act provides for the supply of specially trained armed bodyguards, not only for anyone who had ever occupied the 'kursi' of the prime minister of India, but also for his or her existing and future progeny – for the next five years at least. This will cost the exchequer Rs 340 million every year, according to union home minister S B Chavan, who introduced the amendment bill in the Rajya Sabha. The new bill was brought in because the five-year period provided for in the earlier SPG Act had ended last year, as a result of which ex-prime ministers and their families would not have been eligible for special protection any longer. But the real reason for this extension of the period is something else. Chavan let the cat out of the bag – unwittingly perhaps, as is his wont – when he told the Rajya Sabha that Sonia Gandhi and her children were still vulnerable to terrorist attacks, and hence the need for the SPG (Amendment) Bill.

Thus, it is once again that old Congress habit of cringing before the Nehru-Indira Gandhi dynasty that dictates the centre's legislative measures. In fact, the entire history of the SPG stinks of sheer selfish motives of the dynasty and its sycophants. When it was enacted during the Rajiv Gandhi regime, its provisions were confined only to the security needs of the prime minister – the fear being that he, like his mother, could be assassinated while holding office. Opposition demands at that time that it should apply also to ex-prime ministers who were still alive and their families were brushed aside by an arrogant ruling Congress dominated by those who are today known as the Rajiv-loyalists in the party.

But, ironically, Rajiv Gandhi was hoisted by his own petard. Once ousted from the office of prime minister, the SPG was withdrawn in accordance with the provisions of the act which he himself had helped to draft. The Rajiv-loyalists in the Congress today are kicking up a shindy complaining about lack of SPG protection for their leader when he was assassinated, completely oblivious of the fact that they themselves had earlier rejected the opposition suggestion for such protection for ex-prime ministers.

A year after the lapse of the provision of five years of the SPG Act, now suddenly a desperate Narasimha Rao has thought it wise to introduce an amendment and pass the bill, presumably to assure Rajiv Gandhi's widow that he is no less concerned about the safety of her and her children than his arch rival Arjun Singh.

But in all this sordid game of the Congress politicians, it is the common people who have to bear the cost. Indira Gandhi created a mess in Punjab and paid for it with her life, leading to a proliferation of security arrangements and paramilitary forces to prevent such killings in the future. Her son made a mess of the Sri Lankan problem, and fell victim to the Tamil militants, as a result of which there was a further escalation in security measures. How long must our people bear the innumerable hazards posed by the security arrangements for these VIPs – ranging from killing of innocent pedestrians by their trigger-happy bodyguards to daily

obstruction of public roads by their security-flanked vehicles?

CHECHNYA

Long Struggle

WITH the talks on ending the conflict between Russia and Chechnya now on, the war has moved into its second, quieter phase. The first phase, marked by intense fighting, has not led to a clear outcome: the Russian forces have captured Grozny, the Chechen capital, but are far from establishing an unassailable ascendancy over the rebels; the rebel militia, on the other hand, has taken a beating in these initial months of the war but has revealed a capacity for struggle, both spiritual and military, which can sustain it for many more months, and may be years, to come.

It is idle to speculate at this stage whether the talks would lead to a just peace in the embattled province and, if so, for how long. There are indications, nevertheless, that they may just be a ruse on the part of the Russian government to gain time not only to redeploy its forces in order to be able to meet the new situation on the ground but also to reassess this situation for political purposes. This in any case is what the reports about the preparations for the installation of an alternative government in Grozny suggest. This government, plans for which have been worked out jointly by the Russian officials and the Chechen opponents of Dzhokhar Dudayev, the president of Chechnya, proposes to rebuild the devastated region and hold elections by the end of the year, as Ruslan Madiyev, the 'foreign minister' in the new government said.

What is not clear is the status of this new – yet to be installed – government, and the status of the republic of Chechnya under this government. Will it continue to regard itself as an independent state as it has so far done after Dudayev had declared it to be so? Or will it just be an autonomous region under the suzerainty of Russia? Statements of the proposed government's leaders only confuse these matters. For instance, Madiyev, the foreign minister, also said that he will seek aid from western and Islamic nations as Russia alone may not be able to bear the cost of rebuilding Chechnya. In what capacity will Russia bear this cost, if at all? The new 'government' has also attempted to play down its connection with Moscow and has condemned in strong terms the Russian air attacks on civilians. On the other hand, as per Zaidi Chaltayov, the new government's 'administration chief', "Chechens are perhaps too proud and independence-minded for their own good". In other words, this government, if it comes to be, will like to tone down this spirit of independence.

It is likely that with this attitude the new government will not accomplish a great deal, if it manages to stay in place. The staying in place would be a real problem, with Dudayev still around and with the majority of the Chechens behind him. No wonder the military advisers of Boris Yeltsin want to see Dudayev dead. Talks or no talks, the Chechen struggle, it seems, will continue for some time.

CURRENT STATISTICS

EPW Research Foundation

Three elements which stand out in the current economic scenario are persistent acceleration of inflation rate, massive expansion of non-food advances of scheduled commercial banks and a sharp fall in equity prices. Equity prices have already lost about one-fourth of their peak attained in September 1994 and the price-earning ratio for the Sensex has fallen from a multiple of about 46 to near 30. The expansion of Rs 29,675 crore (19.4 per cent) in non-food advances so far in this financial year is the highest ever in 15 years. Reserve money has expanded sizeably in the past month as a result of a sudden spurt in RBI credit to the centre. The current fiscal year now appears to be heading for an inflation rate of not less than 12 per cent.

Superscript numeral denotes month to which figure relates, e.g., 1993-94 is for the period specified or over the comparable period of the previous year.

BAYER (INDIA)

New Products

BAYER (INDIA) has done satisfactorily in 1993-94. Net sales were up by 5 per cent (Rs 6.66 crore), operating profit by 15 per cent (Rs 5.96 crore) and net profit by 5 per cent (Rs 59 lakh). Profit before tax fell marginally by 1 per cent. Gross profit was up by 3 per cent. Other income was up by 94 per cent (Rs 3.68 crore), while non-operating profit fell by Rs 4.36 crore. Taxation fell by 9 per cent, while depreciation and interest charges were up by 26 per cent and 4 per cent, respectively. A dividend of 27 per cent was announced for the year as against 25 per cent for the previous year. Exports and imports rose by 63 per cent and 6 per cent, respectively.

Debt-equity ratio of the company has increased steadily from 74 per cent in 1991-92 to 75 per cent in 1992-93 and 87 per cent in 1993-94. Short-term bank borrowings to inventories increased from 34 per cent in 1991-92 to 61 per cent in 1993-94. Sundry creditors to current assets fluctuated at 13 per cent in 1991-92, 19 per cent in 1992-93 and 10 per cent in 1993-94. Raw materials consumed to the value of production declined from 51 per cent in 1991-92 to 45 per cent in 1992-93 and 40 per cent in 1993-94. Return on investment after being steady at 15 per cent during 1991-93 declined to 13 per cent in 1993-94. Earning per share increased from Rs 54 in 1991-92 to Rs 68 in 1992-93 to Rs 71 in 1993-94. Net value added to value of production fluctuated at 22 per cent in 1991-92, 25 per cent in 1992-93 and 23 per cent in 1993-94. Remuneration to employees increased from 37 per cent in 1991-92 to 38 per cent in 1992-93 and 42 per cent in 1993-94.

The major contributors to the growth in sales were agrochemicals, rubber, consumer products and animal health-hygiene and health care products. Herbicide for rice, sugarcane, potato, tomato and soyabean and fungicides for tea and apples were introduced during the year which the company claims to have been accepted by Indian farmers. The recession in the rubber industry continued. Increased exports brought in higher imports of duty free raw materials thus resulting in depressed local demand. The transport strike in September 1993 and the new excise policy proved detrimental to sales of rubber chemicals. The diagnostic division completed its first year of operation and sales of analysers and reagents helped the division in posting profits. The chemicals division, now an amalgam of chemicals, dyes and fibre activities, has done well. The company plans to start its own testing laboratories for dyes and intermediaries.

The company incurred an expenditure of Rs 73 lakh for its R and D activities in the year. The company has successfully developed lacquered aluminium bottles and packaging material. Emulsifiable concentrate formulations were also developed and new

formulations are under test. The company also plans to manufacture products in the categories of insecticides, weedicides and fungicides.

CIPLA

Growth in Sales

Cipla, the third largest pharmaceutical manufacturer in the country after Glaxo and Ranbaxy, commanding a market share of 3.2 per cent, has declared an enhanced dividend of 32 per cent for the year. Net sales improved for 1993-94 by 25 per cent (Rs 46.60 crore), operating profit by 18 per cent (Rs 5.22 crore) and net profit by 41 per cent (Rs 4.26 crore). There has been a marginal rise in taxation, while interest charges rose by 18 per cent and depreciation fell by 7 per cent. Non-operating profit rose by Rs 22 lakh (129 per cent), other income was also up by 3 per cent. Exports were up by 20 per cent while imports rose by 4 per cent.

Debt-equity ratio increased 20 percentage points. Short-term bank borrowings to inventories declined from 47 per cent in 1992-93 to 44 per cent in 1993-94. Sundry creditors to current assets increased from 12 per cent in 1992-93 to 14 per cent in 1993-94. Sales to total assets declined marginally by 3 percentage points. Sales to gross fixed assets declined from 233 per cent in 1992-93 to 218 per cent in 1993-94. Gross saving to gross capital formation rose by 22 percentage points. Return on investment declined marginally. Remuneration to employees declined from 33 per cent in 1992-93 to 30 per cent in 1993-94. Earning per share increased from Rs 333 in 1992-93 to Rs 470 in 1993-94. Net profit to sales increased from 5 per cent in 1992-93 to 6 per cent in 1993-94. Net value added to value of production fell from 17 per cent in 1992-93 to 16 per cent in 1993-94.

Efficient utilisation of resources and improvement in technology helped the company to reduce the prices of some key products. Several new medicines were launched and the company claims them to have been well received. Exports fared well. The company has begun the indigenous manufacture of ondansetron used in treatment of side effects of cancer patients. The

company signed an MOU with Aotoukang Pharmaceuticals of China for a joint venture in China. The 50:50 venture is to be christened Aotoukang Cipla. The company has also set up a plant in Kurkumbh in Maharashtra for the manufacture of bulk drugs, intermediates and formulations of which phase I has been completed. Cipla incurred a capital expenditure of Rs 33.3 crore for its expansion and modernisation programme.

The company incurred an expenditure of Rs 8 crore for its R and D activities. The company developed several new bulk drugs. It has developed a drug for thalassaemic patients, the world's first oral drug for management of the disease. Several drug formulations were added to the company's range of products, particularly in inhalation therapy. The company has the distinction of marketing the widest range of formulations used in asthma treatment which includes metered-dose inhalers, rotahalers, respirator solutions and oral dosage forms.

PREMIER AUTO ELECTRIC

Rise in Profit

Premier Auto Electric, despite an increase in taxation and depreciation by 76 per cent (Rs 55 lakh) and 98 per cent (Rs 66 lakh), has done well with net profit rising by 77 per cent (Rs 1.94 crore), operating profit by 56 per cent (Rs 3.10 crore) and net sales by 23 per cent (Rs 14.02 crore). Other income was up by 154 per cent, while interest payments were down by 8 per cent. A dividend of 30 per cent was declared. Exports were down by 37 per cent.

Sales to total assets declined from 200 per cent in 1991-92 to 195 per cent in 1992-93 and 164 per cent in 1993-94. Sales to gross fixed assets fell in 1992-93 and 1993-94. Debt-equity ratio fluctuated at 30 per cent in 1991-92, 14 per cent in 1992-93 and 24 per cent in 1993-94. Return on investment rose steadily from 10 per cent in 1991-92 to 12 per cent in 1992-93 and 15 per cent in 1993-94. Sundry creditors to current assets has shown a steady increase from 32 per cent in 1991-92 to 33 per cent in 1992-93 and 36 per cent in 1993-94. Short-term bank borrowings to inventories increased by 5 percentage points in 1992-93 and 14

percentage points in 1993-94. Earning per share doubled in the past two years. Net value added to value of production has been constant at 13 per cent for the past two years. Inventories grew by 15 percentage points. Remuneration to employees declined from 38 per cent in 1991-92 to 33 per cent in 1992-93 and 27 per cent in 1993-94. Remuneration to employee as a ratio to the value of production has remained stable at 4 per cent for the past two years. Raw materials consumed to the value of production has been steady at 81 per cent for the past two years. Net profit to sales doubled in 1992-93 from 2 per cent in 1991-92 and has now risen to 6 per cent in 1993-94. Operating profit to gross value added has increased steadily in the past three years.

The total income of the company showed a 27 per cent growth in the year. The performance of the manufacturing plant at Halol improved due to increased demand from its OE customers. The company had in the previous year signed an MOU with Best & Crompton Engg, Madras, to purchase plant and machinery and know-how. The company has also started the production of starters and alternators at its new plant at Madras.

The company invested Rs 8 lakh for its R and D activities for the year. Deployment of indigenous in place of imported material at the factory, fitment of compressed natural gas (CNG) kits in vehicles, for which it has obtained ARAI certification, and expansion in the application of CNG kits to other automobiles are the activities of the department.

KELVINATOR OF INDIA

Out of the Red

Kelvinator of India, one of the largest manufacturers of refrigerators, has done well in 1993-94 after suffering losses in the previous year. The company experienced increase in net sales by 67 per cent, operating profits by 191 per cent and net profits by 294 per cent. Depreciation was up by 2 per cent while interest charges fell by 15 per cent. Non-operating profits fell by Rs 143 lakh (184 lakh) and other income rose by 7 per cent. Exports fell by 39 per cent, while imports were up by 42 per cent. A dividend of 12 per cent was declared for the year.

Debt-equity ratio showed fluctuations at 49 per cent in 1991-92, 23 per cent in 1992-93 and 25 per cent in 1993-94. Remuneration to employees fell by 13 percentage points for the year. Earning per share rose to Rs 9 for the year. Net profit margin showed a rise by 8 percentage points. Short-term bank borrowings to inventories more than doubled, from 38 per cent in 1991-92 to 74 per cent in 1993-94. Sundry creditors to current assets ratio, after being steady around 31-32 per cent during 1991-93, declined to 23 per cent in 1993-94. Return on investment fluctuated at 1 per cent in 1991-92, (-) 1 per cent in 1992-93 and 6 per cent in 1993-94. Gross saving to gross capital formation rose to 260 per cent as against (-) 8 per cent in the previous year. Sales to total assets fluctuated to 90 per cent in 1991-92, 74 per cent in 1992-93 and 106 per cent in 1993-94. Sales

to gross fixed assets fluctuated at 248 per cent in 1991-92, 112 per cent in 1992-93 and 180 per cent in 1993-94. Raw materials consumed to value of production declined steadily in the past three years from 70 per cent in 1991-92 to 59 per cent in 1992-93 and 55 per cent in 1993-94.

The company has tied up with Whirlpool Corporation of the US. The emphasis is to be on improvement in product design, better process engineering and cost reduction. The company failed to revive its automotive division and thus had to close it down.

The company invested Rs 251 lakh on its R and D activities in the year. Development of new models of visi coolers and CFC substitutes in compressors, refrigerators and deep freezers and reduction in cost were significant achievements.

AHMEDNAGAR FORGINGS

Mixed Performance

Ahmednagar Forgings has shown mixed performance in 1993-94. Net profits were up 12 per cent (Rs 33 lakh), while net sales and operating profits fell by 1 per cent (Rs 59 lakh) and 10 per cent (Rs 84 lakh), respectively. Other income rose by 31 per cent, depreciation was up by 26 per cent and taxation and interest charges fell by 40 per cent and 31 per cent, respectively. Imports for the year rose sharply by 592 per cent (Rs 16.6 crore), while exports fell by 20 per cent (Rs 2.14 crore). A dividend of 27 per

cent was announced for the year.

Debt-equity ratio rose from 52 per cent in 1991-92 to 61 per cent in 1992-93 and 83 per cent in 1993-94. Short-term bank borrowings rose from 49 per cent in 1991-92 to 85 per cent in 1993-94. Sundry creditors to current assets fluctuated at 26 per cent in 1991-92, 28 per cent in 1992-93 and 14 per cent in 1993-94. Growth in inventories fell by 7 percentage points. Gross saving to gross capital formation declined by 6 percentage points. Return on investment has shown a continuous decline from 19 per cent in 1991-92 to 13 per cent in 1992-93 and 11 per cent in 1993-94. Earning per share fluctuated at Rs 9 in 1991-92, Rs 8 in 1992-93 and Rs 9 in 1993-94. Net value added to value of production fluctuated at 23 per cent in 1991-92, 21 per cent in 1992-93 and 22 per cent in 1993-94. Remuneration to employees rose by 8 percentage points. Net profit margin fluctuated from 9 per cent in 1991-92 to 5 per cent in 1992-93 to 6 per cent in 1993-94.

During the year the company produced 11,402 mt of steel forgings. Despite recessionary tendencies in the steel industry sales rose by 584 MT. The company received recognition as an Export House from the government of India. Its Ahmednagar factory has been awarded the ISO 9002 accreditation from the Bureau Veritas Quality International (BVQI). The installed capacity at the Chakan plant was enhanced to 10,500 mtpa. Production of cold forgings was also started during the year.

Development Paradigms: China and India Since 1949

Arun Ghosh

The success in putting a burgeoning workforce to productive work constitutes the most important lesson of China's development experience for India and the entire underdeveloped world. No matter what the political framework, the needs of societal development call for this basic change.

CHINA and India may be truly regarded as representing two entirely different paradigms of development. There have been few analytical essays (available to the Indian reader) on the process of development and of social change in China after the victory of the People's Liberation Army in 1949, and the establishment of the People's Republic of China. It is exciting, therefore, to come across a volume¹ that attempts not only an ambitious comparison of Chinese and Indian development during the post-second world war years (until 1990) but also to frame these developments in the context of the history, the cultural and social milieu, the problems and the political background of the cataclysmic changes that have occurred in China over the past 40-odd years, and the slower (and yet doubtless) changes that have been ushered into India under the system of planned development within a capitalist framework and a regulated market system. This paradigm is, of late, rapidly changing in India. So, indeed, is China headed for a change, though one is not quite sure of all the consequences of the latest changes. However, that is another story.

Any book of essays, written by a large number of experts, must be of the nature of somewhat separate and independent essays. The editors have therefore to be congratulated that despite the inherent problem – that of getting each article to focus on the particular in the context of the general – a broad overall picture does finally emerge. Unfortunately, there is no final 'summing up' chapter; perhaps mercifully so, leaving the reader to draw his (or her) own conclusions.

What is the picture that finally emerges in regard to the processes of change ushered into China and India over the past 40-odd years? Let us consider the experience of China first, before attempting to draw appropriate lessons from the Chinese experience for India.

THE CHINA STORY

The China of 1948 was a country with rampant corruption and hyperinflation. During the 19th century, the British had introduced opium eating in China, purely for commercial reasons; and the warlords in China had become

addicted opium eaters. There was little effective resistance to Japanese occupation of the country before the second world war; and the 'older values' had become the privilege of a few mandarins. The awakening brought into the consciousness of the Chinese peasantry by the People's Liberation Army necessarily had to proceed with the hypothesis of 'destruction before construction', destruction of the decadent old order. That the same dogma brought about the sudden collectivisation of agriculture after 1958 needs to be looked at from different viewpoints; and certainly, after the years of the Great Leap Forward, Chinese agriculture again prospered, for the base had been laid through innumerable small works undertaken by the people in a decentralised manner.

The changes in China have been dramatic, and somewhat ruthless. The experience has very obvious lessons for India where – though we have never adopted the type of repressive polity relentlessly pursued in China – we are suddenly switching horses, *the riders being the same*, with single-minded pursuit of personal power and pelf by the 'riders'. The lesson of progress through decentralisation, on which there is little focus in the volume, has never found political support in India. China provides the contrast.

There is little doubt, in retrospect, that the Great Leap Forward in 1958 was a mistake, in fact a big mistake; and in two to three years, caused 20 million deaths from starvation in China. There is also little doubt, in retrospect, that the decade-long Cultural Revolution – which commenced in 1966 and ended with Mao's death in 1976 – proved to be not only a major setback to Chinese development but also caused a lot of suffering and avoidable turbulence in Chinese society. And yet one has only to take a look at the development of both Chinese agriculture and industry since the days of the Revolution in 1949. As per figures given by Wei Jinsheng, the total agricultural product of China, at constant prices, increased from 51 billion RMB in 1953 to 765 billion RMB in 1990, and this growth has been fairly steady except for the disastrous three years of the Great Leap Forward (1958-61) when a severe drought complicated and complemented the sudden and drastic changes in production relations introduced in 1958. In quantity terms, grain production increased from 1.1 billion tons in 1949 to 4.5 million tons in 1990; cotton production from 4.4 million tons to 45 million tons; and vegetable oil production from 26

million tons to 161 million tons. Over the past 40 years, Chinese agricultural production has increased at an annual rate of 3.8 per cent per annum; and if one takes the period between 1977 and 1990, the annual average growth rate has been 6.3 per cent per annum. As far as industrial production is concerned, the share of industry in China's total product increased from 36 per cent in 1953 to 63 per cent in 1990 – in India, the percentage contribution of industry to national output remains at some 24 per cent – while the contribution of agriculture to total product in China declined from 41 per cent to 20 per cent over 1953-90. And though Wei Jinsheng, writing on the industrial development of China, has been critical of the continued emphasis on 'heavy industry' (as contrasted with 'light industries' or consumer goods industries), the industrial growth rate of China has increased from some 15 per cent per annum from 1953 to 1988 to around 18 per cent per annum in more recent years, and probably to an even higher growth rate – leading to inflation – in the past two or three years. (Up to 1988, the figures are those of Don Fureng; the more recent figures are those one gets from other studies and reports.) One must, of course, add that the longer term growth rate of agriculture was achieved despite considerable confusion arising from the 'decollectivisation' of agriculture in 1978. If one sifts through the available evidence, one finds that traditional China's leap into modernity and rapid economic growth arose principally from several factors, as a result of the communist takeover in 1949. After 1953 – when consolidation had been completed by the new regime, and an egalitarian system established – three distinct changes took place. First, all local development was left to local authorities; and with the emancipation of women, the workforce increased phenomenally, with the entire workforce engaged in productive activity. With 1952 as the base year the index of the number of workers (rural labour participants, urban individual workers and state employed workers and staff) increased from 37.2 in 1949 to 114.7 in 1957 (base: 1952=100) and further, to 193.7 in 1978 (Yang Zihui and Zhao Xiaohua, pp 367-68 of the volume under reference). So, the first achievement of the Chinese political system was to ensure full employment of the entire labour force. The percentage of social labour participation was 36.1 per cent of the population in 1952, 40.3 per cent in 1958, 42.9 per cent in 1980, and 49.6 per cent in 1990.

One may question the level of social security in a society where close to 50 per cent of the population constitutes the workforce; but so long as productive employment can be found for such a large percentage of the population, economic development at a rapid rate must be inevitable. Incidentally, this is also a reminder to the votaries of 'efficiency' (at the micro level, and in comparison with international standards) that it is the average productivity of the entire workforce that is the true touchstone of the efficiency of societal organisation. That China has been able to employ its entire workforce, that the economy has been growing rapidly (implying increasing productivity of the entire workforce) is manifest. The Chinese

Society and Development in China and India edited by Kuttan Mahadevan, Chi-hsien Tuan, Jingyuan Yu, M Sumangala and G P Ramachandra; B R Publishing Corporation, Delhi, 1994; pp 423, Rs 450.

authors (in the volume) bemoan the lower physical productivity of the Chinese worker in comparison with, say, the productivity (in micro sense) of workers in developed countries; and there are many hints at the need to introduce a 'market economy' and competitive efficiency. This reflects the Deng Xiaoping thrust of recent years, and ignores the importance of a transition with full employment.

Perhaps one may appropriately put in a word in a different tone at this juncture, with a brief quotation from an arch neoliberal journal, the *Far Eastern Economic Review* (November 17, 1994). In an article titled 'Against the Grain', Lincoln Kaye writes:

But 10 years on losers in Deng's increasingly stratified socialist market economy are pondering how their shattered 'iron rice bowls' can ever be put back together again; they look toward Nanjie for guidance...

Nanjie's recollectivisation began when local party secretary Wang Hongbin, just 36 at the time, repealed the Dengist 'household responsibility' system of farming in 1986. After a six-year experiment with family plots, the village reverted to communal cultivation. Through collective effort, Nanjie now boasts a drought proof 680-metre deep communal well. And, no matter how overloaded the national transport grid, Nanjie's supplies and produce move on the village's own 150-truck fleet. Even the great bogeyman of China's current economic boom, inflation hardly fazes Nanjie, villagers receive their staples in kind rather than in cash.

Agricultural production, which slumped by more than 50 per cent under 'household responsibility', has by now rebounded. It accounted for a record RMB 8 million of village income this year...

If the so-called 'Nanjie model' says anything of interest to contemporary China, according to [a] Chinese Academy of Social Sciences sociologist, "it's all about micro - rather than macroeconomics".

The second major factor in the rapid growth of agricultural production in China arose from 'decentralisation' of production activity from early years of the new regime. The Chinese peasant economy had been stagnant in respect of soil productivity before the communist take-over of the country; and the new system ensured that a large segment of rural labour was engaged in rural construction. Wei Jinsheng has characterised the agricultural development of China as 'tormented' and has divided the period 1949 to 1990 into five sub-periods: (a) 1949-57 when land reform was completed and grain production increased from 113 million tons (in 1949) to 195 million tons (in 1957) and total agricultural production increased by 7 per cent per annum. (b) 1958-62, the period of the Great Leap Forward, after the collectivisation of agriculture in 1956, when rural Agricultural Production Co-operatives (APC) were turned into people's communes. The changed production relations caused a setback and total agricultural production declined by 19.9 per cent in 1962 as compared to 1957 or by 4.5 per cent per year. (c) 1963 and 1965 were two years of readjustment and restoration, when the ownership system was redefined into a three-tier system - the people's commune, the production brigade and the production team, the last one being an independent production unit. Agricultural production increased by 11.1 per cent per year over 1963-65 and by 1965

agricultural production had returned to the 1957 level (which was 37.2 per cent higher than in 1962). (d) 1966-76 were the years of the Cultural Revolution. Though these years have been described as a 'period of tempestuous turmoil and a time of storm and stress', agricultural production in 1976 was still 51 per cent higher than in 1965, averaging a growth rate of 3.8 per cent per year. And finally, (e) the period after 1977 when far-reaching changes in rural relations of production were introduced, with the introduction of the family responsibility system. Between 1977 and 1990, the average growth rate of agricultural production was 6.3 per cent per year.

We make no comment on the report by Lincoln Kaye in the *Far Eastern Economic Review*, in regard to developments in Nanjie, reproduced very partially earlier. We in India do not have access to primary data for China, either at the micro or macro level. Perhaps one can only reiterate the validity of Mao's dictum: 'Let a thousand flowers bloom'.

Wei Jinsheng has brought out the reasons for the growth of Chinese agriculture despite the "tempestuous turmoil... storm and stress" (which he decries). The new regime insisted on "the strategic importance of agriculture, focusing attention on agriculture and developing the rural economy comprehensively". From 113 million tons in 1949, total grain production increased to 446 million tons in 1990 - that is, three times in 41 years. This was possible because of the deployment of a large workforce for rural construction works, mostly small irrigation and other works calculated to improve the moisture retention capacity of the soil, with increased input of soil nutrients (both organic and inorganic). Chinese agriculture did not grow as a result of imported technology (like the Green Revolution in India), but through local enterprise and local effort. By 1989, as many as "83,000 reservoirs had been built with a storage capacity of 461.7 billion cubic metres" of water, and the irrigated farm land had increased to 44.7 million hectares, in addition to 2.3 million hectares of grassland and forest land. There was also an improvement in local technological input, with 1.5 million agricultural experts (college graduates) and 0.85 million of middle level agricultural education.

At the same time, because of the population 'registration' scheme, the relative absence of transport, and focus on 'rural development', and arising from the increased demand from the local population, there has been a rapid growth of rural industries, which introduced deep changes in the rural economic structure. According to Wei Jinsheng, "since late 1970 total product of the rural enterprises has been growing at an annual rate of over 30 per cent". The rural enterprises have employed over one-fifth of the labour force in the villages.

Thus, despite the 'turmoil' and the 'stresses', not only did the yield rates (of all crops, both grain and commercial crops like cotton) improve significantly, there was a phenomenal growth of rural industries. Mao's concept of 'backyard furnaces' helped to foster a more regionally balanced growth than is being ushered into China in very recent years.

The above major changes in the rural production structure were accompanied by two other types of changes: the total product of industry increased from 36 per cent of the social product

in 1953 to 63 per cent in 1990. In this, the share of heavy industry increased from 37 per cent in 1953 to a peak of 57 per cent in 1980 and declined to some 51 per cent by 1990. Both infrastructure and key inputs (like primary energy sources) increased phenomenally.

At the same time, the emancipation of women, and the (somewhat harsh) regimen in regard to control of family size, together with better education and health facilities, freed the women from prolonged periods of child bearing and child care and helped to increase the size of the workforce participating in production. Mass education, and in particular, the education of women, doubtless helped to usher in a new pattern of societal change in China. The commune system - though totally different from the traditions and culture of Chinese society - was doubtless favourable for fostering universal education of children which in turn helped to bring up the skills of the workforce.

Finally, though not explicitly stated anywhere, the egalitarian regimen - doubtless introduced through harsh measures between 1949 and 1953 - was certainly a factor in the continued growth of the Chinese economy, despite the 'turbulence', the confusion, the 'storm' and the 'stress' of the years of the Cultural Revolution. (One must leave out the years of the Great Leap Forward as a bad dream.) Perhaps the focus of the Chinese leadership on decentralised rural development was the crucial element in the continued resurgence of the Chinese economy, despite all the 'turbulence' and the 'stresses' between 1958 and 1988.

The picture is not one of 'unmixed virtue'. The development of education doubtless suffered badly in China as a result of the Cultural Revolution. But the resurgence of higher education after 1976 reflects the success of primary education, where the entrants to higher education originate. Zou Ping and Zhao Xiaohua conclude that the "modern and contemporary history of education in China saw a series of reforms and revolutions with each negative to the preceding one".

There are other problematic issues. Zou Ping and Zhao Xiaohua are critical of the fact that "while natural erosion contributes to 70 per cent of soil erosion in the Loess Plateau due to severe slopes, erosion by human destruction is about 30 per cent". Further, "the coverage of forest on the Loess Plateau (around 4,000 years ago) was over 50 per cent... The present desert of Ke'ermi was once grassland, forest and lakes..." But then, the population of China was only 20 million at that time; and 4,000 years back, much of India was doubtless a densely forested area. Though the authors worry about increasing environmental degradation accompanying agrarian and industrial growth, some 11 billion trees have been planted in the past 10 years with nearly 100 per cent survival rate. Some 40 per cent of China has been covered thus far by the tree planting project, and signals the success of the decentralised responsibility system.

LESSONS FOR INDIA

There are numerous writings available to the Indian reader on the story of India's economic development and on the development of the Indian polity since independence. In the present context, therefore, it may be useful to focus

only on the major similarities and differences between Chinese and Indian economic development, to reflect on the failure of the Indian development effort to 'take off', and the lessons, if any, for India from the Chinese experience.

We must allow for the fact that with two entirely different political systems, one cannot – one should not – compare the Chinese and Indian economies. There are certain costs attaching to totalitarian regimes; and the lessons of the experience of one country can only be partially applicable to the other. Yet, there do remain clear lessons, in regard to both what to emulate and what not to emulate. Let us focus on the former.

Though considerable progress has been achieved by India on diverse fronts – in the matter of self-sufficiency in food production, in building up a reasonable capacity for the production of capital goods and key intermediates – there remain several areas where the Indian situation leaves room for great concern. As per a (rather thin, in terms of sample size) survey conducted by the NSS for the calendar year 1992, 41.7 per cent of the rural population and 37.7 per cent of the urban population (or around 40 per cent of the population in the aggregate) were still below the poverty line; and this datum – in the light of continuously favourable monsoons since 1988 – must be deemed to be a severe indictment of overall economic policies, especially since 1987-88 – a year of drought – shows a smaller percentage of people below the poverty line. One can, of course, rationalise that some degree of inequality is inevitable in the early years of economic growth; the famous inverted U-curve of Simon Kuznets in regard to income distribution in relation to economic growth may be said to be in play. But, and this is a significant point, economic growth in India has been at best tardy, the overall growth rate since the inception of planning – over a period of some 40 years – being at best some three-and-a-half per cent per annum, much of it eroded by a population growth of around 2 per cent. In any case, the increase in poverty – if the 'thin' 1992 NSS is to be believed – after 1987-88 (which was a drought year) would doubtless be most disturbing.

Let us go back in time and briefly examine the Mahalanobis plan model which set out the framework for India's planning effort. The Mahalanobis model – a variant of the Russian model as outlined by Feldman – suffered from two defects. First, it neglected agriculture, which, even as per the 1971 Census, provided the basis of income for some 70 per cent of the population. This is in sharp contrast to the model followed in China where rural development – together with emphasis on heavy industries and infrastructure build-up – was given primacy. Clearly, in a primarily agrarian economy, the first task is the build up of agriculture, of rural employment. This, the Mahalanobis plan, drawing heavily from Russian experience, failed to do. The corrective after 1966 came in the form of the Green Revolution, which doubtless increased the output of foodgrains, but that development was highly unbalanced regionally, with the result that much of the country failed to derive any benefit from the rapid agrarian growth in a few selected pockets. Regional imbalances grew.

The second flaw in the Mahalanobis model arose from within the model. While the output of capital goods increased, the model did not ensure the offtake of the output. The combination of public investment in investment goods and private investment in consumer goods did not ensure the automatic offtake of the output of investment goods; and partly because of (financial) resource constraints with government, the economy suffered by not making full use of the production capability built up. (The South Korean experience, by contrast, was a rapid switch-over of industries started with the objective of import substitution, to export production, with single-minded devotion to excellence in technology, its absorption, and international competitiveness. A certain conjuncture of world polity – when US aid was freely forthcoming for South Korea – also helped that country.) Anyhow, in India, the attempted combination of planning with reliance on the market did not ensure the generation of adequate demand (because of the absence of focus on rural employment) to ensure the offtake of the increased output of producer goods. The planners failed to that extent; yet there was undoubted growth during the planning era, of an order not even dreamed of in two centuries before independence and planning. In China, on the other hand, despite complaints of the preponderance of 'heavy' industries, production growth continues at a rapid pace. Consumer demand in China may well run ahead of supplies, but the process of growth of output has also continued unabated.

There are, of course, certain major differences between Chinese and Indian polity; and policies that have worked in China need not work equally effectively in India. But there have been two other failures in India for which the price has to be paid now. First, though zamindari was abolished soon after independence, proper land reform – in the sense of land belonging to the tiller – has never been properly implemented (Kerala and West Bengal are the only two states where this policy has been adopted even partially). In fact, this is one area where the Japanese, Korean and Taiwanese experience has lessons for us.

There was a second area where the Indian polity did not favour a revolutionary change after independence; the area of women's emancipation, women's education and release of the energies of half the population for socio-economic development. This, in fact, has been one of the major reasons for the Chinese success. The enormous increase in the size of the productive workforce in China contributed in no small measure to China's rapid economic development. Yet the important issue remains: the entire workforce must be found productive employment.

CONCLUDING REMARKS

That perhaps has lessons not only for India but for the entire underdeveloped world. The fact that China was able to put a burgeoning workforce to productive work explains the rapid economic growth of China.

In fact, the same objective facts fly in the face of the dictum of 'market led' development,

which is now the accepted theology almost all the world over. Even without the direct participation of women in overtly productive effort, India has a large population which is underemployed or employed in low productivity jobs. The first requisite is to put this workforce into capital construction, the way Chinese rural labour was deployed. The idea is neither new nor revolutionary. From Ragnar Nurkse and Arthur Lewis in the 50s to the concept of 'food for work' in India in the 70s and 80s, models have been built, and experiments tried out, but the latter have not been pursued with single-minded attention.

This is really a far cry from the concept of market-led development to which even the Planning Commission in India appears suddenly to have been converted. Again, there is nothing new in the concept of putting idle manpower to work for capital construction. And, in the area of capital formation, what we need is a 'widening' of the capital base before attempting to deepen it.

This is the lesson we need to learn from China; and in the context of the widely divergent political systems in the two countries, we can still follow the Chinese model through a process of decentralisation of power and authority, decentralisation of the polity and of the economy, allowing each village community to organise its own 'watershed area' planning to develop agriculture, provide employment, and develop local rural industries.

In the last context, we do not have the same ground conditions as China does. In China, both the 'population registration' system and the absence of a transport network connecting villages to the outside world facilitated rural development in a manner which cannot be replicated in India. And yet the skills of the village craftsmen can still come to their rescue, provided that they do not suffer from terrible discrimination in the matter of credit availability (and the rate of interest on productive loans). This deficiency, as also that of inadequate supply of raw materials, can be resolved through institutional changes. Co-operative credit, the spread of banking in rural areas in the interest of the rural communities (and not for mopping up deposits for lending in metropolitan areas), and similar changes can still transform the Indian production structure, provided that (a) we do not blindly pursue the path of 'market-led development', and (b) we build the institutions necessary for proper 'local area planning'. For this, we need to empower the local communities, and not centralise all power and authority.

This is not to say that all technological changes should be shut out. The growth of technology is essential if we have to provide a better standard of life for a growing population. But the 'management' of technological change in the interest of the people can also be done better through decentralisation of the decision-making structure.

What is essential, in brief, is that we must find some way to productively employ the entire workforce, and seek to increase labour productivity consistent with full employment. No matter what the political framework, the needs of societal development call for this basic change. And with this basic change, other desirable changes are certain to follow.

Election and Bihar's Fractured Polity

A K Roy

The assembly election in Bihar has laid bare the state's fractured polity. Every party is torn, every organisation is fragmented, every leader is suspect.

EVERYTHING in Bihar makes news and provokes views. The present election is no exception. Rather, that the election could start, completing all formalities, is news in itself. At last the parties have selected their candidates. Now the people are to choose from them. The lot is fearsome both in quantity and in quality. The Damocles' Sword of T N Seshan is hanging. As nobody knows what exactly 'Achar Samhita' means, there is nervousness everywhere. What is striking is over-obedience. It shows that the people are fed up with senseless unrest and want some respite. The rule of law has gained a new respectability even though law protects injustice. Status quo is no more regarded as worse than chaos without an alternative. Other factors are also no less noteworthy. The guns are calling for vote boycott. Cameramen are calling for photographs. To make the confusion complete government employees are on strike. There is an air of suspense and uncertainty. Will the election take place at all?

Everybody knows that there is no family planning in Bihar. This is true for the people, leaders and ministers, not to mention the chief minister. Family trees have grown, now yielding fruit. The trend has infected political parties in general. Election year being fertility year, numerous political parties have been born. This is to accommodate the bumper crop of leaders. Aspirations run high. All are equally confident about victory. Only the people are worried. They are finding their defeat on all sides. The most talked about person is T N Seshan. The most discussed party is the party of vote boycotting 'Maoists' (the MCC). The two combined make headlines in the Bihar election.

However, this election has presented one important feature requiring serious pondering. It has laid bare a fractured polity. What was concealed has been revealed. Every party is torn. Every organisation is fragmented. Every leader is heckled. 'Tickets' are acting as the missiles. It appears, the parties became brittle long back and have now crumbled with a mild stroke of 'tickets'. In this election the cause of fear is not from outside but from within. All parties are centres of discord. Dissidents

of one party are blessing the official candidates of other parties scared by their own dissidents. The biggest party in the fray is the party of the dissidents, at least in terms of the number of candidates in the field and so they well deserve a separate election symbol for their 'dissidence'. The ruling Janata Dal has one plus point. It was never a party but a crowd with a sentiment clinging to the hallow of some leader. In Bihar even that wonder got ruptured. The Janata Dal got divided. The Samata Party was born. Being born, the Samata Party is also torn. The only ex-chief minister it had to show in its fold has left. However, those who are not getting tickets from JD are seeking tickets from SP. Still there is no dearth of 'ticket collectors'. Ultimately the crowd has to be dispersed by a lathi-charge from the chief minister's house.

So is gone with the wind all the discipline in the Bharatiya Janata Party. Even the exclusive grace of Lord Ram could not save it from disintegration in south Bihar, the region where it gets seats. Armed with the expertise to demolish the Babri masjid, the ardent devotees of 'Jai Shree Ram' are now out to demolish the party in south Bihar. The quarrel over giving tickets gave birth to a 'Vananchal Mukti Sena' and the Sena immediately after taking birth is out for assault. It started from Bokaro and Dhanbad. It was a devastating spectacle. Offices were stormed. Flags were torn. The holy lotus was trampled upon. Congress(I) has remained always a house divided, but a new chapter has been added recently with the mighty Arjun brought to heel by Rao in Narasimha 'avatar'. If the fall-out in Bihar has been less ugly, it is not because of any newly-acquired restraint, but because of the party's overall bleak prospect in election. Similarly, Jharkhand is also caught in the election cyclone. Going to the Bihar assembly is more important than getting Jharkhand. So before Jharkhand is separated the leaders have got separated over the distribution of election tickets. Now half-a-dozen Jharkhand parties are in the fray along with dozens of rebels. The left, even after maintaining a low profile in Bihar after its bond with JD, is not free from the same symptoms and some odd cases have bewildered the old guards now marginalised in the present political scenario.

When election tickets could divide parties into parts, the fate of the Fronts can well be imagined. All calculations have failed for all the common Fronts. The Bihar election is broadly being fought between pro-Laloo and anti-Laloo fronts. Despite lofty claims of fielding a common candidate in a constituency by the pro-Laloo Front there will be a number of officially acknowledged 'friendly contests' amongst its constituents which are unlikely to remain friendly at the end. Moreover, these will remain thinly veiled rebels against each other. As in the liberalised market economy shares have become free for buying, so in liberalised politics the tickets of many new-comers like the Bihar People's Party have been made available to the rebels. The position of the anti-Laloo Front is even worse. Apart from Congress(I) and BJP upset with their rebels, all efforts at unity amongst Samata, JMM(S), JMM(M), CPI(ML), etc, have floundered on the rocky soil of ever-arching aspirations and claims. All permutations and combinations have failed. Every accord is leading to further discord. The capital of each party is the allegations against others. Nearer the parties, the more fierce are the allegations. Accusations and counter-accusations rent the sky. With all this, the Bihar election is likely to be a free-for-all even with the formidable T N Seshan as the referee.

Thus with all parties in disarray and the leaders scared from within, Bihar is heading for elections. Every party member has become an island and the sole objective in politics is to contest the election. To get elected is to get power. Power gives money. So to get rich quick one must get power quicker. Enhanced pay and perks of Bihar MLAs are an additional attraction. The caste and religious analysis of each party's candidates has come in the media along with similar analysis of the electorates despite the census being silent on that. In all electoral exercises, ideologies and principles have taken a back seat. So the CPI(ML) attempted to make a Front with Samata and JMM(S) though its land struggle was against the former in central Bihar and it was opposed to the Jharkhand Area Autonomous Council (JAAC) sponsored by JMM(S). Election manifestos have become a non-issue, with none taking them seriously. This reminds me of an incident narrated by the lone CPI(M) MP from Orissa. When he along with the late Pramode Das Gupta went to meet Biju Patnaik on election eve, Patnaik said immediately, "Promode da you need not have taken this trouble. We have already acceded Bhubaneswar seat to the CPI(M)." When Das Gupta insisted on some common programme Patnaik hurriedly signed on a white paper and gave that to Das Gupta

stating that whatever he wanted he might type on that and give it to the Press. To the amazed Promode Das Gupta Bijju smiled and said, "after all, neither you nor I will implement them. So what is the use of exercising our mind on that?" Thus the rot started quite some time back.

Though it is hazardous to make predictions about the result of this uncertain election, preliminary indications are that Laloo Prasad will win. He carries some vague popular sentiments, while his adversaries have nothing except venom against him. But this will be the last chance for Laloo Yadav to make structural changes to accommodate the psychological changes he has brought about. Here the left will have a pivotal role in designing that new structure. But the main question is whether the present fragmentation of politics and lack of principles are stray instances or a phenomenon deep-rooted in our body politic. The symptoms point out to the latter. Where does lie the root of this alarming development? The root is in the capitalist way of development, which shorn of all control has taken a belligerent form

under the New Economic Policy where in the name of liberal pragmatism a world without ideals has been declared the ideal world. Whether the cat is black or white, red or yellow what matters now is whether it can catch mice. So in this world ideologies have no place, restraint is foolish, society is nothing, self is everything. Consumerism and acquisitiveness have acquired a new respectability and corruption has become a part of life. Long-term planning has been replaced by short-term gain, creation by hard work by collection by clever manoeuvring. The social fall-out of this policy is the malignant growth of individualism, selfishness and inconsideration embracing all parties, all organisations, society and even the country. This calls for a great social revolution and restoration of lost moral values which would mean in the present context immediate reduction of pay and perks of the elected members at least to half, radical land reform and self-reliant industrialisation on which all parties are silent in their election manifestos except for some vague wailing over the state of affairs in Bihar.

nutrition. Even if it is available in some pastures, the pressure on such land is so high that the per capita availability falls much short of the optimum requirement. Besides scanty rainfall which is the case with Rajasthan, the largest producer of raw wool in the country, there are other factors which need to be considered seriously as a part of the study of the initial conditions.

The most important of all is the steady decline of grazing lands. For instance, at the all-India level it declined from 14,810,000 hectares in 1965-66 to 11,967,000 hectares in 1985-86 and 12,038,000 hectares in 1986-87. Coming to Rajasthan it declined from 1,840,275 hectares in 1985-86 to 1,824,312 in 1986-87. The worry is that the grazing area per livestock which comprises cattle, buffaloes, sheep, goat, horses and ponies, mules, donkeys, camel and pig has gone down in a state like Rajasthan from 0.20 hectares in 1972 to 0.16 hectares in 1983. It appears to have declined further in 1988. The government of Rajasthan's Draft VIII Five-Year Plan noted with grave concern that "the proportion of land under permanent pastures and other grazing lands is not only low, but also has remained broadly unchanged and with the increase in the livestock population particularly sheep and goat, the available village pastures and grazing lands have come under severe pressure". The study conducted by IIM, Ahmedabad, reveals that the area under permanent pasture and other grazing land in Gujarat is steadily reducing with a declining growth rate of 0.5 per cent. In view of the decline of the grazing land on the one hand and increasing competition due to increasing livestock population on the other, one can well imagine how much would be the per capita availability of land for sheep for grazing. One of the major reasons is that more and more lands are coming under cultivation with the help of new sources of irrigation. This is further aggravated by the uninterrupted illegal encroachment of grazing land by influential people in the rural areas for cultivation leading to further shrinkage of the common pasture land.

Added to it, an emerging phenomenon is that young men and women are gradually switching their occupation from sheeprearing to others like agriculture owing to low returns in sheep husbandry. The reason for such low return in Rajasthan is the large-scale appropriation of value added of raw wool by the middlemen and commission agents who finally pass on a very small share to the raw wool producers. Over and above this, large import of raw wool from New Zealand in the recent past, which has been made possible by drastically reducing the import duty, has reduced the price of local wool. Even devaluation of Indian currency does not appear to have helped in raising prices. All these factors are likely to

Hand-Knotted Carpet Industry Myths of 'Export Drive'

Sunil Ray

The myth of the international competitiveness of the Indian hand-knotted carpet industry rests on an arrangement where raw material cost is depressed through an imperfect market which prevents the raw wool producer from recovering his cost of labour and where the social cost of depreciating grazing lands is not reflected in the cost structure. Finally, there is the well documented abuse of child labour by the industry.

THE New Economic Policy of the government of India has identified the woollen textile industry as one of the export thrust industries. To enhance the level of export of carpets (hand-knotted carpets) and achieve better competitive edge in the international market the Indian Woollen Mills Federation, Bombay, has estimated that 62 million kgs of raw wool of good quality would be required by the end of the century out of which 42 million kgs have to come from the indigenous sources as against the present level of 16 million kgs of wool which is suitable for carpet manufacturing. The balance estimated to be 20 million kgs is to be met from import. The export drive *per se* in the face of BOP crisis may not be a matter to be disputed in the short run. The matter of great concern, however, is how feasible the 'so-called' drive is and at what long-run social cost the drive is undertaken.

The export potential and, therefore, the export 'drive' need to be viewed against the initial conditions of production of raw wool carpet and the long-term social cost to be borne by the economy. The initial conditions of raw wool production are the availability of grazing land and increasing scale of reproduction of sheep and for carpet the initial condition is the availability of huge mass of child labour. In order to optimise the wool production of sheep, 10 per cent protein level in the daily ration (Report of National Commission in Agriculture, Part VII, Animal Husbandry, New Delhi, Ministry of Agriculture and Irrigation) is required. The problem which is increasingly intensifying is that the pasture and grazing lands which used to provide optimum nutrition level by virtue of having mixed type of harbage containing both leguminous and non-leguminous forages and grasses can no longer provide such optimum level of

reinforce each other and as a sequel supply response of raw wool production might fail to be commensurate with the expected rise in export-led demand for raw wool by the turn of the century. The immediate remedy one could foresee is increase of import of raw wool, which will have its decelerating effect on the price of local wool further. One may not then wonder if the increasing industrial capacity especially for yarn manufacturing is maintained largely by import in the absence of the supply response of the local raw wool producing sector.

UNACCOUNTED COSTS

According to the neo-classical theory of trade a country that has relatively a large supply of one factor is said to be abundant in that factor, and the relative cost of production of the good which uses the abundant factor more intensively, other things being same, will be lower in that country. If scarcity margin of natural resources like grass and grazing land is estimated even at shadow prices and incorporated in the cost calculation, then the cost efficiency will be higher in the endowment structure, so much so competitiveness of the carpet industry in the international market will fall drastically. The grazing land which is subject to constant depreciation is still considered to be abundant because no mechanism exists to account for the scarcity margin. Yes, abundant labour, including children and old aged people, is available and, therefore, the supply of labour to maintain the sheep flock and produce wool is assumed to be infinitely elastic. Resultant subsistence wages are so low that raw wool production has turned out to be incidental, thanks to the meat market which has at least allowed the sheep rearing activity to continue still. The millions of sheep rearers have, of course, no reason to expect to receive more than what they receive now from the existing 'oligopolistic-monopsonistic' wool markets. While surveying the rural areas of Jodhpur, Jaisalmer, Bikaner and other parts of Rajasthan and the wool markets a huge difference is found to exist between the prices received by the wool producers and the price at which it is sold to the final users.

This brief illustration explains the inner dynamic of 'real market' which is riddled with informal contracts through personalised interchanges and embedded with various exchange relationships. Conventions, contractual interlinkages and asymmetry of information are the rules that dictates the process of price formation of local wool. This continues to happen in spite of government intervention whereby changes are sought in the structure of exchange. In an imperfect commodity market like wool market of Rajasthan, allocative efficiency

and utility maximising standard fall short and the cost of labour is never allowed to reflect in the actual price of the produce, let alone the social cost of ever depreciating grassland. Notwithstanding such expropriation, 'distress sale' of raw wool continues and will continue so long as the opportunity cost of sheep husbandry as an occupation which fetches money to the rearers by way of selling sheep, wool and manure is higher than that of the other occupations in the rural areas. Such 'distress sale' of raw wool is one of the factors responsible for keeping the cost of production of carpet low. This does not mean that the price paid by the final user, the yarn manufacturer for raw wool is low. It is certainly, as mentioned above, higher which is why the middlemen and commission agents are able to make considerable profit out of wool trade. But the point is that if the cost of labour and other inputs is reflected in the price at which the raw wool producers sell their wool, the cost of production of carpet would then be much higher given the same share of the middleman and the commission agents in the final value added. Hence, the cost of production is lower not because of infinite elasticity of labour supply for raw wool production but mainly because of imperfection in the commodity market for wool. Now suppose that supply of labour in raw wool production is elastic owing to the relative increase of opportunity costs of other occupations, viz, agriculture. It means that less number of people would be prepared to work in sheep rearing activity. It would lead to reduced wool production which should eventually entail scarcity margin to the producers. However, as mentioned above, market imperfection will not allow such margin to percolate down to the actual producers. Even if it happens, the extent of it would necessarily be marginal given the degree of imperfection. More so, scarcity margin cannot be assumed to be too high to raise the price of local wool because such scarcity can easily be removed and is removed at present by the import of raw wool. In addition to it, if pricing of grazing of the depleting grazing land is introduced and the raw wool producers are asked to pay the users' charges, then it would reduce the opportunity cost of raw wool production because market imperfection in the wool market may not allow the raw wool producers to recover such charges. If it is recovered by them then one can well imagine how much relative cost of production of carpet would be. Hence, in a situation where raw material cost is kept low through an imperfect market which does not allow the cost of labour of the raw wool producer and the social cost of depreciating grazing land to be reflected in the cost structure, how does one claim cost efficiency in the international market?

CHILD LABOUR AND COMPETITIVENESS

The last important aspect which is known and well documented is the use of child labour in the carpet industry. How genuine is the competitive advantage of the industry gained by subjecting children to inhuman labour processes is anybody's guess. Thanks to poverty, there is infinite elastic supply of labour of children and, therefore, 'distress

sale' of labour power. This is not the issue here. The issue is how does one see the export potential of hand-knotted carpet industry of India when a strong movement against the buying of carpet produced by making use of child labour is gaining currency world over especially in the major carpet importing countries from India? Of course, there is little to be bewildered about the frequent pronouncements of the state on the legislation on enforcement of child labour regulation act. For several such pronouncements were made in the past but to no effect. It all depends on whether the government is interested in resolving the conflict between its understanding of the problem of child labour and its objective of earning foreign exchange. The state, of course, claims that child labour is a 'harsh reality' produced by poverty which forces many families to send their children to work to ensure survival. It appears to be a correct understanding on the part of the state. However, correct understanding is one thing but remedying the 'harsh reality' is another thing, because a clash with the objective of foreign exchange earning in the present context is absolutely certain. What position is the state then going to take - earn foreign exchange through export drive or remedy 'harsh reality'?

Child labour is indispensable for the industry to survive in the international market. It is a living human technology with the well defined requirements of the tender fingers of the child labour with easy flexibility. Adults' fingers and machines are no substitute for children's fingers in manufacturing carpets and achieving competitive edge in the international market. Hence, if the export drive is to succeed child labour is bound to be there in the carpet industry not only because it is available at cheap rates, but chiefly because it cannot be dispensed with.

Both the huge mass of raw wool producers in the countryside and the children in the carpet industry are engaged in bringing foreign exchange to the economy which in exchange pays them to meet the cost of survival. The 'distress sale' of labour power of both these productive forces may continue to feed the carpet industry so long as their survival is at stake. But what cannot feed the industry any longer at no cost is the depleting natural resources, i.e., grass and grazing land.

It is acknowledged even by the 'free marketers' that unless the initial conditions of production change, globalisation has no effect on economic development. On the basis of this assertion if a move is made to change the initial conditions by way of (1) incorporating scarcity value of grazing land in the cost calculation, (2) removing imperfection in the commodity market of wool, and (3) replacing child labour (or

paying higher wages to child labour) on no consideration hand-knotted carpet industry can be identified as an export thrust industry.

The relevant issue then is not the short run calculus of gain accruing to the economy through export, much more important than this is the long run economic development *vis-a-vis* social cost the economy is going to bear. While concentrating our attention on export earning through carpet manufacturing we have forgotten the fact that the varieties of local wool produced in our

country can also have other consumer uses. If an attempt is made to explore the other uses then the large domestic market which is yet to be tapped can trigger off localised process of development in the absence of which no amount of foreign exchange can bring about economic development. Even if we assume that long run social cost can be addressed by restructuring the production conditions that could lend credence to the export drive at least in the short run, the question remains to be answered whether the state can afford to do so.

Subaltern Identities and Struggles

Agenda for Transformation

Mahesh Gavaskar

The second Vicharvedh convention at Latur focused on the transition the subaltern struggles have gone through and the issues that continue to riddle them. The convention agreed on a multi-pronged approach to social reality so as to avoid compartmentalisation of progressive energies.

TWENTIETH century has witnessed tumultuous change in all spheres of life. Awesome technological strides under the aegis of capitalism have helped market forces to penetrate the remotest corner of the globe. Industry and agriculture, space and culture have been increasingly colonised for capital accumulation. But the colossal booty garnered has not reached everyone in equitable amount. Instead, the profit-seeking drive has endangered the life chances of many, rendering them peripheral in its historic march towards superabundance. These victims of progress have time and again thrown up incisive critiques of existing development paradigms and have appropriated histories to mobilise their respective identities as sites of resistance. The second 'Vicharvedh' convention at Latur focused on these subaltern identities, the transition their struggles have gone through and the issues that continue to riddle them. Raosaheb Kasbe, a noted dalit thinker, presided over the convention while Narayan surve, the president of the Marathi Sahitya Sammelan at Parbhani, was the chief guest. The convention, organised out of the contributions of the toiling masses of the Comrade Krantisimha Nana Patil Trust, unanimously appealed for a multi-pronged approach towards social reality so as to avoid compartmentalisation of transformatory energies.

FLEXIBLE ACCUMULATION AND WORKING CLASS

Rajiv Sane, a trade-unionist from the industrial belt of Satara, recounted the momentous shifts that are taking place in the production processes, both at the level of industrial organisation and at the level of labour market structure. The old Fordist model of mass production is being replaced by small compact firms producing goods in batches. The economies of scale which entailed execution of all industrial operations under a huge single canopy is being displaced by the economies of scope which involve restricting essential operations within the premises of a firm and subcontracting other services and outsourcing certain specialised ones. This structural change, Sane opined, affects labour recruitment in two ways. Firstly, the statutory relationship between the owner and his workers transforms into

a transitory one resembling that between the consumer and the vendor. The workers congregate in small guild-like surroundings, selling their product on contract to the owner who further processes it. Sane referred to this process as peasantisation of the industrial workforce. Secondly, due to the reduction in permanent workforce, the labour branches into two categories – the displaced, constituting the majority, and the assimilated, forming the minority. The latter has all the privileges and becomes status quoist, neglecting its responsibility in larger transformative endeavours while the former, yearning for betterment, lacks clout because of its dispersed livelihood. Sane visualised the interests of the displaced and the assimilated workers as heading towards collision. The exit policy which allows retrenchment without prior approval of the government is a constant threat to the assimilated worker, while depriving the unorganised labour of protective measures furthers the insecurity of the displaced worker. The displaced labourers toil more and make available their wares at a cheap rate so as to sustain themselves in the market. On the other hand, the assimilated workers, decreasing in size, eventually become redundant. Their earlier strategies of go-slow or strike are no more effective bargaining encounters since most of the execution now takes place beyond the so-called industrial premises. These changed contours by undermining the objective basis of class struggle have far-reaching consequences for the working class movement. According to Sane, with increasing stratification and interpenetration that is occurring within the working class, the most touted slogan of working class solidarity is becoming obsolete. On the trade union front, the public sector, the main base of party-based labour unions, is rapidly diminishing. In the private sector owner-sponsored or professional trade unions are gaining ground with party-based unions facing extinction.

After this sociological enunciation, Sane put forward his reformist programme. He demanded withdrawal of opposition to global capitalism and instead sought taking advantage of the spaces provided within the new system to mitigate exploitation. He advised trade union leaders not to confuse disputes between capitalists, such as swadeshi

versus TNCs or public sector versus private sector, as their own. What was essential at this juncture was to consider the working class situation not within the nationalist framework based on geographical lines of division but from the labour point of view. In this context Sane found the managerial techniques of the west progressive and far more humane compared to their Indian counterparts. His three-point programme listed democratisation within the factory system, rational utilisation of labour and democratisation of labour unions as priority issues.

Though Sane presented an objective picture of the contemporary transformation of the production sector and its implications for the industrial working class, he made no attempt to forge a new, non-industrial identity of the toiling masses given the changed modes of labour control and surplus extraction. In spite of announcing the redundancy of the industrial workforce as the revolutionary vanguard, it is the very same industrial (and assimilated) labour that underpins Sane's reformist programme. Sane definitely does not claim an end of exploitation with the advent of TNCs but at the same time fails to derive logical conclusions from the shift in the terrain of exploitation that accompanies the entry of TNCs. No more can an emancipatory action plan be enunciated in pure class terms. Caste, gender and other ethnic categories of the oppressed need to become part and parcel of any theoretical formulation regarding the new international division of labour. Bhalchandra Congo, a CPI trade unionist of Aurangabad, articulated this position when he called for a radical restructuring of the theoretical base and organisational efforts of the subalterns, linking the agitations of blue-collar workers with that of dalits, women and the unorganised sector.

ENLIGHTENMENT AND ECOFEMINISM

More insights into the trajectory of capitalist growth were provided by the ecofeminist perspective as expounded by Chhaya Datar in the session on women's movement. Datar recapitulated the liberal feminist, Marxist feminist and radical feminist positions on gender-based division of labour. Both, liberal and Marxist feminisms, saw technological progress liberating women from the prison-house of domestic drudgery. Both conceived equal status of women in the public sphere as the hallmark of an egalitarian society. Though both schools deny biological basis of gender discrimination, Marxist feminism posits woman's domestic confinement as an outcome of the necessity to continue male ownership of private property. Once private property is abolished, as in communism, woman will no more be chained to her reproductive role. Radical feminism advances the concept of patriarchy as an autonomous

mode of oppression, separate from capitalist exploitation. Radical feminism highlights gender difference and espouses a distinct manifestation of feminist sensibility and expression throughout history. Ecofeminism develops upon this experiential faculty of women and organically situates their predicament within the contemporary phenomenon of ecological destruction. Unlike liberal feminist concern for equal access to opportunities, Marxist feminist criticism of capitalist ownership of production and radical feminist stress on cultural identity and signification system, ecofeminism problematises the epistemo-logical basis of capitalist patriarchy. Ecofeminism locates the centralised, hierarchical and exploitative capitalist growth in the dividing practices legitimised by enlightenment. By defining progress as successive liberation from the realm of necessity/nature and placing women and colonies as variations of nature, the enlightenment project since its very inception was not only anthropocentric but also ethnocentric and androcentric. Progress, in short, was the white male's triumph over nature. Envisioning woman as part of nature obviously reified her work and reproductivity. Marx's free proletariat was parasitical on housewife's unfree labour. The ecofeminist vision unveiled that industrialisation, an epitome of enlightenment achievement, was based on similar generation of internal colonies across the globe. It questioned the equation of development with technological advancement and clearly stated the impossibility of restoration of regional balance in the given framework of development.

Datar opined that the left parties in India concurred with the Nehruvian model of industrial development and hence were unable to provide a long-lasting solution to unemployment and poverty. She feared that under GATT rural India would witness and enclosure movement similar to that which occurred in 18th century Britain. Shortages of fodder and drinking water would grow and women would bear the brunt of the burden. Datar's ecofeminist blue-print advocated: (i) Equitable distribution of water, not on the basis of size of landownership but on the size of the family. This would empower even the landless families in asserting their right to water. (ii) Women exerting right over the permanent assets developed in the vicinity of the villages under EGS. And (iii) acknowledgment of the right of the village over the wasteland surrounding it.

Though the ecofeminist critique of enlightenment value-system has points of moral strength and has some grass roots level micro experiments to validate its stand, there are certain doubts regarding how effective the critique will be in dismantling the hegemony of global capital. The critique, instead of politicising the space which at present is certainly captured by global capital, retreats into politicisation of place which

carries no possibility of getting replicated at macro level. In fact, Datar recommended that the first step towards circumventing the widening gap between the first and the third world be to terminate international trade. This naive position overlooks the extent to which the global is getting enmeshed in the local and determining the emerging contours of the latter. Moreover, reading the sharp polarisation predicated between the global and the local in the ecofeminist texts one gets an uneasy feeling that the ecofeminists are falling into the trap of dividing practices which they themselves condemn as a legacy of enlightenment. Many critics of capitalism have hinged their alternative projects on the hope of an imminent crisis within capitalism. Ecofeminism plays upon this theme of downhill trend of capitalism and expunges the possibilities of counter-checks and counter-balances engendered within the present phase of global capitalism. A Balirajad, however path-breaking in the developmental field, cannot negate the geo-political dominance of IMF and World Bank and the need to counter them on their own terrain.

Other discussants hardly addressed the issues raised in the presentation and proceeded to voice their own judgments on the women's movement. While Nisha Shivurkar of the Socialist Front called for stepping up the anti-liquor campaign to pressurise the government on the issue of prohibition, Rajendra Vora, a political scientist from Pune university, expressed his disagreement with Chhaya Datar's lamentation that there has been a paucity of theoretical engagement in the women's movement. According to Vora, there has been a spate of women study centres in the academia which has never been the situation with any other movement of the subalterns. He argued that by getting entrapped in setting up legal consultation centres, the women's movement has lost a sense of broader socio-political change and hence incidences like Jalgaon sexual blackmailing occur. Ram Bapat tried to counter-balance this lopsided evaluation of women's movement by commenting that setbacks are being experienced on all fronts and hence it would be injudicious to make any one movement a scapegoat for social ills.

REDEFINING 'THE POLITICAL'

V D Phadke narrated the manner in which satyashodhak principles of Phule's movement got diluted by his self-proclaimed followers in the latter phase of the non-brahmin movement. Phule was for simple and inexpensive marriages without a brahmin priest. The non-brahmins though they may have emulated Phule on the latter point, nevertheless indulged in ostentatious marriage functions. Phule was a staunch supporter of prohibition but four out of the 19 non-brahmin leaders elected to the legislative council in 1923 were owners of liquor-dens. *Kaivari*, a periodical run by

Bhaskarrao Jadhav and edited by Dinkarrao Javalkar, used to carry liquor advertisements on its very first page. A vehement opponent of brahminism, Phule equally distanced himself from tall claims of kshatriyahood. Satyashodhak leadership was characterised by noteworthy absence of aristocratic marathas, kayasthas, lingayats and jains. These very social groups monopolised the leadership of the non-brahmin movement and kindled a pride in the kshatriya status. Many a family started excavating (inventing) their links with the royal lineages of the north. Genealogies started to be fabricated. Kadams claimed to be heir to Kadamba dynasty; Mores forged their links with Mauryas while Bhonsales sought prestige through rajput Sisodiyas. Phule conceived the shudras and the at-shudras as the social revolutionary force. But the non-brahmin's definition of bahunjan entailed deletion of brahmins on one hand and that of the dalits on the other. Phule's diatribe was against both, shetjis and bhatjis (marwari moneylenders and brahmin priests), but the non-brahmin leaders overlooked the former since most of them, especially the Chettiars and the Mudaliyars of Madras province, were engaged in trade and credit. Lastly, Phule's stress on universalisation of primary education too, was neglected in the non-brahmin period even when Bhaskarrao Jadhav, a non-brahmin leader belonging to respectable maratha family, was an education minister in the governor's council. In short, satyashodhak's total boycott of religious, economic and political middlemen got occluded in the non-brahmin phase to an anti-clerical stance.

Commenting on contemporary socio-political situation in Maharashtra Phadke made two observations. He remarked that the recent attempts to project Phule-Shahu-Ambedkar as nationalists was a move to strengthen the image of the Congress as the sole inheritor of the nationalist struggle. He cautioned that the leaders involved in caste politics should keep in mind that organising people on caste lines should be seen as an inevitable but not a commendable step. Otherwise, the sad part of present-day reality is that those very leaders who are foremost in the struggle to annihilate caste turn out to be most conceited when matters come to their caste identities.

The overall thrust of Phadke's presentation was that the original inspirations which guided the satyashodhak movement during Phule's and Shahu's time suffered an eclipse in the 1920s. The main reason for this debacle was the germination of political ambitions among the non-brahmins with the declaration of the Montford package in 1919. On these grounds Phadke classifies the satyashodhak movement as a socio-cultural one and the non-brahmin movement as a political one. The limitation of this theoretical paradigm is that it postulates the political only with reference to the British. An overt pro- or anti-British stand qualifies

it as a political act. Phadke reads the preamble of the Satyashodhak Samaj instructing the followers to desist from anti-British activity as the samaj's non-committal stand on political matters. This circumscribing of the political to British colonial power blinds one from grasping the hidden political meaning of Phule's overtly socio-cultural activities. In this context, the numerous journalistic ventures and pamphleteering of the non-brahmins in the 1920s should not be documented as merely cultural happenings but as events of politicisation of culture. Further, if the non-brahmin movement is imagined beyond the Jadhav-Jedhe-Javalkar trio then perhaps one might notice satyashodhak inspirations still enriching various avenues of non-brahmin social life. Hari Narke, a scholar of satyashodhak movement, substantiated this view when he disclosed the satyashodhak links of various personalities prominent in the field of labour movement, journalism and co-operatives. Keshavrao Vichare, a satyashodhak, was a pioneer in the co-operative movement of Satara. Also significant is Savitribai Rode, a ramoshi and a chairperson of Pune satyashodhak samaj. She ran a periodical entitled, *Ramoshi Samachar*, in 1927.

CLASS DECENTRED

Since independence the nation-state and the market have been the two major forces netting the widely scattered Indian populace into the process of democratisation. Democratisation has taught various sections of the populace the language of rights so as to alleviate their deprivations. But democratisation has also acquainted them with their specific histories of oppression and as a consequence has introduced diverse voices in their articulation of rights. In such circumstances, social movements need to give up their dogmatic insistence for a singular site around which all oppositions can be framed. Gopal Guru made an half-baked attempt to enter into a critical dialogue with certain positions in vogue on this issue. Guru, at the very outset, rejected the liberal interpretation of Ambedkar's view of political power. The liberal version, embraced by many renowned sociologists, believes that a relative deprivation stemming from unfulfilment of dalit aspirations for status upgradation results in the agitations of the downtrodden. Guru lists three reasons which counter this proposition. Firstly, the buddhist conversion has provided an alternative frame of reference of determining status. Secondly, the democratic claims of Hindutva allow dalits a feeling of fraternity, however spurious. Lastly, existence of the welfare state acted as a beacon, instilling hope among the downtrodden to overcome their social deprivations. However, when Guru attempts to problematise the relation-ship between dalit liberation and post-modernism, he does grave injustice to Foucault by pushing him

into the post-modernist camp. Foucault is a post-structuralist certain of whose positions are being appropriated by the post-modernists to canonise him as one of their pantheon. Foucault's conception of micro-processes of power need to be understood in the context of his anti-utopian vision. When Foucault speaks of multiple sources of power he dismisses the conventional approach of attributing an eminent position to the centre as the source of power, and instead seeks to relativise power by contextualising its operations. If, as Guru points out, caste Hindus unite against dalits on the question of pasture land then in case of mahar-mang conflict certain sections within dalits become oppressors of their own brethren. Thus, power is dispersed, omnipresent and immanent in a Foucauldian sense. Moreover, Foucault while speaking of dispersal of power does not obliterate the terrain of resistance. In fact he visualises resistance as an inseparable component of any power relation.

Similar slipshod treatment was evident in Guru's appraisal of post-Marxism. Citing the example of disagreement among backwards on the issue of renaming of Pune university, Guru concluded that post-Marxism, which prioritises caste, gender, race as sites of confrontation, fails to provide a satisfactory answer to above-mentioned phenomenon. Here it is important to note that post-Marxism emerged as a reaction to the tendencies of class reductionism and essentialism dominant within Marxian discourse. It evolved out of a theoretical engagement with anti-nuclear, anti-apartheid, feminist, and youth move-ments that were spawned in the post-world war west. Post-Marxism is based on the real-isation of multiple identities of human existence and their politicisation according to conjunctural possibilities. It is in this sense that it does not accord a privileged position to class as the sole articulator of antagonisms. In fact the fragmentation of social reality with the advance of global capitalism has multiplied sites of friction and legitimacy of a monolithic meta-narrative has evaporated.

Nonetheless, Guru drew attention to a crucial question regarding the relationship between identity and representation in an emancipatory discourse. Guru observed that there has been a recent misconceived tendency among the dalit intellectuals to arrogate authenticity for their positions on the sole basis of their belonging to the oppressed community by birth. Guru rightly questioned the soundness of such arguments as they derail the broader process of democratisation by setting up opaque walls of non-negotiation around them. Uttam Kamble, editor of *Sakal*, pointed out that more than a thousand sessions of various caste associations take place all over Maharashtra every year. This 'awakening' has a particular caste figure at the centre of inspiration. These various icons are then played against each other to the benefit of the power-wielding sections in the

society. Thus, if class is decentred and plurality of suppressed voices is to be given adequate space, it should be seen that this emerging diversity is not ghettoised into small enclaves and deprived of an access to a more authentic universal narrative.

BUILDING NEW BRIDGES

The destruction of Babri masjid has badly shaken the faith of Indian Muslims in the Indian state. In laying the foundations of a secular nation, the makers of the Indian Constitution had deposited their trust in the impartial functioning of the state machinery as a counter-force to societal tyranny in form of communalism and casteism. But the riots over the past couple of decades have exposed the biased functioning of the state apparatus. Faced with the spectre of insecurity, Muslim intellectuals have become vigorously vocal in their harsh appraisal of post-independence minority politics and have started to chalk out fresh ways and means of defining their predicament. One such attempt was the presentation made by Fakruddin Bennur, a founder of Muslim OBC Front in Maharashtra. He spelled out the dangers of constructing politics on the basis of religious minority identity. Religious minoritism, or for that matter any minoritism, according to Bennur, is based on an implied criterion of separatism. In the age of the welfare state, mobilisation on grounds of minoritism may have pragmatic justification for securing concessions. But it also indirectly circulated a false impression of a monolithic, distinct community which in days of communal frenzy contributed to its easy victimisation. Bereft of any defences from within, the policy of minoritism leaves no option but to seek redress through internationalisation of its grievances. Hence, instead of confirming to a top-down view of Muslim elites, Bennur advocated a view from below that bares the chasm between elite Muslim and plebeian Muslim, a chasm wider than that between the latter and the OBC Hindu. Situating the Indian Muslims firmly in the Indian social milieu reveals the prevalence of caste system amongst them. Bennur wants a caste struggle to be initiated among the Muslims similar to that of the OBC Hindus. The ashrafian view of Muslim religion is a brahminical view and has in a distorted fashion projected to the outside world that 'talak' is the prime problem amongst the Muslims. Interestingly, the findings of a survey of seven states, as mentioned by Razia Patel, also conveyed that Muslim women list poor education, insecurity and unemployment as more worrying than talak or polygamy. At the present juncture, Bennur's viewpoint carries a polemical weightage given the caste-class overlap among the Muslims. Nevertheless, Bennur nowhere seemed to deny the Muslim dependency on the state, but rather demanded a redrawing of Muslim social base for appropriation of state resources.

Politics of Silhouetted Anger

Gautam Navlakha

The government has played a prominent role in perpetuating and promoting communal prejudices and differences through its policies and pronouncements on Babri masjid, Kashmir, Pakistan and other issues. An enemy image has been deliberately promoted by blurring the distinctions among Pakistan, the ISI, Muslim fundamentalists and Indian Muslims creating an active sense of insecurity among Muslims and suspicion in the minds of the rest.

ROSALYN CARTER once observed that Ronald Reagan made the American middle class feel comfortable with their prejudices. She was pointing to the re-emergence of racial preconceptions, considered unacceptable during the 1960s and 1970s and to the fact that in its virulent comeback the policies and pronouncements of the Reagan administration played a prominent part.

Considering the overwhelming importance of government in our lives, and the manifold ways in which it influences and governs us, its capacity to mould opinions or sensibilities is immense. It does not follow that people are pliable and can be manipulated endlessly, nor that human beings are inescapably bound by identity. But government can lend social acceptability to prejudices, promoting or playing upon them, to protect its interests. This power acts in two ways. First, by selection, suppression or projection it can make an issue appear different than it is, thereby creating a frame of reference and setting the agenda. For instance, class exploitation may be obfuscated under the more commonly understood terminology of caste and community oppression. This becomes possible because common interests, values, rituals and memories become media for such articulation. More important, however, government can change the balance of social forces by its support, or withdrawal thereof, for one or the other social group or ideological force, thereby conditioning, if not always determining, the political outcome. In a country the size and plurality of India, prejudices are aplenty—some naive, others hostile. The problem arises precisely when government shows bias through its acts of commission and omission, indicating an ideological preference for one or the other.

Before proceeding any further it is necessary for me to make clear my assumptions. Two things are noticeable about contemporary Indian society. First, a strong anti-backward caste and anti-dalit sentiment has surfaced under the guise of opposing reservations. Second, prejudices have sharpened differences along religious lines. While the former gives vent to fears about

divisiveness, the latter is perceived as proving that religious loyalties supersede all other commitments. The terrain on which this is happening is an economic policy which promotes greed and graft at the expense of commitment to the disadvantaged sections of the population. The apprehension that dalit-backward classes assertion with Muslim support will undermine upper caste/class dominance informs the emphasis on unity. It is not surprising that commonly-held opinions of the privileged caste/class get passed off as perceptions of an entire community, either religious or political. Upper caste prejudices are presented as defence of the democratic principles of equality and merit, while Hindu communal prejudices lend weight to the opinion that in matters of belief, one has to tread carefully. The incapacity of the democratic perspective to hold its own and respond to this challenge bolsters assimilationist and xenophobic perceptions. They make their appearance as 'nationalism' and mobilise support in the name of their version of the nation's interest or its pride. It follows that isolating the nation's enemies and upholding national unity become holy cows. The augmentation in coercive powers of government is no accident, just as Muslims are the easily identifiable enemy for both bigots and chauvinists.

In accepting the primacy of religious communities, political explanations encourage motivated readings of events and situations; the government's policies and pronouncements appear at their worst as aberrations. That is to say, their role in delineating the boundaries of 'us' and 'them' appear as pragmatic response to prevailing conditions and not as a key contributor to the formation of the conditions themselves. This stands out when one considers the dilemma of the Indian Muslims.

The discrimination against Muslims in public life is clear from their low representation in government and corporate sector employment. Participation in trade and professional services is minuscule. Because their access to government and private finances is limited, their conditions of existence do not improve. Instead of

addressing this problem, the government asserts the superiority of the religious clergy, thereby aggravating disabilities, which ends up strengthening the stereotypical view of the Muslim. Be it the exclusion of Muslim women from right of maintenance; or the official support for the formation of the Muslim Personal Law Board in 1985; or concessions of a symbolic nature such as the introduction of a 10-minute Urdu news broadcast on Bangalore Doordarshan; the government's policy of non-interference helps perpetuate debility. In other words, separateness is not only emphasised but promoted.

The interesting thing is that, simultaneously, encouragement is given to efforts which dilute all types of differentiation among Hindus. This is done through the use of religious symbolism as well as the arousal of patriotic passions. Let us recall that while everyone was engaged in debating the Shah Bano case, the government facilitated the opening of the doors of the Babri masjid to appease the Hindu chauvinists. Few realise the importance of the officially approved VHP's 'dharma sansad' at Allahabad during the Kumbh Mela in 1986, where the decision was announced to demolish the Babri masjid, which culminated in December 6, 1992—bringing us perilously close to civil war.

This is where the antagonism towards Pakistan acquires meaning. With the government harping on Pakistan's alleged 'proxy' war in Kashmir, support for insurgencies in different parts of the country, and the complicity of the ISI in acts of terror by so-called 'anti-nationals', an oblique link is made between an enemy outside with enemies inside. Let us recall that the RSS always questions the loyalty of Indian Muslims by stressing the Arabic origins of Islam, and points to the religious and kinship links of Indian and Pakistani Muslims as a potential threat. The election commission's (EC) admission that the deletion of the names of 'foreigners' is based on central intelligence reports demonstrates how uncorroborated evidence is concocted to match this lie. The public knows nothing about such reports but the Sangh parivar has access to them, and on their representation the EC promptly undertakes the exercise aimed at disenfranchising Muslims in particular, and other minorities and dalits in general. It is therefore necessary to explain the vital role played by the manufacturing of threats, generation of insecurity, and misrepresentation of issues.

ONE STEP SIDEWAYS

The remarkable thing about the prime minister's independence day speech was his insistence that "the unfinished task is that Pakistan-occupied Kashmir should be ceded to India". In response to this, the BJP declared that the government has been unable to stop

the arming of Kashmiri militants and prevent the "spread of the ISI networks", and that it could "not rule out the possibility of a conflict" with Pakistan. In this dialogue between the hawks even dispassionate observers see this as evidence of 'national consensus' requiring no further debate.

It is here that allegations against the ISI become significant. These emerged during the anti-insurgency operations in Punjab and subsequently Kashmir, but the preoccupation with getting Pakistan declared a 'terrorist state' by the US gave this task urgency. In blaming the ISI for the Bombay blast, and the Indian army chief B C Joshi's claim that the ISI paid Somalis to attack Indian troops, the projection of the ISI as a larger-than-life organisation became complete. Not only was it convenient for the government to deflect attention from its own perfidious role during the demolition of the Babri masjid and the carnage of Muslims, but it also provided a stereotypical image of an easily identifiable enemy both outside and within the country, i.e., Pakistan and by association Muslims.

This association of Pakistan with Indian Muslims has not been denounced by the government. On the contrary, the ministry of defence in its annual report for 1993-94 speaks of "several anti-India groups...being used to engineer communal violence" by Pakistan. Considering the overwhelming evidence of anti-Muslim carnage the reference to "groups" is a euphemism for Muslim groups. Whatever ambiguities were there, were removed when the army issued a self-serving statement on the attack by 50 jawans of the 9th Garhwal Regiment at Langar Hauz police station on February 2. It was claimed that "the hand of Inter-Services Intelligence of Pakistan or some anti-national elements in the setting of the houses on fire cannot be ruled out. Its link with the gruesome murder to provoke the army is also plausible". Whitewashing the criminal deed did not stop here. A press statement by the army in Tezpur bemoaned the "spread of Muslim fundamentalism among immigrants". It voiced concern that "ULFA is recruiting Muslims... to please their members - Bangladesh-based agents and Pakistan's ISI". That this feeds the anti-minority hysteria being generated by the Sangh parivar is also clear from the fact that there is no official mention of the threat posed to the country by communal-fascism which time and again has brought India to the brink of major crisis, sapping it of the strength to withstand external interference.

This paves the way for fantastic claims to make their appearance in print. For instance, a leading economic daily (*The Economic Times*, March 4, 1994) carried a New Delhi datelined story alleging that a joint venture between Nepal's Himalayan Bank and Pakistan's Habib Bank will lead to the

financing of "clandestine activities" against India; that the bank will be a conduit for the ISI; etc. It was shown that the story was full of inaccuracies, but the proliferation of such stories has fed into anti-Pakistan hysteria and their refutation does not undo the damage.

In Hyderabad during the recently held Ganesha Chaturthi, addressing a large crowd VHP leader Sadhvi Rithambara made a provocative and incendiary speech threatening to convert every mosque into a temple, and said that some blots on the country cannot be washed by water but require blood. Such verbal violence evoked no response from administration; but in the same city allegations by the RSS can result in deaths.

A BJP leader and VHP activist Nandraj Goud and Paparch Goud were killed sometime in June 1993. The Sangh parivar promptly accused "ISI backed terrorists". The police killed three young Muslim men and said the "killers" of the BJP leader were shot dead. Now the wife of the slain BJP leader Lalitha Goud in a public statement has blamed a group of BJP leaders for killing her husband and said that she had herself told L K Advani, who airdashed to Hyderabad last year, of this fact. Despite knowing this Advani went on to accuse the ISI of the killing. The alacrity with which the police went on to kill three young men on RSS allegation and their own suspicion, says something about the mutually beneficial ties between the police and the Sangh parivar.

Indeed, government agencies do not hide their communal prejudice. Army headquarters issued an order on April 25, 1994 discounting leave for Friday prayers by Muslims. The order said that it was withdrawing "all such concessions which might be regarded as a communal nature". Ironically on October 8, 1992 the same army headquarters had said that "the ministry of defence has clarified that one hour for prayers will be allowed to Muslim employees on Friday with pay". The strange thing is that the army is not asked to explain why there is this sudden awareness about concessions of a "communal nature". Why single out the Muslims when religious appeal forms the basis of armed forces training of jawans?

While the ISI becomes an omnipotent force, the calibre of evidence linking it to Indian Muslims is too poor to carry any convention. The latest instance of the central intelligence bureau-led raid on the famous Lucknow Islamic institution, Darul Ulum Nadvatul Ulema, for apprehending alleged ISI agents, only confirms the need to interrogate the ideology of internal security. It should be noted that when anti-Muslim fervour is aroused, the demand for serious evidence in support of such claims is suspended. It would not be unreasonable to read into this the actuality of antipathy towards Muslims, the most poignant

expression of which is manifest in the issue of Babri masjid.

AND TWO BACKWARD

Considering that the demolition of Babri masjid horrified people at home and abroad, not much has been done by way of rectifying the wrong. The only reference in P V N Rao's public meeting at Delhi on July 14 was that the VHP-backed trust will not be allowed to build the temple; not once did he refer to the demolition of the Babri masjid - not surprisingly, since vandalism has been sanctified right from the beginning. When the wounds were still fresh, justice H N Tihari of the Allahabad High Court ruled that 'darshan' of the Ram idols be allowed, and the state government then under central rule did not bother to challenge the judgment. Through an act government acquired the 2.7 acres of land on which Babri masjid stood; this not only took away a place of worship that belonged to Ayodhya Muslims but under the act the government empowered itself to transfer this property to another community! Little has been done for rehabilitating the Muslims. Instead, just when a semblance of normalcy was creeping in the local administration promptly served notices on those who had begun rebuilding their homes, for constructing without municipal permission. Yet again, with the excuse that ISI-trained Kashmiri terrorists might strike somewhere in Ayodhya, Muslims were asked to inform local thanas if guests arrive to stay with them. The incongruity of killers walking free and their religious sensibilities considered at a premium, while victims were being harassed, has escaped comment.

Ayodhya has become the hallmark of our claim to be a civilised democratic country. Hardly anyone voices the demand for reconstruction of the mosque, let alone that the guilty be arrested and prosecuted. Some use the specious argument that Muslims would much rather forget it, while others feel that the better course is to be cautious lest it provides a "handle to the Sangh parivar to mislead the people". There are indeed a few who even express the apprehension that since "opinion polls" show that Hindus oppose reconstruction, to go against the majority view would be politically suicidal, and that the RSS would incite trouble and disturb 'communal amity' which today is the highest priority. All therefore end up pandering to the Sangh parivar, the result being that none feels that justice and the rule of law are the bedrock of democratic functioning and that any dilution in this stance would be to countenance government's violation of its constitutional duty. As a result the government is allowed to create the illusion that Babri masjid is a non-issue; that the issue is the 'structure' that existed; and that government was not a party to the demolition. As a result, until

the formation of the SP-BSP government – which incidentally won all the assembly seats from the Faizabad-Ayodhya area – little was done to restore hope among the local Muslims.

Another instance of the government kowtowing to Hindu chauvinism is available from the formation of a “non-political” trust; in bringing this about, the prime minister’s office and senior officers were directly involved. Last March the PM himself met the shankaracharya of Dwarka and Jyotirpeeth, Swaroopanand, and mooted the idea of the clergy constructing the Ram temple. The shankaracharyas has long been the key to Congress efforts to usurp the Sangh parivar’s Ayodhya plank. In this game of one-upmanship the shankaracharyas not only insist that they too will not abide by the Supreme Court’s judgment but that the sanctum sanctorum will be the same as earmarked by the VHP. There is little difference between the two ‘trusts’.

What this implies is the conspicuous absence of efforts to undo the wrong. There are several points of law involved. The entire land including the area surrounding the demolished Babri masjid vests with the waqf board. The central government acquired a little over 67 acres of land in and around the site through a presidential ordinance in October 1990. Portions of this land were already the subject of dispute before the Lucknow bench of the Allahabad High Court. In January 1993, the government acquired all this land and imposed the status quo which sanctified vandalism. It then went on to request the Supreme Court for its “opinion” on “whether a Hindu temple or any religious structure existed prior to the construction of the Ram Janmaboomi-Babri masjid in the area on which the structure stood”. This is after the Sangh parivar demolished the mosque, set up a makeshift temple, and conducted anti-Muslim carnage in various parts of the country. Instead of rejecting its maintainability, the Supreme Court after a length of time asked the government to stop making “off the cuff remarks” and make “explicit” if they will abide or not by the “opinion”. The government refused to commit itself to building a mosque even if the Supreme Court ascertains that no Hindu temple existed before the construction of the Babri masjid.

The statute of limitations itself would have been enough to dismiss the reference sought; therefore one cannot ignore the implications of asking the judiciary to adjudicate on fabricated myths which form the basis of the RSS’ outrageous claims. While the Supreme Court rejected the “reference” it did declare that the faith of Hindus is superior, never mind the criminal conspiracy that resulted in the demolition of a mosque. It did so by completely ignoring the original crime of December 1949; by describing the criminal act of planting idols as “shifting of the idols”;

by upholding the right of Hindus to offer prayers; and by claiming that Muslims do not require a mosque to offer ‘namaz’. What is more is the absence of contempt of court proceedings against the Sangh parivar, either by the court or the government, thus suggesting that violation of pledges given to the highest court and the act of vandalism is of no judicial concern.

Apprehensions that justice is being devalued are reinforced if one also looks at the Justice Liberhans commission, set up in December 1992 to investigate the demolition of the Babri masjid. Before it even began working there were moves to dissolve it last January; after the news was leaked the government backed down, but the commission is working at an indifferent pace. It took the commission one year to get its act together and issue notices to various parties. As a measure of our resolve the media does not even cover the proceedings of the commission as and when it convenes. The government provided a list of 57 witnesses to depose before the commission. How many witnesses have deposed, approximately how long they will take to complete the investigations, and by when they will submit their report to the government, are not known.

With those implicated moving about freely, free both to continue with their inciteful activities and to wipe out evidence, the government is engaged in wiping out the memory of what led to, took place during, and followed the demolition of the Babri masjid. The failure to provide justice bolsters the feeling among Muslims that their plight is on account of their Muslimness, and that the government will do its utmost to placate the victimiser because of religious affinity. This not only aggravates polarisation around religious lines, but it helps the Sangh parivar to rehabilitate itself in civil society by making its crimes against the minorities appear as mildly disagreeable.

REHABILITATING THE AGGRESSOR

Since the RSS is seen as a Hindu nationalist force, in confronting the challenge posed by it decision-makers make concessions, blunting the struggle against them. No matter how violently anti-Muslim they may be, since nationalism is not a pejorative term their patriotism is regarded as above question. In this sense not only does the RSS get politically rehabilitated but its ideological campaign receives a boost. It is then convenient to push the argument that the RSS cannot be wished away and that different means have to be adopted to contend with them.

Seen thus, the casual manner in which the government has gone about first banning the RSS and its front, forming a tribunal headed by a judge who dismissed testimony of key eyewitnesses, and then ensuring a weak case

which no court could uphold, was no more than a temporary discomfort. This enabled the Sangh parivar to bounce back politically. The VHP remains banned in name only and is without let or hindrance free to conduct its vicious campaign, including openly threatening to initiate a call for destroying the Gyanvapi mosque in Benares and Jami masjid, Mathura. The Bajrang Dal boldly announces the start of its ‘military operations’ to “rescue” cows from May 22 when Muslims celebrate Id-ul-Zuha. In fact, when the Sangh parivar staged a protest in Punjab against Punjab Meats (September 23) on the ridiculous grounds that Indians are “vegetarian”, the state government-owned plant management made it known that the plant would not be commissioned without consulting the “aggrieved organisation”, i.e. Sangh parivar. It is then not surprising to read of the ruling party giving Atal Behari Vajpayee, leader of the BJP in parliament, the GB Pant award for best parliamentarian – an exhibition of its ideological proximity with the RSS. He also was chosen to head the delegation which went to defend the government’s abhorrent human rights record in Kashmir.

CONCLUSION

Taken as stray instances these appear to form no pattern. Nevertheless, they cannot be brushed off as exaggerations or as reading too much into them – what they express is a deliberate promotion of an enemy image, where after a point distinctions among Pakistan, the ISI, Muslim fundamentalists and Indian Muslims get blurred. The acute sense of insecurity generated among Muslims is the other side of the suspicion about them planted in the minds of the rest. Whereas propaganda about the ISI compels Muslims to give proof of their loyalty, the government’s handling of the Babri masjid issue becomes a reminder that the democratic space within which they thought they existed has shrunk to a point where even brazen discrimination evokes little outrage. That this provides a handle for those who have a stake in perpetuating hostility towards Muslims is obvious. But the underplaying of such by secular democrats politically isolates the minority. For instance, the plight of the young girl Ameena married to an old Arab rouses the middle class conscience, whereas the marriage and rape of Anita last May goes unnoticed. Or else Muslim fury over *Satanic Verses* becomes a ready refrain but there is no fury over the code of conduct imposed on the Hindi film industry in which no one can condemn the demolition or the demolishers of the Babri masjid or mock at Ram, Sita, etc. This dichotomy in attitude is clear when the so-called Muslim intelligentsia meet receives a pat on the back without anyone bothering to ask if there is not a need for the Hindu intelligentsia meet

too? The question is not if one wrong makes the other right. It is the consistency with which Muslim issues, events, and personalities become stereotyped symbols and reappear as self-evident facts.

To place the threads of the argument together, what becomes important is that the policies and pronouncements of the government have played a preponderant role in perpetuating and promoting community differences. The deliberate ambiguity maintained by the government between the ISI and Indian Muslims in no way stops anyone from arresting, torturing or killing under mere suspicion or accusation. Discrimination apart, a feeling is created that Muslims are being singled out for humiliation and attack. The EC-led move to delete the names of Muslim voters shows the advancing of 'Hindutva' ideology, if not the appeasement of the Sangh parivar. In such a climate, when political parties and other corporate bodies take the posture of being against all kinds of communalism and are unable to make a distinction between victim and victimiser, then faced with private and government coercion community solidarity gets a boost. As a corollary, under the refrain of fighting "all types of communalism", the threat of the RSS gets muted.

This is enough to cause Muslims to become reluctant to express their views in public meetings, for example, when the Babri masjid issue was brought up; and few dare to condemn the terror let loose in Kashmir lest they be accused of disloyalty. This hesitation is a measure of the attempt to silence and disarm them, to sharpen their feeling of being different – and all this is cynically used by the government to its own ends.

This tends to provide the rationale for ideologies of identity politics. While one side sees the need for this in view of its persecution, the other side sees it in being privileged; to the extent to which one group feels constrained, the 'other' feels emboldened. If this appears to be a zero sum game it is not surprising – this is how it is perceived by various public and corporate personalities. Just as the government's discrimination emphasises Muslimness, the official endorsement for key elements of the Sangh parivar agenda acts as a fillip for 'Hindutva'. While it appears that each feeds into the other, in reality the two sides are unequal; one is persecuted and the other privileged.

The remarkable thing is that an alternate course was possible. The government could have, instead of mollicoddling the Sangh parivar, opted for restoring people's belief in the fairness of public institutions and desisted from pandering to religious sentiments. In reading criminal activities as acts of faith and the faithful, gross democratic rights violations were condoned. Since the struggle for democratic rights did not remain at the centre of Indian politics after the emergency, overarching principles of rule

of law got discounted in the name of a hierarchy of interests, in which 'national interests' as defined by the rulers become sacrosanct. The phobia about the threat to independence and the evocation of the imagery of fifth columnists always deflates the importance of internal freedom. Consider that the army headquarters has set up several task forces for areas where insurgency is said to prevail, as well as a special group for monitoring the communal situation. No one asks why the army with its evident bias should be engaging itself in police matters. Such slippages question the commitment of the Indian ruling classes to democratic functioning. If the struggle for democratic

rights remains alive it is due to movements on the periphery of 'mainstream' politics. Indeed, democracy in the minds of articulate sections is becoming associated with lawlessness, and popular scepticism about the conduct of politics is read as apathy and cynicism. This is often attributed to the alienness of 'western' political concepts and institutions in India, especially when discussing secularism and the concomitant insistence that religion be separated from state. This political climate is tailor-made for the generation of fear psychosis, which tends to obfuscate social differentiations and allows the special interests of the ruling classes to retain their dominance.

Russia's War of Attrition in Chechnya

P L Dash

Though Russia may eventually subdue Chechnya, the prolonged war has exposed the authoritarianism of Yeltsin.

IN recent years, Decembers have visited Russia with a distinct difference. In 1991, it was the Soviet disintegration. In 1992, it was the climax of a classic clash between the president and the parliament. In 1993, it was the emergence of ultranationalist phenomenon of Vladimir Zhirinovskiy, and in 1994, it was the Chechnya war when in December 1994 Moscow failed to strike an accord with Grozny on the limits of Chechnya's autonomy within the Russian federation, clouds of war began to hover over Northern Caucasus. What began purely as a political tussle between Moscow and Grozny in 1991 turned into a savage war in 1994-1995. Yeltsin faced a dilemma: to attack or not to attack. The fears of separatism spreading from Chechnya to other non-Russian regions, the strategic interests of Russia in the Caucasian southern rim, the economic factors connected with the gas pipeline, a major highway and rail line running through Chechnya, and salvaging Yeltsin's own plummeting popularity were major factors responsible for Russia's entanglement in Chechnya.

After too much of insult and injury, Russia has won a partial victory over Chechnya. Yeltsin has found it extremely difficult to resolve this problem or walk away from it. The fears of acting liberal, as Gorbachev did under perestroika, might have precipitated impending dismemberment of Russia. Although this has not happened, the euphoria of behaving tough has left Yeltsin in the lurch. Saddled by these two extremities of soft and tough options, Yeltsin chose military might with cluster and needle bombs to resolve an ethno-politically sensitive conflict.

HISTORICAL BACKGROUND

Chechnya lies in the North Caucasus along Terek river. Known through the Soviet years as Chechen-Ingush ASSR, it had a combined territory of 19,300 square kilometres and a population of 1.22 million. The landmass of Chechnya falls into three geographical regions: the main Caucasus range in the south, the river valleys of Terek and Sunzha from west to east, and the rolling plains of Nogay steppe in the north. Broadly, three groups inhabit the area. They are the Chechen-Ingush who comprise 60 per cent of the population, the Russians who form 35 per cent of it and the numerous Caucasian nationalities making up the remaining 5 per cent. The ethnic composition has tended historically to create a religious divide between the Russians, who are Slavs, and the Chechen-Ingush, who are Muslims. Ever since the Persian campaign of Peter the Great in 1722 that resulted into Russian colonisation of the region, both sides have nurtured a sense of animosity on the basis of religion. It was around this time in early 18th century that the Chechen-Ingush were affirming their ethnic names. The Nakhcho tribe from the mountain village of Chechen came to be known as Chechens and the Galgay tribe from the village of Angush was subsequently known as Ingush. By close of the 18th century, both these tribes were known as 'Vaynaks' [FBIS report 1992: 26].

The Vaynaks rose against the Russian dominance under the leadership of Sheikh Mansur in 1780 and were brutally quelled by the Russian army in 1789. The Chechen liberation efforts took an intense turn when Yevgeny Yermolov was appointed governor general of the Caucasus in 1816. He speeded

up the colonisation process after successfully annexing Azerbaijan and Georgia. Yermolov wrote in his memoir, "Along the lower reach of the Terek river live the Chechens, the fiercest of the brigands, who attack the line... They can justly be called the liar of all brigands" [FBIS report 1992:27]. In the face of mounting Russian attacks, the Chechen-Ingush had formed 'abrek' or mountain bands who continued the guerrilla warfare against the Russians till the fall of the tsarist empire in February 1917. After October 1917 the bolsheviks made sustained efforts to bring peace to this region. Four months of talks ended in a peace agreement in February 1918, establishing Soviet power in Terek Oblast.

The Soviet power consolidated in Chechen-Ingush in three stages. In the first stage the Soviets regained control over the region by defeating the white guards in March 1920 and set up Gorskaya Autonomous Republic in November 1920 that included Chechen-Ingushetia. Two years later, in the second stage, Chechen Autonomous Region was created followed by the establishment of Ingush Autonomous Region in July 1924 [Biryukov nd: 96]. The intervening time between 1924 and 1935 witnessed two opposite tendencies: The unifying efforts of the Soviet power that aimed at merger of the two regions, and the anti-collectivisation drive. Anti-Soviet uprisings against the ruthless methods of collectivisation continued to wreck havoc until 1934, when the Soviets succeeded in creating a combined Chechen-Ingush Oblast with Grozny as its capital. In the third stage this Oblast was transformed into Chechen-Ingush Autonomous Republic in December 1936.

After the consolidation of Soviet power, repression against anti-Soviet elements became severe. In August 1937, a special operation was conducted in which "more than 10,000 people were arrested in Chechnya, Ingushetia and in the city of Grozny. Numerous trials were held and virtually all leaders were arrested" [FBIS report 1992:28]. In second world war the Chechens and Ingush suffered further misery at the hands of Joseph Stalin. They were deported to Central Asia and their republic dissolved. In 1957, Nikita Khrushchev restored the Chechen-Ingush Autonomous Republic and resettled its deported inhabitants. However, some of the territories of Chechen-Ingushetia were annexed to neighbouring regions such as Stavropolskii Kray, North Ossetia, Georgia and Dagestan.

GENESIS OF CRISIS

The imprints of Gorbachev's perestroika on Chechen-Ingushetia were felt belatedly. Communist party chief, Vladimir Foteyev, and his deputy, Pavel Gromov, enjoyed full powers and controlled Chechen affairs. In

1988 when glasnost permeated to the grass roots, criticism of communist ideology and the functioning of the leadership became prominent. Relative freedom of the press brought to light public dissent. Like in other republics of the former Soviet Union, issues of democracy were taken up along with ecological problems faced by Chechnya. In February 1988, a construction engineer of the Gudermes Biochemical Plant, Ruslan Ezbulatov, published information about his plant producing lysine, a health hazard for Chechnya. This information sparked revolt in the republic. Mass demonstrations demanding ban on the production of lysine followed. This was the genesis of confrontation between the communist authorities and the democratic public. In April 1989 Doku Zavgayev was elected as the deputy, who subsequently became party first secretary in June 1989, thus ending the era of Foteyev.

On November 23-25, 1990 Zavgayev organised the Chechen National Congress in Grozny. The demand for Chechen sovereignty dominated discussion in the congress and Zavgayev promised to promote national rebirth of Chechnya. By the winter 1990 a number of nationalist parties such as the Chechen Popular Front, Islamic Party of Rebirth and Islamic Path Party were active. While the government of Zavgayev was pursuing a centrist policy, the nationalists were pursuing the objectives of Chechen independence. Conflicting views of the leaders of these parties led to infighting within the Chechen National Congress in December 1990. Around this time Major General Dzhokhar Dudayev was elected the chairman of the executive committee of the Chechen National Congress. This was the beginning of the confrontation between the centrist Zavgayev, who followed the Gorbachevian course, and the radical Dudayev, who followed the Chechen nationalist course. The August coup in Russia hastened the pace of Zavgayev-Dudayev conflict. The climax came on September 1-2, 1991 when the congress met in Grozny and declared the Chechen Supreme Soviet overthrown. It handed over powers to the executive committee of the Chechen National Congress led by Dudayev [FBIS report 1992:37].

The following months were hectic. Yeltsin at the helm of power in Kremlin knew the danger of Chechnya separatism, and sent Ruslan Khasbulatov and Gennady Burbulis to negotiate with Dudayev. Meanwhile, on September 15, 1991 Chechnya and Ingushetia were separated as independent republics. Dudayev headed for presidential and parliamentary elections slated for October 27, 1991. When Dudayev was elected president of Chechnya and his National Congress won a landslide victory, Moscow quickly declared the results of

elections unlawful and started to create hurdles for Dudayev. Thus, long before the Russian invasion began last December, warfare was going on between pro-Kremlin and pro-Dudayev forces for the past three years. The Russian president, on the threshold of Soviet disintegration in 1991, imposed an emergency only to rescind it two days later. This resulted in the withdrawal of Russian army units from Chechnya. However, Moscow's surrogate, Umar Avturkhanov, a rich Chechen merchant, was elected the mayor of Nadterechny district in December 1991 and Moscow pursued its policy of proxy war through him in Chechnya. Ever since the pro-Moscow opposition formed a provisional committee headed by Avturkhanov in June 1994, Moscow supplied 40 billion rubles in cash, besides a fleet of 70 tanks and combat gunships with crew [Moscow News Weekly December 2-8, 1994]. Despite all these odds, Dudayev continued to consolidate his power.

When all 15 constituent republics of the former Soviet Union became independent, Dudayev failed to understand why his tiny Caucasian state with its distinctive heritages should not become independent. He pursued the matter vigorously with Yeltsin who throughout his presidential campaign in 1991 summer had consistently advocated that Russia had no imperial ambitions and that every constituent unit of the Soviet Union had the right to become sovereign and independent. This right was in fact embodied in the Soviet constitution. In 1992, some new Chechen leaders like Beslan Gantemirov, Yusup Saslambekov, Ruslan Labazanov and Yaragi Mamodayev joined hands with Dudayev. Mamodayev subsequently became the prime minister of Chechnya and resigned when Dudayev dismissed the parliament in the spring of 1993. After the parliament was dissolved, Gantemirov, Labazanov and Avturkhanov spearheaded the opposition while Dudayev headed the Chechen government. Open clashes between the two groups continued intermittently. The opposition sought Moscow's active support to restore constitutional order in Chechnya. Despite Moscow's generous support, the Labazanov faction was routed on September 3, 1994, at Argun. On November 26-27, 1994 Dudayev's forces were able to do away with the opposition. Thereafter, the Chechnya crisis took the form of direct confrontation between Moscow and Grozny, and between Dudayev and Yeltsin.

DIFFERENT PERCEPTIONS

No sooner did the crisis in Chechnya begin to unfold, it became clear that there existed differing views not only on the conduct of military operations, but also on the constitutional issues. Yeltsin was guided

by his constitutional provisions. Article 42 of the Russian constitution says, "The state unity of the Russian Federation will be secured by the integrity of its territory... and the territory of the Russian Federation will be integral and indivisible". Since Dudayev threatened this integrity, Yeltsin considered him a gangster, and not the president of Chechnya. On the other hand, Dudayev did not consider Yeltsin a Russian citizen nor Chechnya a part of Russian federation. At a time when most voices of secession had receded, Chechnya's revolt threatened to unleash another phase of breakaway syndrome.

Where Yeltsin vastly differed from his colleagues was whether or not to use military force to settle the three year-old political and territorial dispute. Yeltsin favoured using force whereas his fellow Russians disagreed. Nearly all Duma members opposed invasion. They wanted the issue to be negotiated with Dudayev. Disillusioned with the attitude of the Duma, Yeltsin invited the upper house or Federation Council to consider three questions: (1) Should the Russian constitution continue to apply to Chechnya or is the council prepared to amend the constitution to let Chechnya secede? (2) If the government is to negotiate with Dudayev, as nearly all of the parliament wants, is the parliament ready to rescind measures that call Dudayev's regime illegitimate? (3) If there are to be elections in Chechnya, as some propose, what are the circumstances in which they could be held? [*Economist*, December 1994].

After a lengthy debate, the house was near unanimous about a peaceful solution and members urged the president to grant amnesty to the Chechens, if they surrendered their arms before December 15, 1994. The ultimatum was of no avail and Yeltsin decided to use the military. To Yeltsin's embarrassment the commander-in-chief of the Russian armed forces, General Eduard Vorobyov, tendered his resignation, refusing to assume control of the Russian military operation in Chechnya. At least five generals expressed their reservations about the campaign [*The Times of India*, January 7, 1995]. The generals categorically warned the president that the mission in Chechnya was not going to be smooth. A group of deputies who visited Chechnya to negotiate with Dudayev sent telegrams to the president to immediately stop the assault even after their peace talks with Dudayev broke down. Yeltsin's dithering perceptions were clearly evident when he informed his countrymen on the Russian television, "the first stage in settling the crisis has been completed and the ring around Grozny was tight" [*Time*, January 9, 1995].

However, eyewitness account on the eve of the Chechen expedition was different. It conveyed to the people the debacle facing

Russia and the possibility of a protracted guerrilla war. The Russians became circumspect of their president when the chairman of the human rights commission, Sergei Kovalev publicly remarked that blood was being spilled in Grozny not to solve the Chechen conflict but to drain the strength of Russia's weak democracy. The Russian defence minister, Pavel Grachev, was overconfident of winning a mini war over little Chechnya. He grossly undervalued the strength of the Chechen fighters and their fervour to uphold Chechen nationalism. Grachev seemed more loyal to Yeltsin than to ground-level reality. Mounting criticism came from all quarters as reports of initial failures trickled in from Chechnya. Russian orthodox patriarch Alexei II stated, "no one can remain indifferent to the death of peaceful civilians". Former president Mikhail Gorbachev called the war "a bloody and disgraceful adventure". Pro-Yeltsin reformist-democrat, Grigory Yavlinsky told Yeltsin; "Boris Nikolaevich, resign! Do not wash Russia with blood" [*Time*, January 16, 1995].

RUSSIA'S INTERESTS

Several factors forced Yeltsin to take recourse to the option of force. Strategically, Chechnya is located in Russia's Caucasian southern underbelly between the Caspian and Black seas. The region as a whole has remained tumultuous in post-Soviet times. The ethnic Armenians have been fighting with the Azerbaijanis in Nagorno-Karabakh conclave for the past eight years. Independent Georgia has been beset with the problems of Abkhazian and Adzharian separatism. South Ossetia has been demanding to secede from Georgia to unite with North Ossetia that constitutes a part of the Russian federation. Moscow has policed a truce between the two since 1991-92. The split of Chechen-Ingushetia in 1991 has created two separate entities in place of the earlier Chechen-Ingush ASSR. All these developments have remained strategically disquietening for Moscow. The propensity of such low intensity ethnic conflicts have severely jeopardised Russian interests in the region. In view of all this, events in Chechnya were not worth ignoring.

Politically, the Caucasus has remained unstable too. In the smallest of former Soviet republics, Armenia, president Levon-Ter Petrasyan has been carving out his own niche of democracy. In Azerbaijan, turbulent political events have swept to power former communist Gaidar Aliiev, and in Georgia former Soviet foreign minister, Eduard Shevardnadze is having a tough time. These leaders are no longer able to safeguard Russia's political interest in the region as trusted allies. At this juncture, Russia's total withdrawal from Chechnya is bound to facilitate further instability in the region.

Leaving Chechnya to follow its own course will have far-reaching constitutional and political repercussion in Russia.

Economically, Russian interests in Chechnya are in the gas pipeline that runs westward through Chechnya from the Caspian basin. There are also vital transport links. The Moscow-Baku highway and railway run through Chechnya. Chechnyan independence will sever Russia's vital transport links with the Caucasian states. This will cause severe economic constraints for Russia and in the region. Yeltsin wished to prevent this happen. Thus, a combination of strategic, geopolitical and economic factors has driven Yeltsin to engage troops in Chechnya.

Critics, however, relate a different version. They feel Yeltsin's Chechnya invasion is "a badly miscalculated attempt to boost his own sagging popularity. Yeltsin's approval rating in opinion polls has slipped to less than 40 per cent, down more than 20 per cent from a year ago" [*News Week*, January 9, 1995]. According to the Russian centre for public opinion and market research the forced march to Chechnya was condemned by 57.7 per cent Russians on December 5-6, 1994 and by 69.9 per cent on December 11-12, 1994. Defence minister Pavel Grachev's intention was to cover up widespread corruption in the Russian military which was brought to limelight by journalist, Dmitry Kholodov. After publication of his article in *Moskovskie Kuranty*, Kholodov was assassinated by unknown gangsters and investigations regarding the murder have run into a *cul-de-sac*. Finally, the newly liberated regions no longer obey the Kremlin command. Among the ex-Soviet republics, "Estonia declares ever more loudly its claim for the Pechorski district, Lithuania is closing the military transit to Kaliningrad, and Azerbaijan and Kazakhstan are locking horns with Russia for their rights to Caspian oil" [*Moscow News Weekly*, December 23-29, 1994].

YELTSIN'S MISCALCULATIONS

It was for the first time Russia was witness to televised live pictures of bomb-gutted buildings, burned corpses of its own soldiers soaked in blood and many pathetic scenes of wailing civilians in the midst of raging fire. Dudayev's Grozny sent to the Kremlin clear signals of an impending debacle awaiting the Russians in Chechnya. While 25,000 Russian troops backed by 300 armoured vehicles were marching to the centre of Grozny, reports of Russian tanks being destroyed in large numbers made the Kremlin shiver. After 15 days of fighting, it was reported that 1,000 Chechen troops were killed by the Russian soldiers [*The Times of India*, December 26, 1994]. The Russian casualty figures ranged between 12,000 to 13,000.

On the eve of 1995, all major Chechnyan cities such as Argun, Gudermes, Melgobek and Beslan continued to reel under Russian attack. Yet, Yeltsin was determined to continue his Chechnya war. Even when the Russian security council met to discuss the 'force option', Yeltsin began putting his proposal to vote without any discussion. Reports of military disaffection were gradually percolating from the Russian forces. General Ivan Babichev commander of Russian forces in western Chechnya, openly told, "It is forbidden to use the army against peaceful civilians. When I see the faces of these old women, it is as though I see the face of my own mother" [*News Week*, December 26, 1994]. Despite these reports, Russia continued its battle for Grozny, and after it succeeded in occupying the presidential palace, it found that Dudayev was missing. Dudayev probably had fled southward to the mountains to continue guerrilla war against the Russians.

As the military adventure in and around Grozny began to unfold, the vacillations of Boris Yeltsin became clear. He continued to make blunders repeatedly. First, he grossly underestimated the popularity of Chechen president, Dudayev. Secondly, Yeltsin, along with Grachev, undervalued the fighting motives of Chechen patriots. Disturbed by Russia's frequent incursions into their process of nation-state building at various times in history, the Chechens, headed by Dudayev, seemed determined to teach Russia a lesson in warfare. Those army men who defected to unite with Chechen forces were critical of Yeltsin. Some pro-democracy civil and military groups and human rights activists, who were staunch supporters of the president, began criticising him for mishandling the Chechen affairs. Thirdly, Yeltsin apparently did not exercise enough caution to gauge the sentiments of the Russians. Most Russians were averse to their country being dragged into another bloody conflict. The Russians comment that what was the last war of the Soviet empire in Afghanistan has virtually turned out to be the first war of Russia in Tajikistan. Enmeshed in an ongoing civil war in that Central Asian state, the Russians are fearful of another military entanglement. However, Yeltsin failed to realise what his countrymen had been increasingly feeling about. Fourthly, the Russian president had underestimated the Islamic undertones of the Chechen conflict. The organisation of the Islamic Conference that met in Casablanca in December 1994 endorsed the independence of Chechnya. Moreover, only after the reports of initial failures in Chechnya reached the Russian authorities that they realised that mercenaries from several Muslim countries like Afghanistan, Pakistan, Azerbaijan and Jordan were fighting with Chechen forces.

DUDAYEV'S STRENGTH

The fears, vacillations and miscalculations of Russia were known to the Chechen president Dudayev. As a top military personnel of the ex-Soviet army he knew the intricacies of Russian decision-making at the time of military crisis. As a commander of the strategic bomber division in Tartu, Estonia, and as a soldier privy to armed opposition to popular protests, Dudayev had gathered more experience than Yeltsin. He combined this rich experience with his expertise as a pilot engineer and major general while managing the crisis in Chechnya. However, the mainstay of his military support came from the armed forces of the Chechen republic, which he had formed on November 10, 1991 under his own chairmanship. On December 24, 1991 he also introduced a law for the 'Defence of the Chechen Republic'. This law introduced mandatory military service for all male citizens of the republic aged 19-26 years for a period of 18 months and those with higher education for a term of 12 months. The law also mentioned that anyone who does not wish to serve in the armed forces out of religious conviction must do labour service instead of regular duty [*FBIS report 1992:6*].

This law has placed under the disposal of the Chechen leadership the following units to carry out military missions: the president's personal guard of 30 to 50 men, two special purpose platoons of 50 men each, a detachment of the Islamic Path Party of 200 men, a headquarter defence platoon of 50 men, the border custom service regiment of 1,200 men, the mountain peoples' quick response forces of 100-150 men, the internal affairs ministry special forces of 50 men, and the Chechen national guard of 10,000 to 15,000 men [*FBIS report 1992:6*].

Ever since he came to power in the autumn of 1991, Dudayev has been veering his little state in Caucasus to total independence. War with Russia had become inevitable. In a bid to quickly enhance Chechnya's defence capabilities, Dudayev has made constant efforts. Most notable among them was his effort to possess Russian arms and ammunitions located on Chechnyan territory as of mid-1992. After he declared Chechnya independent, Dudayev insisted on evacuation of the Independent Military Training Centre from the region. The commander of the North Caucasus Military Area, General A Shustko, in a coded message requested Russian defence minister, Pavel Grachev to endorse his request and permit him to transfer some ammunitions to Chechnya as follows: 50 per cent of combat equipment of arms, 2 standard supplies of ammunitions, and 1-2 per cent combat engineers' ammunitions [*Moscow News Weekly*, January 20-26, 1995]. The sanction was given by Mikhail Kolesnikov, the current Chief of Russia's

General Staff. This action implied that Russia *de facto* recognised the Chechen republic headed by Dudayev.

Dudayev's support base continued to widen with the onset of Russian attack on Chechnya almost in an equal fashion as Yeltsin's rate of popularity declined in Russia. People living in Chechnya were awestruck by the ferocity of the Russian attack. Irrespective of their nationalities, volunteers came forward to fight against the Russian troops. They organised into informal bands of 20 to 50 men, elected their own commanders and began fighting in the streets with total loyalty to Dudayev. The support was so spontaneous that even a businessman, who left his home in Ukraine, used his personal funds to equip a band of 50 men [*Time*, January 16, 1995]. Chechens who lived in Russia supported Dudayev's mission for Chechen independence. Chechens living as far as in US and Canada threw their support behind Dudayev.

However, one solid base of strong support which the Russians totally overlooked was the Islamic world. The 'mercenaries' were in fact soldiers dispatched by various Islamic countries to fight against the Russians in Chechnya. This help flowed as a result of Dudayev's call for 'jihad'. Active support came not only from the neighbouring Dagestan, Kabardino-Balkaria and Azerbaijan, but also from distant countries such as Turkey and Jordan. Pro-Chechen sources said that Turkey even may close Bosphorus to hinder Russia's passage to warm waters. There were various estimates about Dudayev's financial strength. Rumours were rife in Moscow that in the bunkers of Dudayev, there were three billion US dollars, which was sufficient to pay for the mercenaries at the rate of \$ 1,000 per day of fighting [*Argumenty i Fakty 1994*]. The initial Russian retreat in the Chechen battle could be attributed to this adequate support base of Dudayev.

ADDITIONAL BURDEN

The Chechen war has now shifted gear. After the capture of Grozny by Russian forces, on January 18-19, 1995 the supporters of Dudayev have fled to the adjacent mountains. While the war has not ended, tentative estimates of loss of the warring factions have been published. They show that Chechnya expedition remains ignominious for Russia. Russian finance minister, Panskov is on record saying, "hundreds of billions of rubles have been pumped to Chechen battle". Other sources put the approximate figure at one trillion ruble [*Argumenty i Fakty 1994*]. The interrelated nature of problems involved in Chechnya makes it difficult to arrive at a sum total of Russia's financial loss in the middle of a continuing war. The entanglement for Russia has cost many

valuable human lives too. This loss is not only irreparable, but also most traumatic after Afghanistan. The continuation of the war in Chechnya makes it for Russia neither glorious nor victorious.

The war has created a major refugee problem in all neighbouring countries. The Russian migration service in the neighbourhood had registered 12,577 refugees in various republics. The Dagestan local administration had given figure of 8,500 refugees who were coming at a rate of 80 migrant families per day. As of December 19, 1994 Dagestan had registered 856 families. By December 29, the total number of people who fled Chechnya under the war conditions had touched 34,374 and it was expected to touch 90,000. In the Dagestan town of Khasavyurt 25,000 refugees, mostly women and children, took rest. Migration services spokesman, Yevgeny Chernayev revealed that the rate of refugee arrival had increased to 300 refugees per day. The mid-December refugee figures from Grozny provided by press centres of Chechnya and Ingushetia's parliaments were more than 15,000. Over 5,000 people (Chechens, Ingush and Russians) have fled to Ingushetia. 6,000 to 8,000 Chechens went to Dagestan and about 2,500 Chechens and Russians to Stavropolski Kray. The number has been constantly increasing. In the initial days of the battle, 700 people were killed from both sides, 1,500 were wounded and according to different sources 300 to 700 people were taken prisoners, including 120 Russian troops [Moscow News Weekly, December 9-15, 1994].

The loss of both sides in the combat operation was huge. On January 7, 1995 Russian defence ministry sources gave information about the Chechen losses. It said that units of Russian defence ministry had destroyed about 2,500 militants, as well as 26 tanks, 40 armoured vehicles, 63 artillery pieces and mortars, 129 vehicles, 3 MI-8 helicopters, more than 150 aircraft including 6 TU-134, 14 AN-2, 14 L-29 and L-39 planes and damaged over 100 L-29 and L-39 planes. A total of 167 firing emplacements and positions have been destroyed, 108 people taken prisoners, 340 guns, 9 tanks and 27 armoured vehicles seized" [FBIS report 1995:9]. These figures of loss not only reveal the strength of Dudayev's Chechnya, but also show his enduring capability to hold on before a much-vaunted Russian army.

Russian sources came out with further data on the war losses in Grozny in the first week of January 1995. According to them, by the end of December 1994, 2,000 Chechens and 800 Russian servicemen were killed. Other sources said 1,000 Russian soldiers were killed in the storming of Grozny. Russian Federal Migration Service put the number of refugees as of December 30, 1994 at 1,00,000 to 1,50,000. The rate

of applications received daily for migration was 2,500. Argun was completely destroyed by December 23, the centre of Grozny was annihilated and a number of suburban villages raged. The vice-president of Ingushetia confirmed that 500 Russian troops were taken prisoners in Grozny [Moscow News Weekly, January 6-12, 1995].

TEN LESSONS FROM CHECHNYA

(1) It was on the Russian territory the Russian army was deployed for the first time in post-Soviet times to launch attack on people, who are juridically citizens of the Russian Federation. These citizens are Chechen by their nationality does not minimise the gravity of the situation.

(2) By ordering army assault on Chechnya, Yeltsin has not only shown scant regards for rights of nations to self-determination, but has revealed some new features of handling sensitive ethnic matters by preferring martial democracy to democracy of consensus. Tactlessness, brutality, impatience, ruthlessness and obdurate approach are some of the features of Yeltsin's Chechnya policy that have exacerbated the crisis beyond resolve.

(3) At the most unfortunate moment of Russian history, the country has an impudent maverick like Yeltsin as president, who has created this crisis. He covertly groomed Dudayev by overlooking him for three years. And now, he has travelled his solitary path to Chechnya along with a handful of disgruntled soldiers to take revenge on Dudayev but at the cost of the common Russian.

(4) The intensity of the tragedy in Chechnya had overwhelmed even the Russian soldiers, some of whom had defected to side with Dudayev for as a matter of principle against the use of force on civilians. The arbitrariness of the presidential decision to deal with a political problem by military means without elite or mass support has revealed that Russia's decision-making process remains whimsical rather than democratic. When Yeltsin's repeated calls for a halt to bombing fell on deaf ears, doubts arose about the efficacy of his leadership and Russians questioned, "who is in control of the Kremlin?"

(5) The lessons for defence minister Grachev were devastating. As a chum of Yeltsin, Grachev has finally helped all his plans turn turtle. The crisis in Chechnya has defiled the political future of both, Grachev and Yeltsin.

(6) The long battle to take Grozny and the subsequent failure of the Russian army to capture Dudayev have evinced the weakness of Russia's political and military leadership. The echo of this weakness is likely to be heard on the ethnic frontiers of Russia which may have many a Chechnya in upcoming months.

(7) The ongoing war in Chechnya involving the Russian army will drain the country's treasury. The longer it continues, the worst it will become for Yeltsin's Russia.

(8) The Chechens are brave fighters, nay good merchants. They have used against Russia the very arms they had procured from Russia. The Russians have felt the boomerang effects of pilferage of their arms. They must learn to be ready, at least, to handle their loose arsenal cautiously.

(9) Strong support for Chechnya from the entire Islamic world tends to accentuate the wider ramifications of Russo-Chechnyan conflict. It is likely to influence the existing fissiparous risings throughout Russia and widen the divide between Slavic and Islamic peoples.

(10) Since force has little effect in democracy, arrest warrant against Dudayev may not help contain Chechnya within the boundaries of the Russian federation. Instead, it is likely to erode the fledgling foundation of Russian democracy. Chechnya has driven Yeltsin from the pinnacle of his popularity in 1991 to the nadir of his blunders in 1995. The gory memory of Chechnya will continue to haunt the Russians beyond the next year's presidential elections, maybe beyond the millennium.

However, three mutually inclusive possible scenarios have emerged recently out of the Chechnya crisis. They are: (1) The Kremlin has called for the creation of an interim administration until local elections can be held. Yeltsin has appointed deputy prime minister, Nikolai Yegorov, as his representative in Chechnya. The Kremlin has also given a two-point blueprint that envisages: (i) rebuilding of financial institutions, restoring oil facilities, paying pensions and other social welfare benefits to residents; and (ii) lobbying through the interim administration to persuade the leaders of Chechnya to hold elections [International Herald Tribune, January 21-22, 1995]. Alongside these peace initiatives, the Kremlin has unleashed terror on civilians and issued arrest warrants against Chechen leaders. (2) The second scenario is the resolute Chechen attitude to continue the battle with Russia to death. The Chechens have gone to the mountains along with their leaders and weapons to wage guerrilla war against the Russian troops. This is the most probable scenario to prevail there in upcoming months with intermittent fierce fighting. (3) The third scenario concerns a possible truce between Moscow and Grozny with Moscow recognising Chechnya's identity as a free nation. Only time will tell the efficacy of such a compromise, with or without Dudayev.

Culture and Globalisation

A Non-Issue at World Summit on Social Development

K N Panikkar

In the absence of an adequate recognition of the cultural dimension, the agenda of the World Summit for Social Development in Copenhagen next month is incomplete and ineffective as far as developing countries are concerned. The National Report of India is no better. It does not go beyond listing the achievements of the state and as such is a misleading document for any meaningful discussion. For any rethinking on social development, the implications of cultural subjection have to be taken into account.

THE background literature put out to enable and enrich the discussion at the World Summit for Social Development meeting at Copenhagen on March 11-12 almost totally ignores culture as a crucial component of the three issues of the summit's concern—poverty, productive employment and social integration—except a very tangential reference to culture in the Draft Programme of Action. The draft says that "our societies are products of unique historical evolution, enriched by diverse cultures and languages and composed of different ethnic, religious and cultural communities... Government should protect the integrity of cultures and ensure that representatives of minority groups participate fully in defining the social policies affecting their lives". The Indian response embodied in the National Report prepared by the ministry of external affairs, which is replete with contradictions and internal inconsistencies, is completely silent over the cultural question, even while discussing social integration. The very concept of social integration is lopsided and inconsistent with the preamble of the report. The social integration is conceived in following terms: "Disparities in development across areas, regions and social groups combined with low level of income have led to the existence of certain marginalised groups who need to be integrated into the mainstream development. The National Plan attempts to fulfil this task through programmes for development of women and children, scheduled castes, scheduled tribes, minorities, other backward classes and the disabled" (emphasis added). Although, what is mainstream development is not spelt out, it should be clear that integration so envisaged would impair the social and cultural specificities of these groups. The impact of the new cultural situation arising out of globalisation is likely to be more disastrous for the identity of these groups. The preamble of the National Report like the fact-sheet of the UN celebrates the right of the individual to live in a manner that suits him, yet it is completely silent about

the forces which would make such a choice almost impossible. This omission is indeed very strange, but not altogether surprising.

There is an obvious disjunction between the stated objectives and commitments of the summit and the realities obtaining in countries currently subjected to the global economic and cultural forces. The UN backgrounder on social integration claims that in "the context of sustainable human development, social integration is a synonym for greater justice, equality, material well-being and democratic freedom that implies equal opportunities and rights for all". Its manifestation, it is assumed, would foster "solidarity, inter-dependence, respect and cultural diversity and tolerance for non-mainstream life styles". At least in the realm of culture, the global context in which the summit is taking place tends to usher in a situation quite contrary to these expectations, since the cultural invasion promoted by the forces of globalisation threaten to annihilate the plurality and diversity which the summit pledges to respect and seeks to preserve. The national report has already given up tolerance for non-mainstream life, as it would be untenable with the liberalised market and globalised culture industry.

Today culture is an important component of domination, both of and within developing societies. The ideological apparatuses of state and of multinational agencies brought into being by technological revolution has ushered in this possibility. During the last couple of decades, culture industry in the capitalist west has undergone transformation beyond recognition. A very large volume of capital has gone into this industry. James Petras holds that one out of five of the richest North Americans derive his wealth from the mass media and that cultural capitalism has displaced manufacturing as a source of wealth and influence. Aided by technological innovation, particularly in the field of electronics, cultural products have swelled in volume and their scope and reach have phenomenally increased. They cannot be

contained any more within national boundaries as they are too restrictive for effective and profitable operations. Transgressing these boundaries in quest of new pastures has been made possible by the pressure exercised by capital over developing societies. Therefore, cultural imperialism is the order of the day, but at the same time, culture is being deployed as an instrument of imperialism. These two functions of culture in contemporary world are closely enmeshed, but a distinction does exist. The former is an expression of cultural capitalism, whereas the latter acts as the ideology of imperialism. Both serve imperialism and global market forces, yet the distinction is important and significant, as culture is now both a mask and a sword in the imperialist armoury.

Cultural imperialism legitimises itself on the plea that in modern times isolation is neither possible nor desirable. There is no place for closed door policies any more, as the world is moving towards a global village. The cultures, therefore, have to meet necessarily and to enrich and universalise through mutual interaction. What is happening, however, is not such an innocent process of acculturation, permitting the acceptance or rejection of cultural elements based on freedom of choice. On the contrary, the power differential inherent in economic relations determines the cultural interaction. What Gandhiji said is worth recalling in this context. Referring to the possible relationship with outside world, he had welcomed winds blowing from outside, provided it did not lead to uprooting. Such is not the situation today. The exogenous cultural presence is not only unsettling the indigenous but also trying to hegemonise it for legitimising a concept of social development modelled on the advanced capitalist societies. That no such development is feasible is effectively concealed and the underdevelopment the new economic order would perpetuate is camouflaged. The national and comprador bourgeoisie and their ideologues, either wittingly or unwittingly, and for ideological and material reasons, is a part of this imperialist project. Their collaboration, however, reinforces the process of legitimisation and helps to mask the real and mystify the dominant as the universal.

If the Draft Programme of Action is any indication, the summit does not take adequate cognisance of the contradictions in the world social order. It underlines several laudable ideas like international co-operation, dignity and worth of the human person and better standards of life in larger freedom, but at the same time refuses to confront those forces which are likely to be detrimental to these ideas. It should be evident that these forces would use the summit for furthering their ideas. Unless the summit is geared to contend with them, its deliberations are not likely to be beneficial to the developing countries like India.

REVIEW OF INDUSTRY AND MANAGEMENT

Technological Implications of Structural Adjustment

Case of India

M R Bhagavan

As a result of the Structural Adjustment Programme adopted by the Indian government in July 1991, India now operates a virtual 'open door' policy towards foreign investment and technology in most areas of industry and infrastructure. The new policy regime is likely to intensify and accelerate the process of technological polarisation between the large and small scale sectors, and high tech imports will impede the design and innovation capability of in-house R and D units. An educated and skilled workforce is essential to economic development, and for this a new public policy for a radical transformation of the education system is needed.

I

Technological Scene on Eve of Structural Adjustment

WITH the benefit of hindsight, we can see four major periods in the evolution of industrial and technological policies of the Indian state, each period defined by departures from some of the positions taken in the previous period. The first period, 1950-1965, was marked by the state acquiring and keeping the lead in the producer goods sector, i.e., capital goods and some key intermediate goods, leaving almost the entire consumer goods and the non-strategic parts of the intermediate goods sectors to private Indian and foreign capital. During the second period, 1966-1984, the emphasis on state ownership and control of the strategic parts of Indian industry gradually declined, and the strategy of self-reliantly catching up with the west technologically was abandoned in practice (though not in rhetoric). The third period, which spans the years 1985-1991, signalled the retreat of the state from the 'commanding heights of the economy'. It initiated the entry of the private sector into areas formerly reserved exclusively for the public sector. It also witnessed a strengthening of the strategy of 'import liberalisation for modernisation of industry' which was set in motion already during the latter half of the second period. The onset of the so-called 'stabilisation and structural adjustment programme' in July 1991 heralds the start of the fourth period. (For a detailed presentation of the Indian government's industrial policies over the last 40 years, the reader is referred to Sandesara 1992.)

The conventional division of India's so-called 'mixed economy' into 'public' and 'private' sectors can be misleading. They are two sides of the same coin. It should be borne in mind that from independence (1947) onwards the strategic aim of those who wielded real (as opposed to nominal) power was to make India into a strong nation-state on the foundations of a strong capitalist economy. There was a convergence of views between the state and domestic private capital

as to their respective roles in this endeavour: the state would provide highly subsidised transport, communication and social infrastructure, as well as basic materials and energy (e.g., steel, chemicals, coal and electricity) required by industry (both private and public), impose barriers against imports and create highly protected domestic markets for the output of domestic industry; the private sector would accumulate capital and grow by supplying the domestic market for consumer goods. State intervention on behalf of domestic industry has been and will continue to be the key issue in the process of successfully industrialising any country, let alone India, as the literature on the economic development of Europe, North America and east Asia repeatedly demonstrates. (See the critique of the World Bank's 1993 report on 'The East Asian Miracle' in the special section of *World Development*, April 1994.) The question, then, is not whether the state should intervene, but how and how much. As a background to the analysis in this paper of how structural adjustment is likely to affect industry and technology in India, we will in this section briefly review the technological outcome of the state intervention practised over the last four decades.

During the first policy period (1950-1965), with its three first five-year plans single-mindedly concentrating on building domestic manufacturing capacity in capital goods, India had strong technical collaboration with both the west and the erstwhile communist bloc. But with the onset of the second policy period in the mid-1960s, technology transfer from the communist bloc began to decline in favour of increasing collaboration with western transnational corporations. By the mid-1980s, when the third policy period with its strong bias towards liberalisation had been ushered in, the former Soviet Union and eastern Europe were out of the picture altogether. Already by then, technology agreements with the OECD region were running into several thousands. Since then, the demand for, and the approval of, technology agreements have greatly

accelerated, as is evident if we note that during 1985-1990 the total number of new agreements approved were 5,203, which was 80 per cent more than the 2,916 approved over the preceding five-year period 1980-1984 [India-DSIR 1992]. These figures bear eloquent witness to the fruition of the quiet and implicit policy embarked upon in the early 1970s of abandoning the quest for self-reliant indigenous technological development. Official industrial statistics in India are now graced by a new concept of classification, the 'foreign collaborated firm', as in Wipro-Sun, HPL-HP, PSI-Bull, etc [Vyasulu 1993].

Let us now turn to the question of what actually has been achieved on the basis of this massive import of technology.

ANALYTICAL FRAMEWORK

The concept of modern technology we adopt is a broad one. Its 'embodied' or 'hardware' form consists of tools, machinery, equipment and vehicles, which together make up the category of capital goods. Its 'disembodied' or 'software' form encompasses the knowledge and skills required for the use, maintenance, repair, production, adaptation and innovation of capital goods, which are often also labelled in the literature as 'the know-how and the know-why of processes and products'. In our usage, knowledge and skills refer not only to scientific, engineering and technical abilities, but also to the skills associated with organisation, management and information. Hereafter we use the terms 'knowledge' and 'skills' interchangeably.

We find it analytically useful to classify modern technology into two broad types, standard-modern and highly-modern, on the basis of five indicators: automation, science-relatedness, research-intensity, dominant innovative skills and leading sectors [Freeman 1974]. These two broad types, which we hereafter denote by 'standard-tech' and 'high tech', are characterised respectively by 'medium' and 'high' values in their degrees of automation, science-relatedness and research intensity. For a

detailed exposition of this approach to technology analysis the reader is referred to Bhagavan (1990). The range of professional skills required for the regular use, maintenance, repair and production of the capital goods belonging to these two types of technologies depends of course on the specific industrial and infrastructural branches at which one is looking. In general, they comprise a large number, but not all, of the skill categories listed under the International Standard Classification of Occupations (Appendix 2), excluding those that come under sales, services and agriculture.

A country's capacity to innovate in standard and high techs presupposes the existence of a good base in the skills mentioned above. However, that is not enough. In addition, one has to acquire capacity in certain areas which are specifically innovation-oriented. Research scientists and research engineers represent the class of people with leading innovative skills. For much of the century-long duration of the standard modern era in the west (1860-1960), the research scientist and the research engineer worked individually without being tied to 'systems approaches'. The transition from standard to high tech, both in 'old' products (say, textile machinery) and in entirely new ones (say, digital telecommunication), depends crucially on systems approaches to solving problems. The innovations associated with the high tech area, and with the transition from standard to high tech in already known products, appear impossible without professionalised R and D entities in which research scientists and engineers, as well as system and symbol analysts, work as teams.

Roughly speaking, the transition from the standard-modern to the highly-modern era began in western Europe and north America in the 1960s. Some examples of the leading sectors that exemplify standard-tech capital goods and skills are steel, railways, electricals, automobiles, plastics, synthetic textiles and synthetic dyes. However, all these 'old' products have made the transition and are now available in their high tech avatars. Examples of entirely new leading sectors that have arisen with high tech are microelectronics, computers, digital and satellite-based telecommunications, robotics, informatics, biotechnology (based on genetic engineering) and new materials.

USING AND REPLICATING IMPORTED STANDARD-MODERN TECHNOLOGY

In the following we summarise the factors and measures that helped India acquire, within a space of 30 years (1950-1980), the capacity to use and replicate a great variety of imported standard-modern capital goods, as well as a few highly-modern ones. However, what has signally failed is the

apparent effort to acquire the capacity to design and innovate new standard-tech, let alone the very much more complex high tech. On paper, of course, the Indian state formulated a host of measures to generate this capacity. But no serious efforts were made to systematically enforce these measures and to create the environment that would oblige both the public and private sectors, as well as government-funded R and D establishments, to undertake technology designing and technology innovation.

Table 1 shows that imports of consumer goods had been drastically reduced already by the early 1970s in comparison with the other two sectors. By then India was meeting most of domestic demand for consumer goods by domestic production, importing mainly a small range of consumer durables for its high-income stratum that it was not yet making itself

Machinery dominated the import composition of capital goods, accounting for nearly 90 per cent by 1981. The average annual growth rates of imports of machinery and transport equipment were also very high right to the end of the 1970s, reaching nearly 17 per cent by 1980

Since, by the early 1980s, India had achieved a large capacity in domestic manufacture of capital goods, the question arises as to why imports of capital goods did not decline much from the 1970s level. The answer lies in the fact that although India had achieved near self-sufficiency in replicating standard-tech by the late 1970s, it was very far from doing that in high tech, on which was what the capital goods imports in the 1980s and beyond concentrated. Nearly 30 per cent of the capital goods imports in the early 1980s consisted of high tech such as electrical power machinery and switch gear, telecommunication equipment, computers, aircraft and ships [Bhagavan 1990]. In comparing the monetary values of imports, one should remember that the cost of even one high tech capital good, say, a long-range civilian jet aircraft, may be several orders of magnitudes higher than that of a large number of consumer durables, say, dishwashers.

India began exporting standard-tech capital goods from the late 1970s onwards, accounting by 1984 for 10 per cent of total value of exports [Lall 1990].

SKILL STRUCTURE OF WORKFORCE

One of the key indicators of a country's technological level is the skill composition of its workforce. The historical pattern is that employment in modern industry and infrastructure overtakes that in agriculture, as a country becomes more industrialised. And since substantial parts of industrial and infrastructural work require machine-related skills, a relative increase in industrial and

infrastructural employment can be taken to be a rough and ready indicator of an increase in the skill level of the workforce.

Looking at Table 2 we note that South Korea conforms to this pattern, but not India. Between 1970 and 1989, there was a massive shift downwards in agriculture's share of employment in South Korea by 30 percentage points (category 6), accompanied by a shift upwards in the share of industry and infrastructure by 12 percentage points (categories 7, 8 and 9). In India, there has been no shift at all in industry's and infrastructure's share of employment over the period 1971-1981. It is immobile at 13 per cent, while that in agriculture has decreased by more than six percentage points. That decrease is in effect a corresponding rise in unemployment, as the other sectors have also stayed motionless, as is clear from Table 2. Although the Indian data refer to 1981, the well-documented fact that there has been virtually no growth in employment in the organised registered sector of industry during the 1980s [Ghose 1993] let us infer that industry's and infrastructure's share of total employment in the early 1990s is very likely to be less than it was in the early 1980s. Thus, at a very aggregate level, we can venture the opinion that there has been no structural shift within the Indian workforce in the direction of increasing total machine-related skill content

Professional, technical and managerial personnel are of strategic importance in industrial and technological advance. Here too, India seems not to have undergone the kind of structural change that rapid technological progress requires. The figures for categories 1 and 2 in Table 2 demonstrate that over the 10-year period 1971-1981 these two categories stood structurally still at 3.6 per cent of the total workforce. There is no factor in the Indian economy that indicates that this figure may have moved up in the 1980s. Rather, the opposite is true. The measure of Indian non-performance becomes clear when compared with South Korea's strong shift towards higher skills as revealed by the four percentage point increase in categories 1 and 2 over the period 1970-1989.

SCIENTIFIC AND TECHNOLOGICAL MANPOWER

Under the strategy of relatively rapid industrialisation that India adopted after

TABLE 1: STRUCTURE OF IMPORTS OF MANUFACTURED GOODS: PERCENTAGE DISTRIBUTION OF VALUE OF IMPORTS BY BROAD SECTORS

Year	Capital Goods	Intermediate Goods	Consumer Goods
1970	16.7	73.6	6.8
1981	13.4	77.5	9.1

independence, there arose a sharply increasing demand for large numbers of literate workers skilled in basic industrial skills. The tradition of recruiting unskilled (and most often illiterate) labourers, and training them on the job to acquire the skills that any particular enterprise required, proved wholly inadequate. It was argued that the expanding secondary education system would meet this challenge.

On an average, about 15 per cent of the employees in industry and infrastructure belong to the skilled category. In theory, the supply of recruits into this group should therefore be easily ensurable by Indian secondary schools even at their current very low proportional intakes. One may be tempted to conclude that the supply of recruits for skilled work does not pose a problem in India. However, industrial employers would, in the first instance, be looking for vocationally trained candidates rather than fresh secondary school leavers. Therefore a better measure of the actual recruiting base would be the output of vocational schools that train pupils over several years in one or more industrial skills.

In the early 1980s, India was producing around 4,00,000 vocational school leavers per year, which was roughly 7 per cent of employment in manufacturing. This should be compared with South Korea's 8,40,000, corresponding to 40 per cent of manufacturing jobs [Lall 1990]. As mentioned earlier, the 1980s in India were the years of 'jobless growth'. So in terms of absorptive capacity, even the very modest output by Indian vocational schools (in comparison with South Korea's absolute figures, let alone on a per capita basis) was already too high for Indian industry.

Technicians take a midway position between skilled workers and graduate scientists and engineers. Their role is crucial in industrial development. Ideally, their work should consist of diagnosing and putting right major faults in a range of sophisticated equipment, and liaising among the planning, designing and engineering sections, leaving the actual implementation of the designs to skilled workers. However, in the absence of any significant design work in Indian industry at present, the technical-liaising dimension has remained dormant. Instead, technicians' present primary duties are as foremen and supervisors, exercising technical and social control over factory floor labour. In other words, the talents and training of technicians are being underutilised.

One among several illustrations of the telling contrasts in skill levels and skill use between sluggish and dynamic industrial sectors is provided by the figures for technicians in India and South Korea. From Table 3 one can see that whereas there were more than 50,000 technicians per million of the population in South Korea as early as

1981, there were less than 800 technicians per million of the population in India as late as 1990. But when it comes to the production of graduate scientists and engineers, the Indian figures are roughly at par with South Korea's, at around 3,000 per million of the total population (Table 3). The two countries are also at par in proportional enrolment in higher education and specifically in science and engineering (Tables 4 and 5).

INVERTED EDUCATIONAL PYRAMID

The Indian performance in enrolment in secondary education is very poor, not least when compared to the leaders among the late industrialisers like South Korea. It is seen from Table 4 that by the mid-1980s while South Korea was approaching near universal secondary education, India had not even managed to get halfway to that goal.

In the debate about the role of human resources in development, it is now increasingly acknowledged that without universal primary and secondary education it is not possible to generate the process of self-sustaining development. With universal secondary education, every child approaching adulthood will have internalised the primary knowledge base and the basic techniques of learning, with which she can acquire a whole range of new knowledge and skills. It is not a coincidence that the OECD countries and the dynamic east Asian economies (of which South Korea is used here as a reference example to compare and contrast with India) first concentrated on attaining universal secondary education, before making higher education more widely accessible. In terms of financial resources, India has done the opposite: It has poured more public money into higher education on a proportional basis than into primary and secondary education. It shares this feature of the "inverted educational pyramid" with many other developing countries [Upendranath 1993a]. But now with the SAP there are firm indications that this lopsided behaviour will be put right and primary and secondary education will begin to get more of the education budget.

The imperatives that lie behind this skewed policy of promoting higher education while grossly neglecting primary and secondary education are those of the politically powerful middle class [Upendranath 1993a]. It wants higher education for its offspring partly for reasons of social status and partly because it is the minimum qualification required for any white collar job. But the contradiction of supplying degrees in excess of the needs of a sluggish economy has been transparent for a long time in the guise of graduate unemployment. It is reported that about 1.2 million science and engineering graduates and technicians were registered as unemployed in 1990.

The difference between quantity and quality is nowhere more apparent than in the realms of the work done by scientists, engineers and technicians. For instance, although India is reputed to have the world's third largest combined stock of these three professions, its industrial productivity has still recently been negative and the quality of its industrial products open to serious misgiving. These negative outcomes have their origins in the following conditions under which higher education has been, and continues to be, conducted. First, and perhaps the most devastating, is that non-academic, non-merit factors are decisive in gaining entry into professional courses. Second is the predominantly book-bound orientation of the training, with rote-learning and exams-passing almost totally displacing problem-solving approaches. Third, out of the countless number of universities and colleges, only a tiny fraction has the resources to provide basic laboratories and workshops to back up theoretical work – for the others with no experimental facilities, science simply becomes theology. Fourth, with higher education having exploded in numbers beyond imagination, there simply are not enough places in industries and other professional sectors to place undergraduates for short periods of practical training. On top of all this, there is the annual brain drain of promising young talent to technologically greener pastures elsewhere. To quote from the *Far Eastern Economic Review* (1992): "Out of the 190 recognised universities, the world-class science and engineering institutions number only about a dozen. These schools turn out 2,000-3,000 graduates a year. About a third opt for management careers or the civil service. Another third emigrate to the US, Canada and Singapore."

II

Indian R and D: Not Technology Innovation, but Technology Absorption

The explicit involvement of the government of India in funding targeted scientific and industrial research predates independence in 1947. In 1942, following the British model, the then colonial government in New Delhi established a Council of Scientific and Industrial Research (CSIR) to oversee and be in charge of a few national laboratories, created at that time to investigate whether imported industrial raw materials could be replaced by local ones to overcome the problems created by the ongoing second world war. Recognising the central importance of technology to economic development, the government of independent India rapidly expanded the number of national research laboratories and institutes

under the CSIR umbrella to over 40 by the late 1960s. They were spread over major cities in the country and covered a wide field in the natural and engineering sciences. Their mandate was to do both 'pure' and 'applied' research, and in particular to address the technological problems of industry and contribute to technological innovation. Since then, the exercise has been repeated in other fields like agriculture, forestry, marine resources, medicine, electronics and biotechnology, with each new area being placed under a separate ministerial department that funds and controls the corresponding national laboratories and institutes.

GOVERNMENT RESEARCH LABORATORIES

Total R and D funding in India grew very rapidly during the 1980s, increasing by nearly a factor of six over the period 1981-1991, from slightly over Rs 7 billion in 1981 to Rs 42 billion in 1991 (US \$ 2.3 billion at the then exchange rate). Eighty per cent of the 1991 funding was spent in government labs and public sector enterprises, with the private sector accounting for the remaining 20 per cent [India-DST 1992]. Over half of the government funding, Rs 18 billion, went to three organisations, the Defence Research and Development Organisation (with its huge number of R and D units), the department of atomic energy and the department of space research.

In order to ensure that top class engineers would be available for leading industrial development work, the Indian government, with generous financial and technical assistance from the west, created five Indian Institutes of Technology (IITs). Like the national labs, they too were geographically spread out, with two in the north and one each in east, south and west. Besides providing undergraduate and postgraduate education in the engineering sciences, they were charged with the responsibility of being in the forefront of technological research.

The third approach to promoting technological research was much more diffuse. It was to try and coax both public and private sector industries into establishing in-house R and D units with import tax rebates and generous amortisation rates for R and D equipment.

The scientific establishment in India routinely bemoans the fact that India spends less than its role models in east Asia on R and D as a proportion of its total GDP. For instance, in 1990, Japan, South Korea, Taiwan and India spent, respectively, US \$ 85.6 billion (2.98 per cent of GDP), 3.2 billion (1.83 per cent), 2 billion (1.41 per cent) and 0.88 billion (0.88 per cent) on R and D. What they conveniently forget to mention is that the overwhelming part of east Asian funding comes from the domestic private sector, which really makes sure that it gets value for its money [Sigurdson 1990].

A corollary of this is the stunning performance of the east Asians in making technical changes, in generating technological innovations and putting new products and processes on the market. Considering the truly colossal sums spent on civilian R and D by the government over the last four decades, India has little to show in terms of civilian innovation that is its own. From toothbrushes to tractors, from shoe polish to ships, from bicycles to buses, any improvements that the Indian customer may have enjoyed are still the result of continuing import of technology. The Indian customer is also unaware of any incremental technical improvement in commodities of regular use that government-funded R and D may have hit upon. Not that private sector R and D has done any better.

Whatever else they may have accomplished, it is now clear that the government research labs and institutes have been less than marginal in promoting technical change and innovation in Indian industry and infrastructure. The labs charge industry with deliberately ignoring their contributions in preference to imported technology. Industry claims that the labs have concentrated on work which is of no relevance to industry. The accusations fly back and forth. What the verdict of the present Indian government is can be inferred from the fact that it imparted a sharp shock to the government research labs and institutes in 1992 by not approving the expected automatic annual increase in their budget allocation, hinting that the future would be pretty dire. The ministry of finance has told them to generate 30 per cent of their budget from commissioned work from the private sector. At the time of writing, several of them have set up marketing units and task forces to try and sell their know-how to private industry.

A recent empirical study into industrial R and D in India [Alam 1993] finds that "a large number of firms were unhappy with

their experiences with these [government] laboratories and institutes. Most felt that the facilities available with these institutes were adequate, but that their approach to research for industry was not very positive. The most common feeling was that the national laboratories and research institutes were not used to commercial culture and did not appreciate the importance of completing jobs on time. This has led to frustration and losses for the firms. Firms also felt that the facilities available with these laboratories are grossly underutilised and could be used by industry for testing prototypes, etc".

The IITs seem to have fared somewhat better than the CSIR labs in responding to industry's needs. To quote from the same report [Alam 1993]: "Our case studies reveal that ... industry sponsored research projects (at the IITs) aimed at solving specific problems". Be that as it may, of the original two-part intention that the IITs should not only produce the very best engineering graduates but also retain the intellectually brightest of them to do technological R and D within the country, only the first appears to have been seriously tried. Apparently about a thousand IIT graduates leave India each year for North America.

IN-HOUSE R AND D IN INDUSTRIAL FIRMS

That brings us to a consideration of in-house R and D in industry. A look at the macro-statistics gathered and annually published by the Indian government tells us that the number of industrial firms with some kind of in-house R and D has been steadily increasing over the last two decades and is now nearing the figure 1200. It also tells us that the total amount spent by them on R and D as a proportion of their total sales is about 0.66 per cent, averaged over the six-year period 1985-1990 [India-DST 1992]. Considerable amounts of case study material and analyses, at both the micro and macro

TABLE 2. PERCENTAGE DISTRIBUTION OF WORKFORCE BY BROAD SKILL CATEGORIES

Country/Year	ISCO Major Groups (see notes below) Percentages					
	1	2	3	4	5	6
India 1971	2.7	0.9	2.8	4.0	3.3	72.5
1981	2.7	0.9	2.8	3.9	2.6	66.1
S Korea 1970	3.1	0.9	5.8	9.9	6.5	49.6
1989	6.7	1.4	12.1	14.3	10.5	18.8

- Notes: 1 The above percentages do not always add up to 100, because we have excluded from the table the categories 'workers not classifiable by occupation' and 'unemployed'.
2 For India, 1981 is the latest year for which published data were available in United Nations sources at the time of writing.
3 By 'workforce' we mean those categorised as 'economically active population' by the UN Statistical Office.
4 1 = Professional, technical and related workers
5 = Administrative and managerial workers
6 = Clerical and related workers
7 = Sales workers
8 = Service workers
9 = Agriculture, animal husbandry and related workers
10 = Production and related workers, transport equipment and labourers

SAGE PUBLICATIONS

SENIOR MANAGEMENT—THE DYNAMICS OF EFFECTIVENESS

SUSHILA SINGHAL

Among the unique features of this book are its integration of quantitative and qualitative data and the interface it provides between social reality, management theory and corporate policy.

HRD Newsletter

1994 ■ 216 pages ■ Rs 240 (cloth) ■ Rs 135 (paper)

WORK MOTIVATION

Models for Developing Countries
edited by **RABINDRA N KANUNGO**
and **MANUEL MENDONCA**

A collection of articles written by reputed management teachers... This book gives a good account of the various theories and models on work motivation.

Business India

The central purpose of this stimulating collection of original essays is to understand why the potential of work motivation techniques has not been fully realized in developing countries.

OBS for Social Development

1994 ■ 290 pages ■ Rs 275 (cloth) ■ Rs 150 (paper)

ORGANISING RURAL BUSINESS

Policy, Planning and Management
RAJAGOPAL

This book provides insights and methods for the design of alternative marketing channels which can ensure that the optimum economic benefits flow to rural entrepreneurs. Dr Rajagopal enunciates a management approach to the marketing of rural products which has so far been an unorganised activity. He covers a wide range of important and pragmatic issues and describes all essential aspects for managing product marketing in a rural perspective

1995 ■ 188 pages ■ Rs 245 (cloth) ■ Rs 135 (paper)

JOURNAL OF HUMAN VALUES

Editor: **S K CHAKRABORTY**

The **Journal of Human Values** provides an international forum for the exchange of ideas, principles and processes concerning the application of human values to organizations and institutions, and to the world at large. The journal carries critical essays, theoretical explorations and empirical studies. It welcomes articles from a wide cross-section: scholars, bureaucrats, artists, scientists and practising managers.

Frequency: Biannual ■ Annual Subscription: Rs 300
(Institutional) ■ Rs 150 (Individual)

ORGANIZATIONAL ETHNOGRAPHY

An Illustrative Application in
the Study of Indian R&D Settings

V SUCHITRA MOULY

and **JAYARAM K SANKARAN**

There is increasing scepticism about the ability of conventional, quantitative techniques to fully comprehend organizational realities. At the same time, there is a serious lacuna in existing research on Indian R&D since there is a distinct lack of in-depth, qualitative studies. This book addresses these two related issues. On the one hand it seeks to introduce the relatively new qualitative paradigm of organizational ethnography as a viable mode of inquiry into organizations, while on the other it demonstrates the potential of ethnography to provide penetrating insights concerning R&D organizations.

1995 ■ 180 pages ■ Rs 235 (cloth)

MANAGERIAL TRANSFORMATION BY VALUES

A Corporate Pilgrimage
S K CHAKRABORTY

This is not only an original, but also a relevant and useful addition to the growing literature on the Indian approach to industrial management... The author is one of India's leading management thinkers.

Indian Review of Books

Hopefully, Chakraborty's book will enthuse other Indian companies to choose such abiding methods for total quality improvement.

Business Today

1993 ■ 215 pages ■ Rs 200 (cloth) ■ Rs 100 (paper)

JOURNAL OF ENTREPRENEURSHIP

Editor: **DWIJENDRA TRIPATHI**

The **Journal of Entrepreneurship** provides a competent vehicle to disseminate the results of research in the field and to document innovative experiments directed towards developing entrepreneurship. The principal purpose of the journal is to provide an avenue for the publication of original contributions, both conceptual and empirical, and to serve as a vehicle for the fast growing literature on the theory and practice of entrepreneurship.

Frequency: Biannual ■ Annual Subscription Rs 250
(Institutional) ■ Rs 145 (Individual)

levels, are now available on why Indian industrial firms, both public and private, invest in R and D and what fruit that investment has borne. We summarise below the main findings of a number of these studies [Alam 1993; Desai 1988, 1990; Gumaste 1988; Kathuria 1989; Katrak 1989; Kumar 1987; Lall 1987; Tyabji 1993], which also investigate the effect of government policy on promoting R and D at the firm level.

Empirical studies of several hundred firms were conducted by some of the above-mentioned authors. They covered the fields of ceramics, electronics, electricals, machinery, automobiles, metallurgy, metal working, chemical engineering, minerals and mining, paper, textiles, leather and food processing. The firms identified the following activities as the principal objectives of their R and D work: product adaptation, product diversification, indigenisation of components, indigenisation of raw materials and testing. Of these, the first three were mentioned the most often. Some firms also claimed that they did some 'product development'. On a closer look, what this claim boiled down to is minor modifications of imported articles, or their imitation or an expansion of the product line by introducing new imports.

One of the measures that the government insisted on being implemented within foreign technology agreements was the rapid replacement of imported part-components by locally manufactured ones. This process of 'indigenisation' of component manufacture, as it has come to be called, also required rapid absorption of increasing volumes of foreign technology. The R and D units became the principal vehicles for indigenisation. On analysing their data, the authors find that the primary objective of firms in setting up R and D units was to develop in-house skills to understand how the imported capital goods function (know-how), why they do what they do (know-why), what their strengths and weaknesses are, and what the critical points are of which one has to be aware. This process is called 'technology absorption'.

It is very important to note that technological innovation, which among other things involves acquisition of design capacity, does not feature among the R and D goals of the firms studied. Product adaptation, which usually involves some incremental technical change, is the first step towards product innovation. With most of the attention being focused on absorbing the know-how, the learning of know-why receded into the background. Without know-why it is not possible to successfully attempt change and adaptation in imported technology to suit local conditions. Nor was such change the first priority of most firm owners. Improvement in product quality, production efficiency and labour productivity were of much more central concern; these could be tackled on the basis of the know-how that came with the imported technology.

Firms in electronics and electricals spend more on R and D as a percentage of sales than other firms, with metal industries spending least, while machinery and chemicals take intermediate positions. Roughly the same pattern holds for royalty and other payments for dis-embodied technology (i.e., technological knowledge) as a proportion of sales. A plausible hypothesis that would explain both these patterns is that the rate of technical change in electronics and electricals is much higher than in other areas, leading to frequent imports of new technology, which in turn necessitates a continuous strengthening of the firm's technology absorption capability.

A sharp increase has been noted in the total volume of payments made for foreign technical knowledge (disembodied technology). But, at the same time the case studies find, somewhat to their surprise, that the more generous terms allowed for payments for technological knowledge since 1985 and 1991 have not led to any significant increases in the import of technological knowledge by individual firms as individual firms. The increase in the total volume of payments would then mean that substantial numbers of new firms have entered the market as knowledge buyers. A prime reason why the costs of individual agreements have not risen to the degree expected is that firms are buying only very specific bits of hardware and software, and not a whole composite machinery. This ability to 'unpackage' technology and buy only that which cannot be locally generated is a promising sign of the growing industrial maturity of the country.

It seems as though the limiting factor on R and D investment was not the terms set by the government but quite simply the level of the financial resources available to firms. In fact, most case studies underline the fact that on an average an Indian firm spends far too little on knowledge import and in-house R and D to really be able to attempt technological innovation. The firms are fully aware of this limitation. Their purpose in establishing in-house R and D is first and foremost to absorb technology. One of India's leading industrialists is quoted as saying that "none of this [i.e., in-house R and D] is research. It's mostly reverse engineering. Basic research would mean a lot of time reinventing the wheel, and the funds required are such that most Indian companies can't compete - Honda's R and D expenditure is more than my annual turnover" [*Far Eastern Economic Review* 1992].

Firms point out that a technology agreement makes it easier to source the capital goods and production inputs through the foreign partner's knowledge of, and contacts in, the supplying market. Indian firms usually do not have the resources to build-up such information and market capabilities. In other words, technology agreements are often even less significant

than they are made out to be - they are less the vehicles for upgrading technological knowledge than a practical and relatively inexpensive way of sourcing capital goods and inputs. An extreme is reached when, as in some leather and textile firms, the foreign collaboration agreement is nothing more than a means of obtaining market intelligence.

Analyses of macro-policy factors that promoted or inhibited R and D activities at firm level revealed the following trends. The smallness of the size of most Indian firms in comparison with those in the OECD region is an inhibiting factor when it comes to significant investments in R and D. In contrast to that, firms' export capacity and market competitiveness had no significant impact in either direction. The more liberal rules introduced in 1985 and 1991 for foreign equity holdings in Indian firms, as well as for import of technology, seem to have started eroding the earlier rationale for investing in R and D. However, it was also noted that firms which increased their import of technology and production inputs also invested more in R and D to generate the appropriate kinds and levels of technology absorption capacity.

III

Imposition of Stabilisation and Structural Adjustment Programme

1991 CRISIS AS PRELUDE TO SSAP

The liberalisation of imports and foreign exchange transactions, sanctioned by the 1985 policies, ate rapidly into India's foreign exchange reserves. The sudden increase in the import bill of oil caused by the Gulf war, though brief, was another severe drain. In the aftermath of the Gulf war, forex remittances from Indian workers from the Gulf states dried up. With the confidence in the Indian economy declining, Indians resident abroad began withdrawing their forex deposits from Indian banks. By the summer of 1991 the forex reserves were down to a level insufficient even to cover essential imports for a few weeks!

The total external debt had meanwhile climbed to 70 billion US dollars, corresponding to nearly a quarter of the total GDP, giving India the dubious distinction of being the third largest debtor nation in the third world after Brazil and Mexico. With the forex reserves at rock bottom, India found itself for the first time in the position of having to default on its debt servicing which had now climbed to 22 per cent of export income, a move that would have choked off all future avenues for foreign loan and credit facilities. Five years after the optimistic projections made by the Indian government in 1985 while launching its liberalisation policies, its fiscal crisis had not got any better, but worse. A measure of that crisis is the fact that the accumulated domestic borrowing of the Indian government (financed largely out

of the savings of middle class households held in banks, bonds and sundry financial institutions and instruments) had reached a staggering 55 per cent of the GDP by 1991. In the same year, consumer price inflation had risen to 14 per cent from the 8 per cent in 1985.

The balance of payments crisis and the fiscal crisis of the state are deeply structural and cannot be resolved by short-term measures. But a quick short-term 'fix' had to be found to stave off impending disaster, and it came in the shape of yet another massive loan from the International Monetary Fund. But that loan was conditional on the Indian government's commitment to implementing the IMF's standard prescription of stabilisation and structural adjustment (SSAP). This is not the place to recount the details of the measures proposed within the SSAP for various sectors of the Indian economy and society. For a meticulous, if somewhat positivist, summary that captures the essentials, the reader is referred to Das (1993).

The thrust of the stabilisation policies is to devalue the currency to make exports cheaper and imports dearer, to check inflation through a squeeze on money supply, credits, wages and incomes, and to stimulate investment and demand through tax reductions. The principal long-term aims of the structural adjustment programme (SAP) are to reshape the economy along 'free market' lines which would drastically curtail the role of the state in the ownership and control of economic assets and activities, give the private sector (both domestic and foreign) the dominant role in all sectors of the economy, promote unimpeded imports of foreign goods, services, investment and technology, provide special incentives to promote exports, end all subsidies and sharply reduce state financing of social services such as education, health and transport.

A vigorous debate is taking place among Indian academics, policy-makers and government officials on the pros and cons of the SAP. A great deal has been written and published. To obtain a quick overview of the positions taken, the reader is referred to ILO-ARTEP (1992), Raghuram (1991), Gupta (1993) and Nayyar (1993).

To sum up, then, 'liberalisation' and the SAP were not bolts from the blue. Between the 'closing' of the economy in the early 1950s and its near total 'opening' in the early 1990s, one can discern a gradual political-economic process, the turn towards the 'opening' already being taken by the mid-1970s. The fiscal crisis of the state and the balance of payments crisis, which came to a head in 1991, are but the latest episodes in a long drawn out struggle between the main contenders for economic and political power [Bardhan 1984; Patnaik 1986; Kurien 1986; Bhagavan 1987].

NEW INDUSTRIAL AND TECHNOLOGICAL POLICIES UNDER SAP

The new industrial policy introduced by the Indian government as part of the SAP extends and completes the liberalisation measures of 1985. We summarise its main features and the associated technological measures below.

(a) The licensing system has been abolished for all branches of mining and manufacturing industry except those involving strategic and security concerns, social and environmental concerns, hazardous chemicals and elite consumer durables. These exceptions comprise the following: defence, aerospace, explosives and fossil fuels; alcohol, tobacco and asbestos; sugar, animal fats and oils; leather, furs and skins; chemically treated wood products, paper and newsprint; pharmaceuticals; motor cars, entertainment electronics and household white goods (refrigerators, washing machines, air-conditioners, etc). The small-scale sector would, however, be automatically exempt from licensing for any of the above 18 branches which fall within the list of commodities already exclusively reserved for it through earlier policies. The upper limit on investment in plant and machinery has been raised from Rs 3.5 million to Rs 6 million for small-scale units in general, and to 7 million for so-called ancillary units of bigger firms and for export-oriented small-scale firms. Other firms can now hold up to a quarter of the total investment in any small-scale unit. No licensing is required for expansion of existing production capacities, or for adding new product lines within the existing commodity area of the firm (so-called broad-banding).

(b) Permission to import capital goods would be automatic for projects which ensure foreign exchange through foreign investment, provided their CIF value is less than 25 per cent of the total value of the plant and equipment, subject to a ceiling of Rs 20 million.

(c) A virtual 'open door' policy for foreign investment, with an upper limit of 51 per cent of the equity in any given firm, comes into effect in 34 so-called 'high priority industries', which covers a great many major branches in capital, intermediate and consumer goods sectors, as well as in tourism (see Appendix). To qualify for such automatic clearance, the foreign exchange cost of the imported capital goods must be covered by the foreign equity.

(d) Technology agreements with foreign

suppliers would be automatically approved for the above-mentioned 34 high priority industries, subject to upper limits of Rs 10 million for lump sum payments and 8 per cent of sales for royalty payments. These payments, for which foreign exchange would be automatically approved, would last for a maximum of 10 years from the date of agreement, or seven years after the commencement of production. Non-priority industries would also enjoy this privilege of automatic approval provided they did not claim the same 'free' access to foreign exchange technology payments to which the priority industries have a right.

(e) No permission would be required for hiring foreign technical personnel.

(f) The eight industries hitherto reserved exclusively for the public sector would now be open to the private sector. They are defence; atomic energy and associated fuels and materials' fossil fuels; the mining of ferrous and non-ferrous ores, as well as some strategic and precious metals; and railway transport.

(g) Public sector firms would be subjected to critical review, which would not exclude the possibilities of closure, liquidation, rehabilitation or privatisation. The criteria that would guide any action in these directions would be related to inefficiency in performance, low levels in technology, smallness of scale, low social priority, and not least the existence of well-developed private sector capacities supplying the same commodities. The government has announced its intention to sell 20 per cent of its holdings in the public sector, while simultaneously directing public sector firms to generate more internal resources. Public sector firms would from now on be held to agreed levels of performance through binding memoranda of understanding. Their boards would be made more professional and autonomous and given greater power.

(h) The central provisions of the Monopolies and Restrictive Trade Practices (MRTP) Act have been scrapped. Mergers and takeovers are now freely permitted. Prior government approval for expanding present undertakings or for starting new ones is no longer necessary.

(i) Both imports and exports have been greatly liberalised. Only very few commodities are banned outright from import and export, while between 60 and 70 are placed on the restricted list for exports and imports respectively. Capital goods are being

particularly favoured both with easier import rules for a great majority of items and enhance incentives for their exports.

The above policies have been launched with the conviction that they will lead to rapid rates of industrial growth and exports, through first, high inflows of foreign investment and technology; second, higher investment by the domestic private sector, third, increased efficiency in both the public and private sectors; and fourth, increased competitiveness in domestic and foreign markets both in terms of price and quality.

IV

Industrial Restructuring in Wake of Structural Adjustment

As we have indicated in earlier sections of this paper, the process of liberalising and opening up the Indian economy was a gradual one which picked up speed in the second half of the 1980s. Under the influence of this process, Indian industry and infrastructure began to undergo a shift and a restructuring in the 1980s relative to the character they had acquired by the late 1970s. The structural adjustment policies introduced in 1991 are likely to intensify and accelerate the trends set in motion in the 1980s. Of the various elements that make up the new industrial policy package of the Indian government, the following can be expected to have the greatest impact.

(a) Abolition of the licensing system, in conjunction with the abolition of the restrictions on growth in investment size, production capacity and product lines of individual enterprises

(b) Automatic approval of majority equity holdings by foreign capital, and of foreign technology collaboration agreements, in the 34 high priority areas listed in the Appendix.

(c) Unrestricted imports of capital goods, technical knowledge and managerial expertise, in a large number of industrial and infrastructural branches, on the condition that these are paid for in convertible hard foreign exchange brought in through foreign investment by the enterprise in question.

(d) Allowing up to one-quarter of the investment capital of a small firm to be owned by other firms.

(e) Enforcing penalties on the public sector for non-performance.

We now examine the differential impact that the new policies are likely to have on the restructuring process that had been set in motion before 1991.

OLIGOPOLY

From the mid-80s onwards, the consumer goods sector, both non-durables and durables, has shown much more dynamism than the intermediate and capital goods sectors. At present it also leads the other two in terms of the share of total industrial output and profits. This performance is traceable to the

macro-economic policy shift of the Indian state in the mid-80s to stimulate consumer demand by the urban and rural middle income groups. With restrictions on investment size, production capacity and product lines gone, the fight between the big industrial-cum-trading houses will greatly intensify to grab as much of the consumer goods cake as possible. The scene is set for the further spreading of the cancer of oligopoly that has affected the Indian body industrial and economic so long, with its ills of market rigging, price fixing, indifference to quality and predilection for kickbacks.

The impressive growth of the small-scale sector over the last four decades has taken place under the protection offered by two policies: first, the reservation of certain commodities for the small scale sector from which the large firms were excluded; second, severe restrictions on how much of a small firm's capital can be owned by other firms. While 'commodity reservation' is still in place in the new industrial policy, the capital ownership restriction has been substantially weakened. One can foresee how through the '25 per cent rule' mentioned above, large companies will increase the scope and magnitude of their control, *de facto* if not *de jure*, of the more dynamic and profitable small firms, something that has been conducted so far on a modest scale by undercover proxy ownership. This in turn will indirectly further erode the protection offered by commodity reservation. The small firms that come under the grip of large ones will perforce follow the economic rationale of the latter in replacing labour-intensive technology by labour-displacing ones, and local resources by non-local ones.

These moves will further entrench and accelerate the decades old process of concentration of the more profitable goods in the hands of a limited number of large firms, with the small scale sector left to produce for the poor majority. The brunt of this scale-encroachment will be borne mainly by the following historically most dynamic branches of the small scale sector, which today account for between 40 and 90 per cent of the branchwise value added (see Table 4.2 in Sandesara 1992): food processing, beverages, tobacco, textiles, wood and leather products, and simpler metal products and parts, including household utensils.

PRODUCTION FOR DOMESTIC MARKET VS FOREIGN MARKET

Among the 34 so-called 'high priority' areas that the Indian government has opened up for majority equity ownership by foreign capital, there is not a single consumer goods branch. This is not a coincidence. It is entirely consistent with the post-independence industrialisation strategy of the Indian state to safeguard the consumer goods sector for domestic private capital. On the other hand, the success of the new industrial and

economic policy package is entirely predicated on being able to attract hard currency investment and high tech from the OECD and east Asian regions, to improve the competitiveness of Indian industrial goods, in particular of consumer durables, on the world market. It is hoped that foreign investors will be prepared to accept a non-controlling role in Indian firms in return for attractive profits in export markets. However, it is no secret that the OECD and east Asian investors are primarily interested in getting into the growing middle and upper income markets within India. They are less motivated about helping Indian firms improve their export competitiveness. The interplay of these diverse interests is likely to lead to a major restructuring of the large scale sector in Indian industry along the following lines. It applies to both the private and public sectors, in all the three use-based sectors (those illustrative examples mentioned below which belong to the intermediate and capital goods sectors are taken from the Indian government's priority list reproduced in the Appendix)

(1) Firms which are mainly geared to the domestic market, with no foreign investment but using imported earlier standard-tech designs

Examples: Textiles, beverages, radios, television sets, refrigerators, watches, pharmaceuticals, chemicals, fertilisers, paper and pulp, rubber, cement, building materials, machine tools, industrial and agricultural machinery, passenger and commercial vehicles, railway equipment.

(2) Firms with foreign investment and imported high tech producing largely for the domestic market, but also attempting to export a part of their output

Examples: Colour television, videos, compact discs, washing machines, household gadgets, passenger vehicles, pharma-

ceuticals, chemicals, pre-fabricated building materials; electrical, electronic and telecommunication equipment.

(3) Primarily export-oriented companies with foreign investment and imported high tech.

Examples: A range of the latest micro-processor based consumer durables and household gadgets, chemicals, computers, computerised equipment in electricals and electronics.

RETRENCHING OF PUBLIC SECTOR

Until the mid-1980s, the public sector had been assured a privileged and pampered place in the industrial and technological advance of India. That era is coming to a close. The new policy directive is to hold public sector firms firmly accountable for their future non-performance, entailing the real possibility of cutbacks and closures. In addition, there is the stated policy intention of privatising 20 per cent of the government holdings in the public sector firms. In the not too distant future this may mean that the public sector will have to vacate its place in a range of industries and technologies. Into which of these gaps the private sector, both domestic and foreign, will step depends on their perceived profitability. Clearly, many will not be. This heralds a radical reordering of the industrial scene in India, the contours of which are not yet discernible. The old self-imposed imperative of wanting to make nearly everything from mirrors to missiles has lost its relevance.

V

Technological Implications of Structural Adjustment

In the first section of this paper we reviewed the main features of the technological scene in India on the eve of structural adjustment. We noticed there that the characteristics attained during the 'closed economy and strong state intervention era' had begun to alter under the pressure of liberalising and opening up of the economy in the 1980s. Chief among the features in the late 1980s were lack of dynamism in technology absorption, absence of technological innovation and design capacity, spread of technological dualism, lack of significant structural change in the skill composition of the workforce, poor educational base, etc. We argue below that the new policy regime introduced by SAP is likely to entrench these negative features rather than help to overcome them. The increasing dualism and polarisation in the area of technology and skills is one of the outcomes of the conflict between rival interests: domestic capital vs foreign capital, the Indian state vs the Bretton Woods institutions, production for the domestic market vs the export market, the public sector vs the private sector, the 'sick'

public sector vs the 'healthy' public sector, the large scale vs the small scale, etc. One among several major consequences of these processes will be that medium and large scale firms will speed up their retooling with imported high tech, abandoning domestically produced standard-tech as fast as they can afford. In contrast, the small-scale sector will continue to depend on locally produced technology, becoming by stages its principal customer.

ACQUISITION OF NEW SKILLS

As indicated earlier in our analytical framework, high tech is characterised by high values in the degree of automation, science-relatedness and research-intensity. The high values of these three features are now built into most industrial and infrastructural branches of the OECD countries, and present OECD research is geared to making them ever higher. Any contemporary technology from the OECD that India acquires with foreign equity will be of this kind, irrespective of whether the product or the process is 'classical' or not, e.g. metallurgy, industrial machinery, vehicles, cement, wood, glass, rubber, paper, printing, food processing, beverages, seeds, etc (see the Indian government's list of 'the privileged 34' in the Appendix). One immediate consequence will be that Indian firms will have to retrain their engineers and technicians to use, maintain and repair the new technology. Various branches of high tech share a common base in certain new generic fields of knowledge in science and engineering. There is therefore good grounds for thinking that a substantial part of the retraining should be common to most firms, while the more narrowly specialised activity-specific skills could be imparted inside the firm. Since top quality and hands-on practicality are of the essence in such retraining, there are but a few institutions in India who can be entrusted with this task.

A number of questions have to be addressed urgently: who should mount common retraining courses, how should the costs be shared, where should the courses be located, is there any credible national expertise available to impart the training or is one obliged to rely heavily on expatriate expertise, etc. The private and the public sector should jointly create an independent-minded task force, with no vested interests, to consider the questions and draft a strategy for retraining on a national basis.

Usually, the introduction of high tech renders most semi-skilled, and some skilled work, redundant. (The limited number of skilled workers who will be retained by firms in the transition to high tech will have to undergo retraining of the kind offered to technicians.) Since, under the present relatively just Indian labour laws, workers cannot in effect be retrenched, the private

and the public sector will have to find other areas of work for them. This will be a huge challenge and a growing one. There are as yet no signs that any constructive, humane and productive strategy has been crafted to deal with this challenge. It would be a tremendous waste of the existing technological capacity of India if the technical capabilities of 'potentially redundant' workers are not used productively. Theoretically, there are three ways in which their capacities can be so used.

First, if one has confidence in the official prognosis that SAP will usher in an era of very high growth rates, the new industrial enterprises, both large and small, may be expected to absorb some of the retrenched workforce. But one cannot be sanguine about it. The 1980s relatively high annual rates of industrial growth of 8 per cent occurred with almost no growth in jobs in the registered organised industrial sector. Growth in output was achieved through higher-labour and technological productivities. The high tech transition will in all likelihood attempt to continue this trend of high output growth with low job growth; that is in fact what it will have to do, if all that is asked of it in terms of high productivity, efficiency, quality and market competitiveness has to be delivered. So this route is likely to remain closed for the redundant workforce.

From the recent computations of Ghose (1993) one can infer that labour productivity in manufacturing during the second half of the 1980s maintained the increased positive levels it had attained in the first half. This trend seems less due to increasing skill content of the workforce than to increasing capital intensity of the means of production, retrenchment of labour and the phenomenon of jobless growth. Further, as we have argued elsewhere [Bhagavan 1992], productivity is not merely a function of shop floor efficiency, but also of crucial externalities such as transport and energy infrastructure. It is not a coincidence that the boost in investment in railways, electric power generation and fossil fuel production preceded the 1980s increases in both industrial output and productivity.

The second route is through small scale industry. It is traditionally more labour-intensive than large industry. It would be ideally suited to the levels of skill that the workers have. But to absorb labour at the rate required, it will have to grow at a much greater pace than it is now doing. The wind is apparently blowing in the opposite direction. Potential small scale investors are fighting shy of getting in, saying that the competition is fierce and market demand is stagnant.

The third route is a return to Keynes, with massive public investment in modern energy, transport and communication infrastructure, public civil engineering projects and social

services. This will create massive numbers of new jobs, while at the same time conserving, upgrading and increasing the technological capabilities of the workforce.

In the present age of SAP-hegemony the third route may sound like science fiction, given the fierce hostility of the begetters of SAP – the IMF and the World Bank – to anything that smells remotely Keynesian. But they may be forced to temper their market fundamentalism under the pressure of the new employment-creating forces gathering pace in western Europe. At the European Union (EU) summit meeting held in Corfu, Greece, in June 1994, the heads of the EU governments endorsed the neo-Keynesian proposals contained in the white paper of Jacques Delors, president of the European Commission, to create massive numbers of new jobs based on new skills. This is to be accomplished mainly through the Trans-European Networks (TENS) Programme comprising 11 transport and communication projects. To quote from the *Guardian* (June 1994), ‘the summit agreed to step up governments’ role in stimulating ‘the unprecedented technological revolution’ which can lead to developments in teleworking, distance learning, road and air traffic management, health care networks and electronic tendering’. The Delors proposals are the product of the new economic thinking that has emerged in western Europe over the last few years to grapple with the task of recovering from the disaster of the Reagan-Thatcher era of ‘new liberalism’ [Lane 1993; Keegan 1993; Lipietz 1993].

Since technological dualism will continue to deepen in India, the question arises as to how to cater to the technological upgrading of the small scale sector, which as we have seen above, will be even more crucial in the SAP-era than it was before SAP. The market, as one knows too well by now, will not do it unassisted. In fact, the small scale sector in India owes its existence and growth to state protection. Because of its tremendous heterogeneity and extremely wide geographical dispersal, national technology suppliers cannot individually effectively inform and service this sector.

This prompts the suggestion that the state actively promotes the idea of small industrialists’ associations themselves establishing technology estates in all medium-sized towns to provide technological information to the local small investors in the local language. The information should be backed up by regular demonstrations of nationally produced hardware and software. As these estates find their feet, they will also take on the role of channels of communication between the users and the domestic producers of technology, which, it is to be hoped, will bring about user-driven improvements, incremental or otherwise.

TECHNOLOGY ABSORPTION

About 1,200 industrial firms in India have in-house R and D units. The most qualified work they do is technology absorption; technology design and innovation are at present beyond their capabilities and resources. In the transition to imported high tech, these R and D units are already confronting, and will continue to confront, the challenge of re-skilling themselves to absorb the new technology. The kind of re-skilling called for often involves a shift in their technological paradigm. It will demand of them that they not only theoretically understand the new concepts and the new way of reasoning, but also translate that understanding into shop-floor practice.

The present in-house R and D units, which have evolved slowly to deal with the pre-high tech situation, cannot be ‘re-jigged’ overnight to take on the new challenge. There is little doubt that their capacity to absorb technology will go through a longish period of serious decline. Older professionals who are the intellectual leaders in their R and D units are likely to find that they cannot make the transition. A vicious circle of stress conditions leading to poor performance will set in.

Although the decline cannot be arrested in the short term, certain measures need to be put in place fairly soon to create the R and D capacity in the medium term that firms will need, if high tech is not to remain forever a ‘black box with buttons attached’ for Indian industry. To this end, the private and public sectors should together commission experts (preferably from high tech exporting countries) to analyse the entire complex of problems and suggest strategies for overcoming them. Mere increases in hardware and software resources, in salaries and perks, and in intra-firm status, will not by themselves be sufficient to generate the motivation and the ambition to solve problems, which only intellectual passion can. Therefore one of the keys will be finding fresh, new recruits with the right cast of mind from the alumni of India’s few high quality science and engineering faculties to join the R and D teams. That will not be an easy task given the preference of the brightest professionals to emigrate to North America or Singapore.

EDUCATION AND MANPOWER

The likely impact of structural adjustment on the public funding of education in developing countries in general is best summarised in the following words from a World Bank study [Noss 1992]:

Adjustment measures (undertaken with or without World Bank assistance) affect education through changes at the macro and micro levels of the economy. Adjustment at the macro level often implies a combination of budget containment measures for the

public education system, limited access to post primary public education and higher user fees for education services at the secondary and tertiary levels. At the micro level, changes in household incomes and prices (user fees, reduced student subsidies) directly influence the demand for education by altering the opportunity cost of attending school. Household incomes also affect health and nutrition status, and thus indirectly influence attendance and learning. Finally, adjustment affects education through changes in markets and infrastructure (resulting from currency devaluation, fiscal and monetary restraint, and price liberalisation) that affect supply of education services and the opportunity cost of attending school...

In plain English what the above-mentioned measures could mean for secondary and higher education in India is first, cuts in public funding, accompanied by the charging of fees, second, a decrease in the number of pupils and students from poorer households; third, a further deterioration of the public education system; and fourth, the strengthening of private education to the benefit of the higher income households.

To go down the route charted by SAP in the area of education is to jump from the frying pan into the fire. India’s development ideology notwithstanding, the Indian government has over the last 40 years neglected primary and secondary education in comparison with higher (tertiary) education. Since the education system has been, and continues to be, almost entirely in the hands of the Indian state, it cannot disclaim responsibility for the inequities and the utter lack of quality that have developed at all levels in the system [Shatrugna 1993; Upendranath 1993b].

The industrial and technological progress of India needs precisely the opposite of what the SAP recommends in education. A rapid advance on a broad front is only possible if the educational and technical levels of all the young in India is raised as a matter of the greatest urgency. That is impossible in the Indian context without increased massive support from the state, but a support that is administered in a radically different way than at present. The need of the hour is not SAP-inspired dismantling of the public education system, but a revolutionary transformation of it to raise the quantity and quality of really skilled young people. What the present system is imparting is not education, but bits of ritual paper certifying that this or that exam has been passed with this or that grade.

To take a leaf out of India’s neighbours in east Asia, their spectacular success in both economic and social development would not have been possible without their single-minded simultaneous pursuit of universalisation of and high quality in primary and secondary education. In quality tests in

science and mathematics administered in the early 1990s to high school pupils across a representative sample of the OECD and the developing countries, with India included, South Korea topped the list, with Japan coming next, western Europe and North America on their heels, and India so far behind as to be invisible in the race.

That said, there is most definitely a need for draconian measures to convert the present higher education system from its present degraded state of being one vast conveyor belt graduate factory into a system that actually imparts knowledge. A re-structuring of public funding based on the criteria of social equity, quality and merit, while simultaneously encouraging higher income groups to take advantage of privatised institutions, would be the strategy to follow.

The present system of government national laboratories and institutes has outlived its original rationale. It is demonstrably not contributing to significant innovation in science and technology. Its impact on industry has been minimal. The move by the present Indian government to progressively reduce its commitment to this moribund system is a wise one. However, that does not mean that the state can afford not to fund scientific and technological R and D – quite the contrary. Again, as with the educational system as a whole, the state needs to pump vastly more resources into R and D, but along the lines of an entirely new strategy. What the new national R and D system should look like and how it should be put together are issues should be publicly debated in India. The ideas that have recently emerged in the advanced industrialised countries on “national innovation systems” would be of seminal value in such a debate and in arriving at future policy decisions [Nelson 1993].

Appendix

HIGH PRIORITY INDUSTRIES WHICH QUALIFY FOR 51 PER CENT FOREIGN EQUITY HOLDING AND FOR AUTOMATIC APPROVAL OF FOREIGN TECHNOLOGY AGREEMENTS.

- (1) Metallurgy
- (2) Boilers and steam generators
- (3) Prime movers (other than electrical generators)
- (4) Electrical equipment
- (5) Transportation equipment
- (6) Industrial machinery
- (7) Machine tools
- (8) Agricultural machinery
- (9) Earth moving machinery
- (10) Industrial instruments
- (11) Scientific and electro-medical instruments, and laboratory equipment
- (12) Nitrogenous and phosphatic fertilisers
- (13) Chemicals (other than fertilisers)
- (14) Drugs and pharmaceuticals
- (15) Paper and pulp, including paper products and industrial laminates
- (16) Automobile tyres and tubes
- (17) Plate glass
- (18) Ceramics
- (19) Cement products
- (20) High technology reproduction and multi-plication equipment

- (21) Carbon and carbon products
- (22) Pre-tensioned high pressure RCC pipes.
- (23) Rubber machinery.
- (24) Printing machinery.
- (25) Welding electrodes other than those for welding mild steel
- (26) Industrial synthetic diamonds.
- (27) Photo-synthesis improvers.
- (28) Extraction and upgrading of minor oils.
- (29) Pre-fabricated building material.
- (30) Soya products.
- (31) High yielding hybrid seeds and synthetic seeds
- (32) All food processing, excluding flour, milk food and malted food, and excluding items reserved for the small-scale sector.
- (33) Packaging for food processing industries, excluding items reserved for the small-scale sector.
- (34) Hotel and tourism related industry.

[This is a shortened and revised version of a study that was commissioned by the South Asia Multidisciplinary Advisory Team (SAAT) of the International Labour Organisation (ILO), based in New Delhi, whose support is gratefully acknowledged. It is a pleasure to thank Rizwanul Islam and Ajit Kumar Ghose of ILO-SAAT for their critical reading of the manuscript and valuable suggestions.]

Technological Capability in Indian Electronics Industry under Economic Liberalisation

Dipayan Datta Chaudhuri

With the process of economic liberalisation in India there has been a remarkable increase in the total number of foreign collaborations in the electronics industry. Public sector units which had earlier adopted a lukewarm attitude towards the import of technology changed their policy stand, and picked up momentum in seeking collaborations in the post-liberalisation period.

This article explores, on the basis of the enterprise level time-series data, the direction of change in technological capabilities of some of the public sector units operating in the field of electronics which have imported foreign technologies.

I

Introduction

DURING the period of economic liberalisation the number of foreign collaborations in electronics has been increasing at a much faster rate than in the industrial sector as a whole [Joseph and Narayana 1993]. This acceleration in the rate of foreign collaborations is likely to increase the technological dependence of Indian electronics industry unless the import of technology is backed by in-house R and D effort for its absorption, adaptation and innovation.

The technological capability of an enterprise is argued to be a function of indigenous research and development, technology imports and relation between the two [Blumenthal 1979]. The import of technologies may either substitute or complement (or a combination of both) indigenous R and D. The available empirical evidence on the nature of relationship between the two has been rather mixed in the case of Indian industries. Katrak (1989) found that the imports of technology helped to promote in-house R and D, but the stimulative impact of the former on the latter was 'limited' especially for the complex technologies. The nature of influence of two alternative modes of technology imports, namely, foreign direct investment (FDI) and licensing agreements, on in-house R and D spending was examined by Kumar (1987). His results indicated that the relationship was of substitution in the case of FDI mode of technology import but it was expected to be dominated by complementarity in the other case. For a sample of 100 Indian engineering firms for the year 1978, Lall (1983) found the royalty payments to be positively related to R and D expenditure (both variables being taken as a percentage of sales) and therefore confirmed the existence of complementary relationship. In another study, using Reserve Bank of India Survey data for 10 years (i.e., from 1964-65 to 1969-70 and again from 1977-78 to 1980-81), Subrahmanian (1987) showed the existence of a very strong complementary relationship except in the case of foreign subsidiaries and concluded that the Indian

firms generally moved along a "technology dependence-independence continuum", primarily because of the greater emphasis laid on the in-house R and D.

Another set of studies by Subrahmanian (1991), Siddharthan (1988) and Mani (1993) treated electronics as a separate sector. Subrahmanian found that the technology-importers did not undertake significantly higher R and D expenditure than the technology non-importers. Siddharthan made a distinction between the public sector and the private sector units, and showed the existence of complementary relationship between import of technology and in-house R and D effort (both taken as percentage of sales) for the private sector firms whereas for the public sector firms evidence indicated to a substitution relationship. However, the existence of complementary relationship in the public sector was confirmed by Mani but he showed that the degree of complementarity was weakest in the electronics sector which had witnessed fast changing technological advances.

These studies analysed the nature of the relationship between the expenditure on imported technology and R and D on the basis of the industry-level data but here this relationship will be examined by using enterprise-level time-series data for some of the public sector units (PSUs) operating in the field of electronics. The fact that an enterprise's imports of technology may affect its R and D can be studied by an empirical analysis of two questions relevant to the R and D behaviour of enterprises in the electronics sector. The first question is whether the level of R and D expenditure is higher amongst the technology importers than in the non-importers. This question also considers whether the expenditures on R and D are likely to differ between certain types of enterprises: large and small, private and public, indigenous and foreign-owned. The second question is whether the technological capabilities of some of the PSUs both at the central as well as at the state levels have been increasing as a result of their R and D expenditure over time.

This article is organised in the following manner. Section II discusses the procedures for the empirical tests. Section III deals with

the sources of data and methods of measurement of variables. Section IV reports the results. Section V summarises the main findings.

II

Procedures for Empirical Analysis

The first question will be examined by introducing a dummy variable in a regression equation. The regression equation will also consider the influence of enterprise size (measured by the annual sales turnover and denoted by 'S') to find out whether larger enterprises undertake proportionately more R and D (denoted by 'RD' in regression equations) than the smaller ones. It will also be interesting to study whether the R and D expenditure is higher for that enterprise which has greater experience in adapting imported technologies. It is, therefore, proposed to include the age of the R and D unit as a proxy for the experience of an enterprise in R and D activities. The regression test will take the form

$$\log RD = a + b \log S + c \log A + d TM \quad (1)$$

where,
TM = 1 for technology importers
= 0 for non-importers of technology
and A = age of the R and D unit measured from the date of establishment.

The log-linear regression form will be used because it will readily show the elasticity of R and D with respect to size (S). Thus, if the estimated coefficient of S turns out to be less than unity, it will mean that an increase in enterprise size leads to a less than proportionate increase in R and D. Alternatively, one can also examine whether the R and D intensity (RD/S) increases with the size of the enterprise and age of the R and D unit and whether it is significantly higher amongst the technology importers than the non-importers by fitting a regression equation of the following form.

$$\log RD/S = a_1 + b_1 \log S + c_1 \log A + d_1 TM \quad (2)$$

If the estimated value for b in equation (1) turns out to be less than unity then this will imply a negative value for the estimated

b_1 in the equation (2). One can also measure the influence of technology by a slope dummy defined as $TM_1 = TM^* \log S$ in place of the intercept dummy TM in the equations (1) and (2).

The R and D behaviour may differ depending on the type of the enterprises such as, private and public, indigenous and foreign-owned, etc. Since the R and D projects of PSUs are financially supported by the department of electronics (DOE)¹ we will run a regression equation of the type $\log RD/S = a_2 + b_2 \log S + e$ PUB (3) where, PUB = 1 for the public sector units = 0, otherwise

to find out whether the R and D intensity is significantly higher in the PSUs than the private-sector units.

The imperfections in the international technology market may have different impact upon (a) indigenous enterprises and (b) subsidiaries of foreign enterprises. The RBI survey (1974) found that companies which had foreign financial collaboration were comparatively less active in setting up R and D units.² It has also been observed that the foreign collaborated companies demonstrate a longer lag in adaptation and assimilation of the imported technology [Pillai 1979]. Among different forms of technology transfer the degree of control exercised by the transferor was found to be maximum in the case of the foreign direct investment [Balasubrahmanian 1973]. So a subsidiary of a foreign multinational may face greater restrictions on the extent to which an imported technology can be adapted. It will, therefore, be interesting to find out whether the research intensities of the foreign-controlled enterprises (i.e., those with 25 per cent or more foreign equity following RBI definition) are significantly less than those of the indigenous enterprises by running a regression equation of the following type $\log RD/S = a_3 + b_3 \log S + FDI$ (4) where, FDI = 1 for foreign-controlled enterprises = 0 for indigenous enterprises

Let us now consider the second question which is concerned with the inter-temporal changes in the technological capabilities of some of the PSUs. The expenditure on technology import (direct cost of foreign collaborations) of an enterprise represents the degree of technological dependence whereas its expenditure on R and D efforts reflects its internal technological capacity. The technological capability of an enterprise is said to be increasing so long as the proportionate increase in the R and D spending exceeds that of expenditure on imported technologies. The logic is that as a firm spends more on R and D, its knowledge on technology becomes richer. Since the cost of technology transfer depends largely upon the relative bargaining strength of the buyer and the seller, with a better

technological knowledge the buyer can now be at a better position in bargaining and thereby, can bring down the cost of technology imports [Teece 1977; Lall 1980].

Following the lines suggested by Katrak (1985) we adopt a procedure for measuring the technological capability. Let 'EM' denote the expenditures on imported technologies. The 'average propensity to adapt' is RD/EM . An increase in this propensity will imply an improvement in an enterprise's technological capability. Since it is a static concept we also introduce the marginal propensity to adapt as $\partial RD/\partial EM$. Now the ratio between the marginal and average propensity to adapt ($\partial RD/\partial EM / RD/EM$) will

be the "elasticity of R and D with respect to the technology import". This elasticity is a measure of the relative change in R and D to a proportionate change in the cost of technology import. The data of RD and EM will be used to fit a regression equation of the following form to estimate the elasticity $\log RD = \alpha + \beta \log EM$ (5) Here the regression coefficient β will give an estimate of the elasticity. A value of β greater than unity will be interpreted as evidence of increasing technological capability of the enterprise. Conversely, if the estimated β is less than unity the result will be interpreted as showing increasing dependence of imported technologies.

TABLE 1. MAJOR PRODUCTS AND FOREIGN TECHNOLOGY COLLABORATION AGREEMENTS OF THREE PUBLIC SECTOR UNITS IN ELECTRONICS

Name of the Unit (Year Incorporated)	Major Products	Foreign Technology Collaboration Agreements	
		Technology Supplier	Products
Electronics Corporation of India (ECIL) (1967) (Central Public Sector Unit)	Digital computer systems	Siemens, West Germany (erstwhile)	SPC telex exchange
	Colour television receiver sets	Norsk Data, Norway	Supermini computer
	Black and White TVs	Ferranti, UK	Remote telemetry units
	Telex exchange equipment	NEC, Japan	Digital transceivers
	Nuclear power plant instrumentation	Kabelmetal Electro, West Germany (erstwhile)	Line of Sight Antennas
	Control panel, Defence equipment	Control Data Indo-Asia Co, (CDC), USA	Mainframe computers
	Two-way wireless communication sets	FAG, West Germany (former)	Microprocessor-based thickness gauges
	Passive components	Harris Ferinon, Canada	Communication system
	Printed circuit boards	Thermocoax Et Cie, France	Self-powered neutron detectors
	High power amplifier systems	RACAL, UK	V-UHF receivers
	Antennae with feed (of various sizes)	Varian, USA	400W HPA
	Bipolar/MOS large scale integrated circuits	Hitachi, Japan	Digital electronic watch models
Semiconductor Complex (SCL) (1978) (Central public sector unit)	LSI/VLSI devices	American Microsystems (AMI), USA	5 micron and 3 micron CMDS and MOS silicon gate technologies
	Bipolar/MOS large scale integrated chips (LSI/VLSI) chips (silicon chips)	Citizen Watch Co, Japan	Assembly of ECB
	Electronic circuit blocks	Rockwell International, USA	Microprocessor and peripheral devices
	Printed circuit boards	CIT Alcatel, France	LSI devices
	Radio relay communication equipment	Genelcom, a subsidiary of GEC, Canada	Extended range VHF equipment
Gujarat Communications and Electronics (GCEL), (1975) (State public sector unit)	Instrument landing system	Sony Corporation, Japan	U-MATIC Video equipment and high band VCRs
	Video Tape Recorder	Robert Bosch, West Germany (erstwhile)	Video tape recorder
		Siemens, West Germany (erstwhile)	Electronic telephone instruments
		Rohde and Schwarz, West Germany (erstwhile)	FM transmitters
		Ampex (country not available)	Digital video effects

Source: Annual Reports of GCEL, SCL and ECIL (various issues).

The regression equation of the type (5) can be run for the two central public sector units (CPSUs), namely, Electronics Corporation of India (ECIL) and Semiconductor Complex (SCL) and a state public sector unit (SPSU), namely, Gujarat Communication and Electronics (GCEL) (Table 1). Since the process of liberalisation was discernible from 1978 the time-series data on R and D and expenditures on imported technologies were collected from that year for GCEL but, for ECIL and SCL such data could be obtained from 1981 to 1990. To overcome statistical limitations arising from fewer number of observations for each unit, these data of the three units were pooled to estimate the regression of the following type where D_1 and D_2 are the two intercept dummy variables

$$\log RD = \alpha_1 + \beta_1 \log EM + \beta_2 D_1 + \beta_3 D_2 + \beta_4 D_1 \log EM + \beta_5 D_2 \log EM \quad (6)$$

where, $(D_1, D_2) = (1, 0)$ for ECIL
 $(D_1, D_2) = (0, 1)$ for SCL
and $(D_1, D_2) = (0, 0)$ for GCEL

III Data and Measurement of Variables

Empirical analysis in the framework suggested above requires two sets of data. One set of data was collected from *Compendium on In-House R and D Centres, 1990* published by the department of scientific and industrial research (DSIR) on the basis of a survey of the firms registered with it. This compendium provides quantitative data such as, R and D expenditure, sales turnover, the year of establishment of the R and D unit and also qualitative information on the basis of which it is possible to separate out technology-importers and non-importers, public sector and private sector units, foreign-controlled enterprises and indigenous enterprises.

The second set of data on the R and D expenditure, sales turnover, expenditure on imported technology were collected from the annual reports of the ECIL, SCL and GCEL. All these variables were measured at the constant prices with reference to the base year 1981-82. The items belonging to the capital account of R and D expenditure were deflated by the price index of machinery and machine tools including electrical machinery and the revenue account expenditure of R and D of a unit was deflated by the consumer price index for urban non-manual employees of that place where the unit is situated.¹ These price indices were obtained from H.L. Chandhok's (1990) 'India Data Base'. Since this source provides price-index data up to 1988-89, the price-index for the year 1989-90 was collected from the *Report of Currency and Finance* published by RBI. With regard to the sales turnover

the sales items of each unit were identified and their prices were obtained from the *Guide to Electronics Industry*, a DOE publication. In the case of the units selling more than one item, a weighted price index was constructed where the share of each item in the total sales turnover was taken as the weight. The direct cost of technology import (EM) was measured as the out-flow of foreign exchange due to the technical know-how fees, royalty and interest payment, professional consultancy fees, advances to foreign suppliers of technology and the imports of capital goods as the imported capital equipment may embody a certain kind of know-how. The price indices for these items are not available. During the period of our study, the rupee experienced a continuous depreciation against the major currencies of the world and our domestic rate of inflation was much higher than in other developed countries from which the technologies were imported. So, the time-series figures of the direct costs of technology imports were deflated by the real effective exchange rate (REER) which is a weighted average of bilateral price-deflated nominal exchange rates.⁴ A problem in searching for an empirical relationship between the import of technology and R and D is that latter activity may be undertaken a year (or more) after the former. Considering this possibility our data were further analysed and it was decided to regress the R and D expenditure of any year upon the average of the

technology expenditure of that year and a year before.

IV Empirical Results

The first question was examined by running few regression equations [discussed in Section II] and the results are reported in Table 2.

The positive signs of the technology-import dummies TM and TM_1 in equations (1) to (4) indicate that both the level of R and D expenditure and the R and D intensity were higher amongst the technology importers than the non-importers. Thus, in this sense, it seems that the imports of technology encouraged R and D as the imported technology was required to be adapted to the local conditions. Such a kind of adaptive R and D might also be undertaken in solution of problems such as breakdown of machinery, shortage of imported components, etc. However, this stimulating effect of imported technology upon R and D was limited, since the technology import dummies, at best, could reach only the 5 per cent level of significance.

In equations (1) and (3) the coefficients of $\log S$ are positive and significant at the 1 per cent level but less than unity.⁵ This indicates that the larger enterprises undertook proportionately less R and D than the smaller ones. This outcome also followed from the fact that the coefficient of $\log S$ are negative

TABLE 2 LOG-LINEAR REGRESSION EQUATIONS EXPLAINING R AND D IN ELECTRONICS SECTOR

Equations	Dependent Variable	Regressions						
		Constant	S	A	TM	TM ₁	PUB	FDI
(1)	RD	-.038015 (-.07347)	31547*** (3.7356)	.05539 (.37415)	55065* (1.8835)

in the equations (2), (4), (5) and (6) indicating significantly lower research-intensities in the larger enterprises. It seemed that the greater market power and the absence of competitive pressures reduced larger enterprises's incentive for R and D.

In equations (1) and (2) the coefficients of log A are positive but not statistically significant. Thus, the experience of an enterprise in R and D activities did not make any significant influence upon its R and D expenditure or its R and D intensity.

The two dummy variables were introduced in equations (5) and (6) to examine the R and D behaviour of certain types of enterprises: public and private and indigenous and foreign-owned. It can be observed from equation (5) that the research intensities did not differ significantly between the public and the private sector enterprises. One would have expected higher research-intensities for the PSUs since their R and D projects are generally financed by DOE. But, it seems that in an era of liberalisation, both the public and the private sector units prefer to import package technology which does not require much R and D activities. The equation (6) shows that the research intensities of the foreign-controlled enterprises were not significantly less than those of the indigenous enterprises. A possible explanation is that the dummy is reflecting two opposing effects: thus whereas indigenous enterprises might have greater scope for determining their own R and D efforts, they might also have relatively less assistance from their foreign suppliers in the assimilation of the imported technology.

The second question is concerned with the technological capabilities of some of the PSUs in the field of electronics. This question was examined by pooling the time-series data pertaining to the two CPSUs (i.e., ECIL and SCL) and one SPSU (i.e., GCEL) and a regression analysis was undertaken to obtain the following regression equation

$$\log RD = -.074656 + 1.1044 \log EM \\ (-1.5059) \quad (3.4289) \\ + 1.9906 D_1 + .21940 D_2 \\ (3.6882) \quad (.33309) \\ -.99699 D_1 \log EM - .41715 D_2 \log EM \\ (-2.9613) \quad (-1.1663)$$

$$R^2 = .77880 \quad \bar{R}^2 = .72614$$

Figures in brackets denote t-values.

TABLE 3: ELASTICITY COEFFICIENTS OF THREE PUBLIC SECTOR UNITS

Name of the Unit	Elasticity Coefficients	t-values
(i) GCEL	$\hat{\beta}_1 = 1.1044^{***}$	3.4289
(ii) ECIL	$\hat{\beta}_1 + \hat{\beta}_2 = .10741$	1.0954
(iii) SCL	$\hat{\beta}_1 + \hat{\beta}_2 = .68725^{***}$	4.4189

Note:*** denotes significance at 1 per cent level.

Source: Computed from the annual reports of ECIL, SCL and GCEL.

The elasticity coefficients of the three PSUs are represented in Table 3.

The regression results establish the existence of complementary relationship between R and D and technology-import expenditure for all the three PSUs, although the relationship was not statistically significant in the case of ECIL (Table 3). The elasticity coefficient exceeded unity only in the case of GCEL. So, following our definition, among the three PSUs only GCEL was able to strengthen its technological capability through its R and D efforts. Although being a state public sector unit the scale of operation of GCEL, measured in terms of average sales turnover, was much lower than the two CPSUs but its research-intensity was the highest (Table 4). GCEL also enjoyed an increase in the propensity to adapt over time, whereas it declined in the case of ECIL (Table 5). However, the propensity to adapt increased only marginally for SCL.

It can be observed from the Table 4 that GCEL was a profit-earning enterprise so apart from the financial help from DOE, it was able to generate surplus funds which could be used to back up the import of technology with indigenous R and D. It can be recalled here that the telecommunication sector was reserved for the PSUs only till mid-1980s. Thus, GCEL, under the influence of government's protective policy was able to facilitate its technological capability. On the other hand, ECIL was also a profit-earning enterprise but its growth rate of R and D expenditure was so low that it could not match with the very high growth rate of its expenditure on imported technology as a result not only its propensity to adapt declined, it also experienced an increase in the import intensity of the technology over time (Table 5). With the shift in the government's policy from 'protectionism' to 'liberalisation', ECIL which had not entered into any foreign collaboration till 1978, signed five foreign collaboration agreements in 1986 alone. It also ranked seventh among the 10 largest importers of foreign technology in the Indian public sector having a total of 15 such collaboration approvals till 1986. ECIL was engaged in

manufacturing indigenous computers during 1970s but it started assembling CKD/SKD kits imported from its foreign collaborators during 1980s. This kind of 'kit-culture' provided very little scope for undertaking any worthwhile R and D activities.⁶ The large number of foreign collaboration agreements of ECIL accounted for a very high rate of increase in its expenditures on the imported technologies which were not backed up with indigenous R and D efforts in the same intensity as a result the technological dependence of ECIL increased over time (Table 5). Moreover, the technologies imported were not the state-of-the-art. The electronics telex exchange technology from Siemens and mainframe technology from CDC when brought by ECIL were about to be phased out in the global market.⁷ It should be noted here, that GCEL did not enter the export markets whereas the two CPSUs were engaged in exporting their products. It is also possible that the CPSUs were less assisted by their foreign suppliers in the assimilation of the imported technologies as they were viewed as potential competitors in the export markets. This kind of 'oligopolistic squeezing' very often hinders the development of technological capabilities of Indian enterprises⁸ [Bagchi 1982; Alam 1985]. It should be noted from Table 5 that the R and D intensities of all the three PSUs declined over time. In this sense, PSUs are becoming less R and D oriented and the efficiency of resource utilisation (measured as the ratio of value-added to total production, [Bagchi 1986] also declined during the period of liberalisation (Table 5).

However, among the three PSUs only GCEL, even being in a state sector, has shown better performance so far as the development of technological capability is concerned. It even developed Time Division Multiple Access (TDMA) Communication system when the concept of TDMA had yet to get transformed into practical hardware and moreover, no field proven equipment of this type was available in the country. This project was, however, supported by DOE by providing GCEL with R and D funds for the design, development and

TABLE 4: SALES TURNOVER, R AND D INTENSITY, AND IMPORT INTENSITY RATIOS OF THREE PUBLIC SECTOR UNITS (1981-82 = 100 unless otherwise stated)

Name of the Unit	Sales Turnover (Rs in Lakh)	Profitability (at Current Prices)	R and D Intensity	Import Intensity of the Technology
ECIL	13,666.56	0.04	0.01	0.02
SCL	2,298.50	(-) 0.02	0.17	1.31
GCEL	701.89	0.08	0.27	0.33

Notes: (i) These are average figures calculated over the study period of each unit.

(ii) Profitability was measured as the ratio of profit after tax to the gross fixed assets.

(iii) Import intensity of the technology was measured as the ratio of the expenditures on imported technologies to the sales turnover.

(iv) SCL could not achieve break-even operations till 1987-88.

engineering of the system. In barely two years and nine months with a cost of Rs 1.5 crore the TDMA Communication System became a reality. At first, this system was successfully used by Steel Authority of India (SAIL) in its Kiriburu complex and later on, it was also supplied to the Railways, Coal India and the State Electricity Boards GCEL, also played a pivotal role in developing Pulse Code Modulation (PCM) Multiplex Equipment which was required for converting our entire communication network into a digital one. Till 1981, to meet requirements prevailing at that time, the department of telecommunication (DOT) had been importing this equipment from Japan. But seeing that there could be large requirements in the Seventh and Eighth Plans, Indian Telephone Industries (ITI), at the instance of the DOT started negotiations with a leading multinational company for acquiring foreign technology to make this equipment. Meanwhile, GCEL offered to Telecommunications Research Centre (TRC) to produce PCM Multiplex Equipment based on TRC's indigenous design and know-how. While doing so GCEL recognised that the per channel Codec design of TRC was superior to the Codec design of the multinational company. Accordingly, GCEL engineered the TRC design, and produced a batch of PCM terminals for field trials by DOT. These trials were satisfactorily completed by the end of 1983. With such excellent progress made by the GCEL TRC team the government decided that ITI could not proceed with its proposed technical collaboration with the multinational company for PCM multiplex equipment, but would, instead, also make the equipment as per the GCEL-TRC design [Parthasarathi 1992]. SCL also had its success when it was able to reach 2 micron technology in 1988, without any cost or time overrun starting from 5 micron under its technology upgradation plan.⁴

The government policy of liberalisation encouraged the induction of foreign technologies which were expected to improve our product qualities and to accelerate the growth rate of our exports. This kind of export-led-growth, apart from increasing income and employment, was also likely to ease the foreign exchange burden of our country. It will be interesting to study whether the net earnings of foreign exchange of these PSUs increased during the period of liberalisation. This can be measured with the help of 'Net Foreign Exchange Inflow Ratio' (NFIR) which is defined as

$$\text{NFIR} = \frac{\text{Exports} - (\text{Imports of goods} + \text{Imports of technologies})}{\text{Exports}}$$

The trends of NFIR for ECIL and SCL are reported in Table 5. The values of NFIR

are negative throughout the period under consideration indicating higher outflows of foreign exchange than inflows. The negative trend of NFIR did not show any declining tendency in either case, therefore, it could not be asserted that the import dependence of these CPSUs was decreasing over time.¹⁰ Thus, the fond hope behind the government's policy of liberalisation has so far shown no sign of materialisation so far as the earnings of foreign exchange are concerned. The import intensity of the electronics industry is very high¹¹ and the electronics equipment and components manufacturing units taken for this study are found to be net spenders of foreign exchange¹² so one wonders whether a country like India with a weak 'macroeconomic capability' [Bagchi and Banerjee 1986] can afford to develop new technologies on a massive scale.

V

Summary and Conclusions

The liberalisation policy of our government encouraged the import of foreign technologies by Indian enterprises. Here, we have examined whether the technological capabilities of the Indian enterprises in the field of electronics have been increasing as the imports of technologies are expected to stimulate in-house R and D efforts. This was studied first, by introducing dummy variables in a regression analysis which indicated that both the levels of R and D expenditures and the R and D intensity were higher amongst the technology importers than the non-importers. However, the stimulating effect of imported technology upon R and D was found to be limited. Then the time-series R and D data were regressed upon the data on expenditures on imported technologies of the three public sector units. Although the regression analysis established a complementary relationship between the two variables only one unit was able to increase its technological capability through its R and D efforts. However, all the three units turned out to be net spenders of foreign exchange and their import dependence did not show any

definite declining trend over time. The regression also found that the larger enterprises incurred proportionately less R and D expenditures. It was also observed that the R and D intensities did not differ significantly between the public and the private sector enterprises and between the indigenous and the foreign controlled enterprises.

The high growth rate of the electronics industry during the early 1980s could not be sustained during the late 80s [Joseph and Narayana 1993]. Moreover the factor productivities also declined over time indicating growing inefficiency in factor use. Here we have observed that the R and D intensities of all the three public sector units declined during the period under study. Although this result cannot be generalised it cannot be denied either that the Indian enterprises are becoming less R and D oriented due to the emergence of the kit culture. The government should intervene to ensure that the import is sufficiently backed up with domestic R and D so that apart from increasing the technological capability the efficiency of resource utilisation also increases which is likely to arrest the declining trend in productivity and output.

TABLE 6 TRENDS IN NFIR FOR TWO CENTRAL PUBLIC SECTOR UNITS

Year	ECIL	SCL

ENVIRONMENT PROTECTION AND POLLUTION CONTROL IN THE GANGA

Edited by
P K Agrawal

The book exposes the latest global developments in the field of environment and river pollution control, with particular reference to Ganga. Based on the reports of various UN bodies, such as Ganga Action Plan, the editor has really presented a model project to clean the Ganga.

Indian Software Exports: An Assessment

Pronab Sen

Until 1991-92 there was virtually no policy support for the software sector. Since then the government has taken a number of positive steps, but hesitantly. The general perception about the software industry however continues to be that it will rapidly attain international stature without any policy support.

Addressing the issue, this paper analytically examines the behaviour of software exports from India, and makes some policy prescriptions.

I

The Symptoms

THE remarkable growth of Indian software exports from a mere Rs 71 crore in 1987 to Rs 700 crore in 1993 – an increase by a factor of 10 in six years¹ – has sparked off peculiar syndrome which may have far-reaching consequences in the future. On the one hand, there are high expectations from this sector, and it is firmly believed that this is one of the few areas in which India has the potential to become a global powerhouse. On the other hand, the degree of euphoria, virtually bordering on arrogance, is such that it is apparently believed that nothing much needs to be done in terms of policy support for this sector. This syndrome has been further reinforced by studies which suggest that software exports are likely, in any case, to touch US \$ 640 million by 1996, and with a little bit of effort US \$ 1 billion is also attainable in the same time frame.² As a consequence, the focus has shifted away from the fundamentals to the marginals.

If this sounds like hyperbole, consider the following policy stances. In 1992 the government extended the tax exemption on export profits available to merchandise exporters through Section 80-HHC of the Income Tax Act to software exporters by introducing Section 80-HHE. The difference, however, was that while Section 80-HHC had currency of five years, Section 80-HHE was on an annual basis. As a result, there has been a constant uncertainty regarding the renewal of this section, and hence the expected net profit of the exporter, which has affected all software contracts which span two or more financial years. In such a situation it is almost impossible to fix a firm price for the duration of the contract.

Other than this basic difference between Sections 80-HHC and 80-HHE, the very similarity between the two sections reveals a lack of appreciation by the policy-makers of the characteristics of the software industry. While framing Section 80-HHC, it was clearly recognised that profits on exports were negligible or even negative for most merchandise, whereas substantial profits were made on domestic sales. Therefore, in order to make this instrument serve as a real export incentive, a method of "profit averaging" was devised so that exporters

could actually claim a part of their profit on domestic sales as export profits. This was achieved by multiplying the ratio of export turnover to total turnover and the total profits of the company in calculating 'export profits' for the purposes of this section. Since domestic turnover is usually computed on the ex-factory price, the export turnover was defined as the invoice value less transportation costs in order to maintain consistency.

It can be shown that this formula will overstate the export profit if two conditions are met: (a) the percentage profit margin on domestic sales is higher than on exports; and (b) transport costs form a small percentage of export turnover.³ Both these conditions are met for merchandise, where profit on exports is substantially less than profit on domestic sales and transport costs form only about 3 per cent of the invoice value. Unfortunately, both the formula and the definition of export turnover were retained while formulating Section 80-HHE, thereby substantially reducing the incentive value of this provision and indeed giving rise to a most undesirable characteristic.

The reasons for this contrary effect are first, that in the software sector profits on exports are considerably higher than on domestic sales.⁴ As a consequence, profit averaging actually leads to a part of export profits being counted as profit on domestic sales, and thereby being subject to tax. Second, to make matters worse, transport costs for the software sector have been defined to include both international telecommunication charges and the cost of sending employees abroad.⁵ These two together can account for as much as 40 per cent of the invoice value in software exports. This causes the share of exports in total turnover to be much less than actual. The net result of this *pari passu*, rather than *mutatis mutandis* application of the provisions of Section 80-HHC to 80-HHE is that not only do the software exporters have to pay tax on legitimate export earnings, but that the extent of such taxation increases as domestic sales rise. This provides a strong disincentive for software companies to address the domestic market, which in turn has serious negative long-run implications.

Second, Sections 10-A and 10-B of the Income Tax Act, which provide income tax relief to export processing zones (EPZs) and

100 per cent export-oriented units (EOUs), were extended to software exports from such schemes in 1993. Here again, software companies which have been in existence prior to 1993, and which form the core of the software exports of the country, have been excluded by oversight. As a result, the policy discriminated in favour of start-up companies and against established software exporters. Third, in 1992 certain specific software activities were declared to be areas of 'extreme focus' for export thrust by the ministry of commerce. In none of these identified activities India had any significant presence. Therefore, if this pronouncement was to be taken seriously, efforts at developing demonstrated competence in these fields in India would have to be taken up in a concerted manner. As yet no such plan of action exists, even on paper. These are only illustrative of the ambivalent attitudes that have characterised our approach to software exports. They can be multiplied many times over. It should not be thought, however, that the software sector has been totally neglected. In fact, the year 1991-92 marks a watershed in terms of policy support for this sector. The above cited examples are aberrations which have crept in primarily because of the lack of adequate communication and differences in perceptions that exist within the governmental system.

Until 1991-92, there was virtually no policy support at all for the software sector. Even 'benign neglect' would be too positive a phrase to use in this connection. The primary vehicle of Indian software exports – on-site software development – was pejoratively termed as 'body-shopping'⁶ and every effort was made to discourage it.⁷ There was virtually no effort at understanding why software exporters behaved the way they did. In retrospect, considerable credit has to be given to the software sector for pushing ahead despite the lack of support from the government.

Since then, however, the government has taken a number of positive steps, albeit haltingly. Even so, there continues to be a lack of appreciation of the requirements for software exports in the wider government milieu. The popular perception appears to be that India already has all the ingredients for a successful software sector, and the demands for positive policy support are

FIGURE 1 TRENDS IN SOFTWARE EXPORTS

important at best. The real issue, therefore, is that whether there is any basis for this self-satisfied sanguinity that the Indian software industry will rapidly attain international stature without any active policy support.

In order to address this issue, there is need to analytically examine the behaviour of software exports from India. The basic data is given in the Annexure. The time path of software exports in rupees and in US dollars are plotted in Figure 1. As can be seen, a substantial part of the reported growth in software exports has come about through devaluation of the rupee against the dollar particularly since 1991. The decomposition of the growth in the rupee value of software exports into the real growth measured in dollar terms and the exchange rate effect is given in Table 1.⁴

The interesting point to note about this table is that the 'real' growth rate has actually slipped during the latter half-period (1990-93), which is precisely the period in which the software sector has given rise to such strong expectations. It can also be seen that during this period, the 'real' and the 'exchange rate' effects have been more or less equal, which was certainly not true of the earlier period when the 'real' growth dominated. The differential performance in the two periods also cannot be put down to differences in the base, since the arithmetic mean of the growth rates of the two sub-periods are not significantly different from the full-period average, which would have been the case if there had been a base problem.

Casual empiricism based on this data and analysis would give rise to most disquieting conclusions. One would be tempted to infer that the software sector is starting to lose steam, despite the not inconsiderable growth rates that continue to be achieved. To make matters worse, this slowing down appears

to have taken place precisely during the period when some policy support started being provided. This simply lends further credence to the proponents of the point of view which holds that software exports do not need such support, and more rapid growth is possible if the software entrepreneurs did not mangle.

In order to examine the situation in somewhat greater detail, an econometric analysis of the trends in the dollar values of software exports becomes necessary. Given the wide variations in the quarterly exports data, simple trend equations were not appropriate. More complex equations involving both intercept and slope dummies for the different quarters had to be specified and estimated for linear, quadratic and exponential growth paths. The results of such an exercise are presented in Table 2.⁵

The results are extremely interesting. As may be seen from the table, until 1992-93, the linear trend equation is consistently superior to the exponential. This suggests that the decline in the compound growth rate indicated in Table 1 arises not so much from a downward shift in the growth path, but from the fact that a compound growth rate is an inappropriate measure of the true growth path. This is further borne out by the steady decline in the coefficient of the trend variable in the semi-log equations. On the other hand, it raises the question as to why the software exports followed a linear path in a world that tends to behave exponentially.

Since 1992-93, however, there appears to be a change, in that the semi-log trend starts dominating the linear. This seems to suggest that there is a substantial change in the behavioural attributes of the software export sector, and that the future growth may well turn out to be exponential. This possibility is reinforced by the robustness of the

estimated parameters in the equations covering the periods 1987-93 and 1987-94.

However, on the one hand, it may be pointed out that the difference between the explanatory powers of the linear and the semi-log equations are not very different, and hence one cannot be too confident about this shift to an exponential growth path. On the other hand, even if the exponential growth path were to be attained, the annual compound growth rate has dropped sharply from 44.3 per cent in 1990 to 25.8 per cent by 1994. Therefore, what is the level of software exports that can be expected in the next few years?

There is of course no real answer to the first question, since the period available is still very short. Only time will tell. But the robustness of the parameters is an encouraging sign. The importance of shifting from a linear to an exponential growth path cannot be overemphasised even for the relative short run. In order to fully appreciate the importance of such a shift, one need only consider the projected software exports over the next few years. These projections, both for the linear and the exponential growth paths, are presented in Figure 2. As can be seen, the two projections diverge quite substantially. In 1997, if an exponential growth trend is maintained, the level of software exports should be about US \$ 630 million. With linear growth however, it is unlikely to exceed US \$ 330 million.¹⁰

II The Diagnosis

The important issues that arise from the description of the symptoms presented in the preceding section may be summarised as follows:

(1) What are the reasons for Indian software exports to have followed a linear growth path? (2) What hope is there for permanently shifting to an exponential path? The first point that needs to be realised about the software sector is that it is not physical capital intensive, but extremely intensive in human capital. As a result, the growth in this sector does not arise primarily from investment in plant and machinery, as is the case with physical products, but from two principal sources: (a) The number of persons (or man-years) engaged in this activity; (b) The productivity of the manpower in terms of revenues per person.

TABLE 1 DECOMPOSITION OF GROWTH IN SOFTWARE EXPORTS

Period	Total Growth (Per Cent)	Real Growth (Per Cent)	Exchange Rate (Per Cent)
1987 to 1993	46.4	28.0	18.4
1987 to 1990	41.2	29.1	12.1
1990 to 1993	51.8	27.5	24.3

FIGURE 2: SOFTWARE EXPORT PROJECTIONS

The exponential nature of most economic processes arises mainly from what Marx termed as 'expanded reproduction', or the process of cumulative accumulation of capital. In the software sector, unfortunately, this process has only limited applicability.¹¹ Human capital tends to follow 'simple reproduction' behaviour. The reason for this is that the generation of the right type of manpower does not come about through the operation of normal economic forces, but as a result of deliberate decisions taken by the educational system. This is probably at the root of the linearity of the Indian software experience.

Although the Indian educational system as a whole has expanded quite substantially, there is a bottleneck at the institutions which are capable of producing software professionals of international standard for the kinds of jobs that are being undertaken at present. The available data suggest that there has been no expansion in the number of graduates coming out of these institutions per year for the past 10 years or more. This is a linear process.

Moreover, the Indian educational system has been most unresponsive to the educational and training needs of the economy. Although the structure of the Indian economy has changed quite dramatically in the last two decades or more, the changing composition of skill requirements has had very little effect on both the proportion of students in various disciplines and the curricula in the educational and training establishments. The net result is a growing imbalance between the demand and supply of different skills. The problem is particularly acute for sectors which are new and growing rapidly - like software. This strong auto-regressiveness of the educational system is probably the single-

most important cause of the observed linearity.

However, this is only part of the explanation. The failure of the Indian system is of a wider dimension. Despite the linearity in appropriate human capital formation, sustained exponential growth could still have been recorded through two methods: (a) Addressing more intensively those specific segments of the international software market for which trained manpower availability would not be a binding constraint in the foreseeable future. (b) Increasing the productivity of the scarce existing manpower by moving progressively to higher value activities. The fact that neither of these happened in any significant way calls for an explanation. The software sector can be divided into five

major activities in declining order of complexity and skill requirements: (1) Project management, (2) Systems analysis and design, (3) Software maintenance and support, (4) Writing of code, and (5) Data entry. As things stand, the Indian software sector has been and continues to be concentrated in the second and the fourth activities with a heavy predominance of the fourth.

Data entry for the international market is virtually non-existent despite the fact that this is the one area where the resource endowment of the country is the best. The primary reason why no headway has been made in this area is the lack of adequate data communication facilities in the country which causes long time lags between the receipt of documents and their supply in machine readable form. Also, correction of data entry errors, which can never be entirely eliminated, becomes more time-consuming and cumbersome. This has inhibited foreign clients from using India as a base for their data-entry needs.¹² This is a pity since the data-entry activity, though low value in nature, is the one area in which manpower resources would not be a constraint, at least in the foreseeable future.

The situation with software maintenance and support is similar perhaps even worse since this is the fastest growing segment of the international software market. At present India has practically no presence in this area, despite its inherent comparative advantage. The primary culprit for this state of affairs is again the lack of adequate telecommunication facilities. This lack is particularly onerous in this sphere since software maintenance requires remote logging as a minimum precondition and customers insist upon the control that is achieved by on-line access.

TABLE 2: TREND EQUATIONS FOR SOFTWARE EXPORTS

	1987-1990		1987-1991		1987-1992		1987-1993		1987-1994

Note: The t-statistics are shown in brackets.

The lack of high-speed data communication facilities has ramifications which go well beyond the restrictions it placed on the data-entry and software maintenance activities. The preponderance of 'on-site' software development in total software exports can also be traced largely to this factor.¹³ Indian companies simply had no option but to take recourse to this method of carrying out business. The end result was that not only did it increase the costs to the software companies, it placed severe restrictions on the nature and type of jobs that could be undertaken. Since it was clearly not feasible for any single company to send out large teams of software professionals for any single client, Indian software firms were limited to carrying out relatively small jobs acting as sub-contractors in a large project.

What was much worse, however, was that it led to a gross underutilisation of talent. Since there was a restriction on the number of people who could be sent out, Indian software engineers not only did systems analysis and design, they also had to write the code. The latter activity is relatively more time-consuming, but requires much lower levels of skill. In most other countries, software engineers almost never write code. As a result of this pattern, Indian professionals have had to work well below their capabilities. Consequently, although the average salary of an Indian software professional is only about 15 per cent of an American counterpart, his productivity is probably no more than 30 per cent. Therefore, the real cost advantage enjoyed by India is not that large once this under-utilisation of talent is taken into account.

The logical solution to this problem would be to have the software engineer doing only systems analysis and design, and employ lower skilled personnel to do coding, at least for offshore jobs. This will no doubt happen in due course of time as offshore work starts to grow, which in turn will require the datacom facilities to be upgraded quite substantially. It will also require much higher degree of project management skills – which is virtually absent at the moment.

Perhaps the recent tentative move towards exponentiality in software exports is due at least in part to the fact that the share of offshore work in total software exports has gone up to almost 30 per cent in the past three years after being stagnant at less than 10 per cent for the previous decade. On the other hand, the same phenomenon can be cited for arguing that some of the recent growth in software exports is only window dressing. The argument is that typically in on-site jobs, the costs incurred at the customer's location were borne by the customer and did not get reflected in the gross foreign exchange earnings of the exporter. In the case of offshore jobs, however, costs of hardware, datacommuni-

cation and even travel are built into the gross export value. As a result, the difference in gross earnings between offshore jobs and on-site jobs tends to be very high, although the difference in net values is probably considerably lower.¹⁴

On the whole, however, the diagnosis is that the Indian software sector has suffered from both a limitation in the availability of skilled personnel and stagnant productivity. Some of the reasons for this have been enumerated in the above discussion, but there are many others which also have had a role to play. It is useful to discuss these at some length, since they point to a larger systemic failure and therefore highlight the need for much greater degree of co-ordination than exists at present.

First, the Indian educational system is completely outdated in the sense that the both computer literacy and algorithmic or modelling skills are virtually untaught except in the engineering colleges and certain pure science disciplines. In actuality, software development does not really require engineers, it only needs certain mathematical skills. As a matter of fact, professionals from non-engineering disciplines can contribute more to software exports, provided they are given the requisite orientation in their basic undergraduate education.¹⁵ At present there is a programme to inculcate computer literacy in schools, but that will take another five years or so to fructify. Unfortunately there is no such programme in colleges. This needs to be corrected urgently, not only for the software sector, but for most modern industrial/service activities.

Second, the telecommunication system in India is still very voice-oriented, and there is a total lack of appreciation of the role and importance of datacom. What is worse is that although high-speed datacom facilities are becoming available to the rest of the world, intra-country connectivity is still quite distant. This has two major ill-effects. First, most software professionals, including those from engineering backgrounds, receive practically zero exposure to datacom-based work methods during their formal education. Most of these skills have to be taught on-the-job by the employers. If domestic datacom connectivity is not available, the learning curve is perforce based on the relatively high cost international facility, which can only be used sparingly. This restricts the spread of such skills. Secondly, the hardware platform base of the country cannot be used effectively by time-sharing. While this may not be a serious problem for large software companies, which have enough work on hand to fully utilise their hardware base, it is extremely detrimental to the smaller companies. The ill-effects are further compounded by the relatively high cost of hardware in India vis-a-vis the competitor countries.

Third, the domestic software market has been limited not only by the extremely high cost of hardware, but also by an unwillingness to pay for software. In fact, most major users in India tend to rely heavily on in-house EDP divisions/cells rather than on commercially developed software. The government is the biggest culprit in this respect. There is of course good reason for such behaviour. For most major users, it is cheaper to hire software personnel directly rather than bear the costs of the overheads of commercial software companies, which can be as large as two-and-a-half times the salary bill. This arises primarily from the relatively low salaries that are paid in India. In other countries, with much higher salaries, such behaviour is not optimal. As a consequence of this tendency, Indian software houses have very little exposure in carrying out large jobs which leads to both a lack of project management experience and a lack of track-record.

This tendency on the part of major users to rely on in-house software development has certain other dimensions which need to be noted. First, the existence of such units leads to a reduction in the trained manpower available to the commercial software sector, which simply aggravates the basic shortage that exists. Second, since most of these units are treated as providing service or staff functions, the software capabilities that are developed are rarely used to the extent possible. Thus the considerable project management and systems design skills that are generated tend to be wastefully used. Finally, since the 'make or buy' option is biased in favour of the former for the large users, the residual domestic demand is restricted to fairly small or intermittent users who cannot afford to pay anywhere near international rates. As a result, the price received by software houses on domestic sales is considerably lower than what they receive on exports.

Fourth, the software sector itself is weak in many respects. A dominant characteristic of this sector is that it has grown not through consolidation, but through fission. As a result, there is neither size nor specialisation. Further, because of the relatively small size of the average software house in India, there is a lack of standards and inadequate use of software engineering tools, which affects the perceived quality of the product and thereby leads to an unwillingness to pay premium prices by the customers. To make matters worse, strategic alliances and networking between Indian software companies to leverage their respective strengths is completely lacking.¹⁶

There is an interesting, and very damaging, side-effect to this lack of intra-industry alliances. It has been noticed that most Indian software companies claim to be able to carry out virtually any software development work. In an international market which is very aware

of the importance of specialisation and core competencies, such claims are not only treated with scepticism, but in fact lead to a lack of credibility in and negative perception of the entire industry. The long-run damage of such loss of credibility can be immense.

Fifth, there is also a problem that arises out of the exposure that the average Indian has to international conditions. Certain types of software activities, such as telecommunications, transaction automation, smart cards, etc. are simply not addressed since the Indian software developer has not been exposed to these in any meaningful way. On the other hand, activities such as user interfaces are culturally specific, and no meaningful developments can take place until the Indian developer is fully sensitised to such issues. This kind of exposure does not come about spontaneously. Either there has to be an extended period over which software professionals need to live in the target countries,¹⁷ or such applications should be introduced in India with the minimum of time-lag.

The long and short of it is that the Indian software sector faced and continues to face formidable hurdles in doing business, and considerable credit has to go to it for having achieved what it has. More importantly, it should be clear that although some of the problems are internal to the industry, most are outside its sphere of control.

III The Prescription

Having defined the nature of the problems being encountered by the software industry in India, the issue remains as to how to take this sector out of its linear trend and place it on an exponential growth path. Clearly, the strategy will have to encompass both the numbers and the productivity issues. A few suggestions arising from the discussion given above may be made:

(1) The need to reorient and galvanise the educational system cannot be overstated. Efforts like the department of electronics accreditation scheme (DOE-ACC) for introducing minimum standards to private software training institutes, or the project IMPACT of the DOE for strengthening the electronics curricula in the leading engineering institutions, only address the problem at the margin. More fundamental changes are called for. It is suggested that a crash programme in computer literacy and software methodologies be introduced at the college level. Ideally, the curriculum of various disciplines such as commerce, economics, sociology, and of course the hard sciences, should be changed to give greater focus to generating modelling and algorithm development skills. This would probably be much more efficient than expanding the engineering colleges.

(2) The expansion in the international high-speed datacom facilities that has been brought about and catalysed by the department of electronics (DOE) through the satellite earthstations of the software technology park (India) (STPI) and the 'time division multiple access' (TDMA) radio-links of Satcomm (India), is only a drop in the ocean.¹⁸ This trend needs to be carried forward much further. The DOE facilities are limited by the licences that have been granted by the department of telecommunications (DOT), which restrict their operation to particular geographic areas and to specific types of customers.¹⁹ The bulk of the expansion will, therefore, necessarily have to be carried out by the DOT/VSNL, which bear the principal responsibility for telecommunications in India.

While planning for the expansion of the high-speed datacom network, it should be remembered that software exporters are not the only users of such links. Almost all commercial agencies which have international transactions require such facilities.²⁰ Therefore, the minimum necessary expansion of the facilities will have to be orders of magnitude larger than the specific requirements of the software export sector. Unless this is done consciously and expeditiously, the infrastructure will get rapidly overloaded and software companies will be forced to go back to on-site work as the principal vehicle of software exports.²¹

(3) International connectivity apart, the general development of the telecommunications infrastructure in the country is of the highest importance, particularly with regard to intra-country networks. The role of domestic high-speed connectivity in providing a low-cost training ground for telecom-based software development methodologies and in leveraging the hardware base has already been mentioned. There is a further dimension. The real benefits from computerisation are realised fully only when computers get networked. This is the international experience. Therefore, if intra-country connectivity of reasonable cost and quality is made available, the spread of information technology is bound to go up substantially in India.²² This will create a domestic demand base for software, and enable Indian software companies to establish their credibility and track-record for addressing the international markets.

(4) The importance of enabling Indian software companies to establish track-records needs to be re-emphasised. This is one of the major stumbling-blocks in entering the international markets. In this regard the government has an important role to play. It so happens that at present the government is the single largest consumer of software in the country, but it actually takes very little from the commercial software sector. This may make short-run financial sense, but the country loses out on the positive externalities

that are possible. The government should therefore start contracting out its software requirements to commercial developers rather than trying to do it all inhouse.

(5) In addition, the government needs to provide direction to the organisations under its control. In particular, certain public sector undertakings (PSUs) which have strong software capabilities need to be encouraged to hive these off as stand-alone subsidiaries. Fortunately, this is already happening to some extent, even without government intervention. But more needs to be done. Once PSUs start this trend, it is hoped that the private sector companies which have similar capabilities will follow suit.²³

(6) The STPs were established *inter alia* to encourage synergy between small software companies and to provide common marketing facilities. This has not taken place to any great extent yet, primarily due to the existing preoccupation with providing the basic infrastructural facilities to the software companies coming under their charge. In the long-run, however, this is probably the most important function that the STPs can perform given the fissiparous and antagonistic tendencies of the Indian software companies. It needs to be carried forward vigorously. (7) Given the large number of software companies in India and their tendency to claim expertise in practically all types of software, there is a need to establish a mechanism by which a potential customer can get unbiased expert advice about the capabilities of the various contending suppliers.²⁴ Ideally this role should have been played by the concerned industry association, which has apparently abrogated its responsibility. As an initial effort in this direction, the DOE has established the Software Services Support and Education Centre (SSE). Among the various services that this centre is supposed to provide, capability appraisal and advice is one of the most important. For this activity to be successful, however, co-operation of the industry is essential. Whether this co-operation will be forthcoming, or will require a certain degree of government coercion, remains to be seen.

(8) Finally, in order to overcome the effects of exposure and cultural dysjunction, every effort needs to be made to introduce the latest software technologies and applications in India. This too will not happen spontaneously. Deliberate efforts will have to be made. The DOE has recently sponsored a Centre for the Diffusion of Information Technology (C-DIT), which is meant to focus on these issues. Until this process is fully under way, however, on-site software development and body-shopping will remain the principal vehicles for acculturation of Indian software professionals, and it should be taken that unnecessary hurdles are not placed in the way of these activities.

Notes

This paper reflects the personal views of the author, and not those of the government of India.]

† Implying an average annual growth rate of above 46 per cent.

2 These figures have been projected in a study 'India's Software and Services Export Potential and Strategies' prepared by Maxi/Micro Inc for the department of electronics, government of India in 1992.

3 Let: Pd = domestic price (ex-factory price)
Pe = export price (invoice value)

md = profit margin on domestic sales

mc = profit margin on exports

t = transport cost in export price

Then it can be shown that the 'calculated' export profit is greater than the actual (mc) if:

$$\frac{md}{Pd} > \frac{mc}{(Pe - t)}$$

4 Reasons for export profits being higher than those on domestic sales are enumerated later in this paper.

5 Technically and conceptually there is nothing wrong in this definition, providing that some segregation is made for the marketing component of such expenditures and corresponding adjustments are made for domestic sales also. But neither are done.

6 There is in fact a real conceptual difference between 'on-site development' and 'body-shopping' which seems to have been totally missed by the Indian critics. The former refers to sending software developers to work at the client's premises by an Indian company for a specific job, whereas the latter implies that individual software professionals are found for employment by foreign companies.

7 This was despite the fact that the 1986 Software Policy clearly identified 'on-site services' as an integral and important part of software activities.

8 It may be noted that the growth rates have been computed as compound annual rates on a point-to-point basis. The "total" growth rate is defined as the growth in rupee terms, whereas the "real" is in terms of the dollar values. The

exchange rate effect captures the residual and therefore includes not only the pure exchange rate effect, but also the interactive term

9 The quadratic trend equations uniformly performed less well than the linear and the exponential, and hence have not been reported.

10 It is interesting to note that the projection based on the log-linear equation (US \$ 630 million) is almost the same as that projected by the study cited in note 3 (US \$ 640 million) as the base-line or 'business as usual' scenario. This should come as no surprise, since the latter was based on a forced compound growth process. What is important in this context is that the projection calculated in this paper requires substantial changes which would move the industry permanently on an exponential trajectory. This is by no means a 'business as usual' outcome.

11 Productivity enhancement tools in software development are a case in point, but these have come into popular use only recently and therefore have not yet had a substantial impact.

12 The beneficiaries from this lacuna have been countries like Jamaica, Philippines, Israel and even Ireland, which today dominate this activity. China too is starting to make headway in this direction.

13 The other reason being the need to establish a credible track record, which could probably not be done in any other way. This factor, however, should have diminished over time.

14 The introduction of Section 80-HHE of the Income Tax Act probably has contributed to showing higher gross export values for reasons discussed earlier in this paper.

15 In the initial years, many software companies in fact had to draw upon large numbers of non-engineering graduates for their workforce, primarily because engineering graduates had more attractive options. Unfortunately in most cases a considerable amount of training had to be given, which raised the costs to the company quite substantially. Even today, small and start-up companies, which cannot offer emoluments at par with the larger companies, have to rely on such recruits.

16 This sort of networking has become commonplace in the garments industry, which is also characterised by small firms. The lack of networking among software firms has sometimes been put down to ego problems of the technocrat-entrepreneurs in this sector.

17 This carries the attendant risk of the individual not returning to India, i.e., "brain-drain".

18 On paper, the department of telecommunications (DOT) and the Videsh Sanchar Nigam (VSNL) have been prepared to offer high-speed datacom links for many years. However, until as late as 1990, only three channels of 64 Kbps band-width had actually been provided by these agencies in the whole country. One of the primary reasons for this pathetically low level of connections was the high rates that were being charged. At that time, a 64 Kbps link from Delhi would cost about Rs 35 lakh (approximately US \$ 1,80,000) per annum for the half-circuit, as compared to the international rate of about US \$ 84,000 per annum. The other reason was the unsuitability of much of the DOT network for wide band-width data-grade traffic and the distinct unwillingness of the DOT to upgrade the circuits on a priority basis.

With the advent of the STPI earth stations and the use of radio links to solve the 'last mile' problem, the DOE was able to provide reliable high-speed datacom links at relatively low rates like Rs 14.5 lakh (US \$ 60,500) per annum for 64 kbps. In response to this initiative, datacom charges were brought down dramatically by DOT/VSNL to Rs 16.5 lakh (about US \$ 68,000). In addition, the attitude of these agencies towards datacom become more positive, albeit only marginally. As a consequence, the number of 64 Kbps links today has gone up dramatically to more than 200, of which about 90 are from the DOE-sponsored agencies.

19 At present the DOE facilities cover only eight cities (Delhi, Bombay, Madras, Bangalore, Hyderabad, Thiruvananthapuram, Bhubaneswar and Gandhinagar). In addition, the licences restrict provision of the service only to 100 per cent export-oriented software units operating out of the EOU, EPZ or the STP schemes. The bulk of Indian software exports, however, are from DTA units, usually operating under the Export Promotion Capital Goods (EPCG) scheme. These perforce have to rely on DOT/VSNL.

20 In fact the garments and textiles industries, along with financial institutions, are some of the heaviest users of high-speed datacom internationally.

21 It is expected that as the Indian economy liberalises further, many industrial and services sectors will be forced to adopt information technology tools for competing effectively. This will place considerable demands on the telecom infrastructure.

22 The DOT does provide some very limited domestic networking through its I-Net and RABMN networks. It has also recently permitted private sector participation in such activities. However, most of these networks are of relatively low speed and are suitable only for non-real time applications such as e-mail, and not for high-speed applications.

23 Steel Authority of India (SAIL) and Hindustan Aeronautics (HAL), two major PSUs, have set up subsidiaries for software development, particularly for export. Some leading private companies are also in the process of doing the same.

24 This would be a software industry equivalent of the credit rating agencies such as CRISIL and ICRA.

Public, Joint and Private Sectors in Indian Industry

Evaluating Relative Performance Differences

Sumit K Majumdar

In this paper the author evaluates relative performance differences between the government-owned, joint sector and private sectors of Indian industry. Comparative efficiency parameters are estimated for the period 1973-74 to 1988-89 using data generated by the Annual Survey of Industries (ASI) which relate to the organised sector of manufacturing industry. The results establish that, in aggregate, enterprises owned by the central government and the governments of various states in India, while accounting for a major chunk of capital investment, are systematically only two-thirds as efficient as private sector enterprises, while joint sector enterprises are also less efficient than those in the private sector.

Results of the data analyses reveal that the assumptions of economic theory, positing higher efficiency levels for the private sector, cannot be disproved in the Indian context, and the results also contradict extant evidence which have found no performance differences between government-owned and private firms in India. The paper also discusses certain features unique to the political environment of India as a result of which the noted efficiency differences arise. However, the data also show that reforms that have been put in place in the 1980s towards improving government-owned enterprise performance have had a systematic and significant impact in leading to inter-temporal efficiency gains, particularly in enterprises owned by the central government.

I

Introduction

STATEMENTS of disquiet about the performance of the government-owned sector of Indian industry are common-place, and major concerns have been expressed both by writers who have been senior policy-makers [Bhoothalingam 1993; Jalan 1991; Marathe 1989] and by academics [Bardhan 1984; Bhagwati 1993]. Yet, the extant comparative evidence that exists [Bhaya 1990; Jha and Sahni 1992; Ramaswamy and Renforth 1994] points to no significant differences in the performance of private versus state-owned firms. What is the true picture? The demise of command-style economies is already being attributed to behavioural issues that arise when government is the primary owner of enterprises [Roemer 1993]. Based on this premise, major reforms are taking place in most erstwhile command economies, and there is an explicit acknowledgement that private ownership will yield greater efficiencies and breed industrial success. If the Indian government-owned sector is, indeed, as efficient as the private sector, then the large amount of effort being currently devoted to privatisation and reforms is of no avail, since the efficiency gains are unlikely to be material. Conversely, the authors noted above may have substantive reasons for expressions of their disquiet, and contemporary empirical research could well be flawed. The resolution of such an important conundrum, then, has to be based on facts and evidence, and this paper reports the results of a study evaluating comparative efficiency patterns among segments of Indian

industry owned by different categories of investors.

In India contributors to the equity capital of enterprises include the central government, governments of the various states in the Indian union, private investors and governments jointly, and private investors alone. The primary way to distinguish between ownership categories is to classify them as the state-owned (public) and the private sectors. The term state-owned is used in the Indian context to include enterprises owned both by the central government and by the governments of the various states that form part of the Indian union. The latter are called state government-owned enterprises. In subsequent empirical analysis, central government-owned and state government-owned enterprises' data are separated for efficiency estimation purposes. Though the term enterprises is used throughout the paper, analysis is carried out using aggregate data, as described in a later section of the paper.

Comparative efficiency assessment is also important for another reason. Research shows that the evolution of modern industry, the capabilities developed within industry, and the efficiency with which these capabilities have been utilised have been a major force in shaping the growth and economic strength of modern nations [Chandler 1993]. The state-owned sector accounts for a substantial part of employment and capital investment in many developed as well as developing nations. Therefore, understanding whether the state-owned sector performs better or worse than private enterprises, in circumstances where the state-owned sector is a major player in the industrial arena, is

relevant in shedding light on whether national progress is being propelled forward, being sustained or impeded.

It is argued that the comparative assessment of state-owned enterprises with other types of enterprises is not feasible because profitability review of state-owned enterprises ignores the socio-economic objectives associated with state-owned enterprises [Bhaya 1990]. Yet, for a fundamental reason, comparative efficiency analysis matters. Industrial progress is determined not only by the rate of expansion of resources employed, but by the way resources have been utilised and efficiency in resource utilisation is well-acknowledged to be more critical to economic welfare than allocative efficiencies.

The Indian experience with the state-owned sector provides a rich backdrop for assessing comparative efficiency. In terms of magnitude, the state-owned sector constitutes a large proportion of industrial activity, and for the first four decades since independence the Indian economy has seen an ever increasing role played by state-owned enterprises. Jalan (1991) notes that the total investments in Indian central government owned enterprises was Rs 1,82,000 crore in 1990, made up as fixed capital Rs 82,000 crore, working capital, Rs 76,000 crore and sundry investments, Rs 11,000 crore and the deficit financed by the owners, the government of India, Rs 13,000 crore. The figures excluded the assets of enterprises in the banking and insurance sectors, as well as those of departmental undertakings such as railways, posts and a large portion of the telecommunications network.

Table I gives an indication of the increasing role of the state-owned sector in India's economy. It shows the composition of employment, productive capital (including fixed and working capital) and value added between the state-owned sector (owned by the central government and various state governments), the joint sector and the private sector for six recent time-periods: 1973-74, 1976-77, 1979-80, 1982-83, 1985-86 and 1988-89.

With respect to employment, the share of the state-owned and the joint sectors has risen, in total, from 27 per cent in 1973-74 to 37 per cent in 1988-89. With respect to productive capital invested, the share of the state-owned and joint sectors was over half, at 58 per cent, in 1973-74. By 1979-80, this share had risen to 68 per cent. Though fluctuations have occurred, in 1988-89 the share remained at 66 per cent, implying that two-thirds of the capital invested in Indian industry is owned by the state-owned and joint sectors. Marathe (1989) also notes how there were less than five central government-owned enterprises in 1950-51. Ten years later there were 48. By 1971-72 there were over a 100 such enterprises and by 1980-81 the number has increased to 187. Currently, there are almost 250 such enterprises.

The paper evolves as follows. In Section II theory and evidence with respect to performance assessment are discussed. Thereafter, in Section III the empirical analyses are described. Data and estimation issues connected with the paper are discussed. The analysis is based on a comparison of efficiency patterns for 16 time-periods between 1973-74 and 1988-89, which is the last year for which data have been released by the Central Statistical Organisation of the government of India, for four sectors of Indian industry in respect of which data have been reported by ownership type. These are: the central government-owned sector; the state government-owned sector; the joint sector; and the private sector. Data are collected for factories belonging to firms in each of these sectors, and the factory-level data are aggregated for reporting purposes annually. The data-reporting and collection is carried out under the framework of the Indian Collection of Statistics Act of 1953 by the Department of Statistics in the Ministry of Planning. Section IV discusses the results that are obtained from the empirical analyses, and Section V concludes the paper.

II

Theory

Arguments advanced for the existence of performance differences between private and government-owned enterprises are as follows. To the extent that ownership composition varies, principal-agent issues arise [Putterman 1993]. Property-rights, which are rights over the enjoyment and

disposal of assets, are attenuated in government-owned enterprises because a market for corporate control is absent. Capitalisation of the future consequences of undertaking specific activities into current share prices is inhibited because there is no public trading of government company shares, leading to a reduction in owners' incentives to monitor managers, and the exit option that can be exercised where there is a market for corporate control is, therefore, not viable. Consequently, there is a lack of capital market discipline to which state-owned enterprise agent-managers can be subjected to by owner-principals.

Next, an issue arises with respect to the fuzziness of owners' identity. With many owner-principals there are incentives to free-ride because any owner bearing the costs of monitoring has to share them with others [Ben-Ner, Montias and Neuberger 1993]. The ownership of state-owned enterprises is vested in individual government ministries and departments, which in the case is the owner on behalf of the Indian union headed by the president of India. Theoretically, therefore, this attribute ought to ensure superior performance, compared to the private sector, since ownership is not diffused among many owners but there is only one owner who can exercise strong control. However, the government department is, itself, an agency for citizens who are the *de jure* owners of state-owned enterprises. This means that the control of government-owned enterprises, being undertaken by civil servants, is vested in persons who are themselves agents monitoring other agents, and have no incentives for carrying out their tasks.

The consequences are as follows. As a collection of many principals, citizens face severe agency problems, and in a democracy neither have the incentives, nor can they find it easy to control state-owned industrial enterprise managers. Individually they cannot arrange a private portfolio of state-funded enterprises, to internalise the benefits of information acquired from having undertaken monitoring activities. Then, the very diffuseness of public ownership implies that citizens acting individually have small probabilities in influencing outcomes or expressing voice. As a result, state-owned enterprises effectively become proprietary organisations owned *de facto* by civil servants or politicians, while managers in such

organisations know that they are free of both market discipline or sanctions from the ultimate principals.

With respect to the issue of public versus private sector performance, Vickers and Yarrow (1988) have argued that it is primarily variations in the nature of competitive regimes faced that determine performance differentials between privately- and publicly-owned firms. The argument is that forces of competition have a direct impact on the cash-flows of enterprises. Given equally competitive conditions, private and public sector firms face similar potential to lose or make money. Since private sector managerial rent-seeking, capitalistic behaviour or the exploitation of public sector firms' profits for private political gains are going to be possible only when there are adequate cash-flows, the greater the threat that forces of competition will lead to the dissipation of such potential rents, the better firms' performance is likely to be and competition is supposed to be the great leveller of performance between private and public firms.

III

Evidence

There is some evidence which finds that public and private firms facing similar competitive environments do not display any efficiency differences [Caves and

TABLE 2: EFFICIENCY SCORES FOR FOUR SECTORS OF INDIAN INDUSTRY, 1973-74 TO 1988-89

	Central Government Sector	State Government Sector	Joint Sector	Private Sector

1988-89	.61	.39	.34	.66

Christiansen 1980], or that given sufficient competition between private and public producers, and no discriminating regulations, unit cost differences are insignificant [Borchering, Pommerehne and Schneider 1982]. The competitive forces approach also explicitly assumes the absence of soft-budget constraints, which as Jalan (1991) has argued leads to attempts to keep public enterprises for which euthanasia is the only solution operating with a variety of life-support systems. Hence, in spite of similarities in competitive conditions, the composition of the specific institutional environments that private sector or public sector firms are faced with may affect performance.

For example, there is the reality of the political environment surrounding government-owned enterprises. While citizens may have little say in the functioning of government-owned firms, government decision-making is surrounded by a constellation of interests forming specialised coalitions interested in government-enterprise operations. These actors include politicians, unions, trade associations and consumer groups who can pressurise bureaucrats into directing government-owned bodies into acting in manners consistent with their own special interests. While the distributional consequences of such pulls and pressures may often be positive, their impact on efficiency is likely to be negative because such factors do tend to make the management process in government-owned enterprises complex and unfocused.

There is a large empirical literature evaluating the relative performance of the public versus the private sector. Boardman and Vining (1989) evaluate 54 studies, of which six find the public sector to be more efficient, 16 find no performance differences between the two sectors, while 32 find that the private sector is more efficient. Many of these studies have compared firms undertaking specific activities, such as running airlines, supplying water or supplying refuse collection services. However, comparatively few studies have compared efficiency patterns among different ownership segments of the industrial sector as a whole for a specific country.

There are some exceptions. Boardman and Vining (1989), in a comprehensive study, evaluate the performance of 500 of the world's largest corporations outside the US for the year 1983. The companies they evaluate operate in the mining and manufacturing sectors, and belong to several nationalities. They find that, controlling for a variety of factors, joint and state-owned enterprises perform worse than similar private enterprises. In terms of their key performance indicators, joint enterprises are no different from state-owned enterprises, but relatively worse performers compared to the private sector firms.

With respect to India, three studies exist. These have used a variety of methodologies, data and performance benchmarks. Bhaya (1990) uses Annual Survey of Industries (ASI) data for the years 1981-82 to 1985-86. Calculating simple ratios of net value added to fixed capital, working capital and inventory, but ignoring human capital utilisation, he believes it is safe to conclude that public sector management efficiency is in no way inferior to that of the private sector, but the sector does perform worse with respect to its return on investment.

Jha and Sahni (1992) use ASI data for the years 1960-61 to 1982-83 for four industries: cement, cotton textiles, electricity and iron and steel. The latter two industries, they claim, are primarily in the public sector, while the first two are owned predominantly by private interests. The authors find no evidence of allocative inefficiencies in general, and each of them are relatively as efficient as one another. Ramaswamy and Renforth (1994) use 1988-89 to 1992-93 accounting data for a non-randomly chosen and matched sample of 55 firms each from the private and public sectors. Using the same measures as Bhaya (1990), they conclude that managerial efficiency differences do not exist between the two sectors, though public sector firms are again found to be less profitable.

These studies contradict theory and belief with respect to public sector performance in the Indian context. However, each study suffers from biases which call their results

into question. Bhaya (1990) uses very simplistic techniques, a very narrow time window, and eye-balling procedures as analytical methodology to reach his conclusions. Jha and Sahni (1992) are more rigorous in their empirical approach, but unfortunately restrict their study to four sectors only. They also evaluate allocative efficiency, and no conclusions with respect to technical or managerial or technical efficiency can be made based on their study. Ramaswamy and Renforth (1994) also have a narrow time-window, their study suffers from the same methodological shortcomings as the one by Bhaya (1990), and also from maximum sample-selection bias. They non-randomly choose 55 firms each from the total population of firms comprising the private and public sectors, and, given the wide heterogeneity of private sector firms in India, it is easy to choose a number of private sector firms which are similar to their public sector counterparts in efficiency characteristics.

IV Empirical Analyses

DATA AND CONTEXT

To calculate comparative efficiency patterns over the period 1973-74 to 1988-89, data generated by the Annual Survey of Industries (ASI) in India are used. The ASI data relate to the organised sector of manufacturing industry and have seen prior

the [Ahluwalia 1991]. The factory sector summary is used as the data-source for this study. From the data set, labour and capital inputs as well as output measures can be identified.

The advantage of using this data is that information for the entire Indian industry is available. This includes information on firms owned by the governments of the various states in the Indian union which are also substantial players in the industrial arena, and whose performance has never been empirically analysed. The characteristic of this particular data-base is that data are aggregate because of the reporting policies of the department of statistics of the government of India. However, the aggregation issue is unavoidable since information on a key variable, that of firm-level employment, is just not available for private sector firms. Hence, any comparative study of efficiency has to use a data-base such as this. Aggregate data also helps avoid any sample-selection biases, since data on the entire industrial population is considered for comparative efficiency assessment purposes.

Since 1956, every conceivable sub-sector of Indian industry has seen their presence. Apart from defence firms, traditionally in the public domain, generation of atomic and non-atomic power, manufacture of aircraft, heavy machinery, and equipment for rail and sea transport are among activities carried out exclusively by state-owned firms. At present, state-owned firms also manufacture products such as aluminium and non-ferrous metals, chemical intermediates, iron and steel, drugs and fertilisers, and are involved in diverse activities such as construction, engineering consultancy, farming, handicrafts retailing, shipping, coal mining, oil refining, commodity trading, and software consultancy. State-owned firms operate in many consumer-goods industries such as condoms, hotels, handicraft retailing, food products, televisions and consumer electronics where competition among players is very high, and in general are subject to the same institutional and regulatory forces that private firms have to face with regard to day-to-day operations. Data for firms undertaking these activities are included within the data that are analysed.

Three inputs and one output are used in the computation of an efficiency index for each observation. The inputs are rupee values of fixed and working capital, and the actual number of staff employed. The output variable is net value added, expressed in terms of rupees which is a standard measure of firm-level output [Jackson and Palmer 1988]. In the contemporary literature on efficiency measurement both value added and gross output are concomitantly used to measure output. However, Griliches and Ingstad (1971) advance arguments in favour of using value added because it facilitates

comparison of results for firms which may be heterogeneous in material consumption. Second, inclusion of material as an input may lead to the problem that all variation in efficiency may be captured by materials consumption, thus obscuring the role of physical and human capital utilisation.

A further choice arises between the use of either gross or net value added as the output measure. Denison (1974) makes a case for the use of net value added on theoretical grounds by arguing that, since gross value added includes a measure of capital consumption, there is no rationale as to why capital consumption ought to be maximised rather than minimised. Nevertheless, value added captures hybrid aspects of firms' activities, as Diewert (1978) has noted. First, it captures a production relationship between primary factors and output. This relationship is based on managements' capabilities. Second, it also captures a profit-generating relationship between firm-specific capital and firms' output, which, while also dependent on endogenous management capabilities, is highly dependent on exogenous demand and supply conditions, since these conditions determine the prices a firm is able to charge for its outputs. In the context of state-owned firms in developing countries, administered price regimes may be in operation, and governments use state-owned firms to operate as indirect tax collectors [Reddy 1990]. In the case of India, this is particularly true for state-owned oil firms. Thus, there may be

a large element of windfall price-gains captured in the value added measure for each firm.

To create value necessitates acquisition and configuration of capabilities, which are encapsulated in physical, liquid and human capital. Capital inputs, both physical and working capital, are also expressed in crores of rupees. Human capital inputs are expressed in thousands of employees. To deflate variables expressed in rupees the wholesale price index is used; the capital inputs and the output values are then expressed in constant rupees.

Capital inputs can be book-values of physical capital given in ASI data, however, in measuring capital input, the use of undeflated amounts lead to inaccuracies. The book value series is deflated by price index. The weakness of the approach is that it does not take into account assets of different vintage bought at different points of time. Conversely, major lacunae of the perpetual inventory method, which can take into account the different-vintage issue, are the two key arbitrary assumptions, for some base year of an amount as beginning capital stock, and an annual rate of capital consumption. Therefore, efficiency parameters obtained by different researchers can vary amongst themselves, because each researcher may choose to base analysis on idiosyncratic assumptions as to the base capital values and rate of capital consumption.

The ASI data reported by individual enterprises are collected at the factory level.

Joint sector			2.52 (0.01)

Note: The test compares whether the row efficiency score is significantly less than the column efficiency score. The upper number in each cell is the Wilcoxon test *z* value. The lower number, in parentheses, is the *p* value.

For public reporting purposes, data classified by ownership category are released only in aggregate. Thus, for every year there are four observations with respect to output and inputs, given the existence of four ownership categories. However, time-series observations for each ownership category are available for each year between the period 1973-74 to 1988-89; thus, for each category there are 16 available observations. Pooling data by ownership category and time yields 64 observations to be used for comparative efficiency assessment. The ASI coverage and almost two decades of time-series data yields rich information on the entire population of enterprises that make up the organised industrial sector of India. The ASI has been carried out since 1959, and is the principal source of industrial statistics in India. The ASI extends to every part of the country, except some industrially-marginal states, and covers all factories registered under the Indian Factories Act of 1948. Essentially, all factories employing more than 10 workers and using power, or more than 20 workers and not using power have to report data. However, the ASI was not carried out for 1972-73, and data prior to that year is not available in collated form by ownership category.

The analyses involve calculating and comparing efficiency for the 16 years between 1973-74 and 1988-89. For each year and each ownership category an efficiency score is calculated, and to statistically assess performance differences between various ownership categories, the scores for each category are averaged for the 16-year period. Second, an issue is, have there been efficiency gains over time? Fundamental economic liberalisation started in India in 1991. However, there were two spells of liberalisation, one starting after 1980 when the prime minister Indira Gandhi commenced reforms, which her successor Rajiv Gandhi continued from 1985 onwards [Ahluwalia 1991; Bhagwati 1993]. To test whether these had any impact, the growth rates in efficiency scores obtained for each ownership category are calculated.

EFFICIENCY ESTIMATION

Data envelopment analysis (DEA) is used to calculate firm-level efficiency and measure slack in the utilisation of various resources. Charnes, Cooper and Rhodes (1978) (CCR) develop, and Banker, Charnes and Cooper (1984) (BCC) extend, the efficiency measure developed by Farrell (1957) using a fractional mathematical programme, where the ratio of weighted outputs to weighted inputs of each observation in the data-set is maximised. This approach proceeds by constructing efficiency scores for a number of obser-

vations. For each observation a single efficiency statistic, which is a ratio measure of performance as to how efficient each observation is in converting a set of inputs jointly and simultaneously into a set of outputs, is calculated.

There is now a large literature on DEA. See Majumdar (1994) for operational details and application in the Indian context, and Seiford and Thrall (1990) for technical details of efficiency estimation using DEA and exposition of details of the various models possible within the DEA framework. In extending the original model developed by Charnes, Cooper and Rhodes (1978) (CCR, Banker, Charnes and Cooper (1984) (BCC) show that the CCR efficiency score can be broken up into measures of scale and pure technical efficiency. This is achieved by assuming that variable returns to scale exist for firms and by adding a variable in the LP so that hyperplanes for each observation do not pass through the origin, unlike in the CCR model where all hyperplanes go through the origin because constant returns to scale are assumed. In the constraint set for the linear programming model, this variable is kept unconstrained in that it can take on values which are either negative (increasing returns to scale exist), or 0 (constant returns to scale exist) or positive (decreasing returns to scale exist) for each observation.

In empirical analysis using DEA each firm that is rated as efficient is used to define an efficiency frontier, and firms not so efficient are evaluated by comparison with hypothetical firm that is on the frontier, and which has the same output or input mix as the firm being compared. Then, the efficiency of the firm being compared is the ratio of the actual output levels to that of the hypothetical firm. For purposes of analysing managerial performance, the output of a DEA programme provides a key

aid. The relative efficiency measure gives an indication of how well each firm is performing relative to its potential. Since the best firms have to score 1, on a scale of 0 to 1, the difference in scores gives management policy-makers an idea of the scope of improvement possible.

Within the DEA model two behavioural approaches can be factored in. A first assumption is that each firm conserves inputs; then, the algorithm evaluates minimal use of various inputs, with outputs generated kept constant. This is the input-conserving orientation. A second assumption is that each firm augments outputs; given a finite stock of inputs available, the firm seeks to maximise outputs that can be generated with these. The DEA procedure takes each observation's idiosyncracies into account in the computation of its relative efficiency score. The weights that are used for each observation are implicit internal valuation schemes which are empirically determined by the algorithm, and varies from observation to observation. This is based on a determination of which of the inputs a particular observation is particularly adept at in utilising, or which of the outputs it is particularly adept at in generating, based on data. By assigning high weights to those inputs and output variables which an observation seems to be more adept at in utilising, or in generating, and low weights to others, the algorithm attempts to maximise the observed performance of each observation in light of its particular revealed capabilities.

To compute efficiencies and slack in resource usage, the BCC algorithm is used. One key output - value of gross output, is used. A better measure of output in efficiency studies is net value added. However, the objective of this empirical exercise is to specifically evaluate excesses in input utilisation and shortfalls in output genera-

TABLE 7. SECTORAL PERCENTAGE GROWTH RATES IN EFFICIENCY OVER TIME

	Central Government Sector	State Government Sector	Joint Sector	Private Sector
Overall Period 1973 to 1988				
b (growth rate)	2.00 (2.04)*	3.45 (2.25)*	-0.10 (0.21)	0.47 (2.41)*
c (acceleration trend)	1.20 (4.97)*	0.29 (0.80)	0.29 (2.59)*	-0.07 (1.38)
Period 1: 1973 to 1980				
b (growth rate)	-9.10 (2.98)*	-1.67 (0.28)	-4.27 (4.25)*	1.33 (1.70)*
c (acceleration trend)	-0.62 (0.41)	0.96 (0.32)	-0.23 (0.46)	0.12 (0.32)
Period 2: 1981 to 1988				
b (growth rate)	10.78 (3.92)*	3.78 (1.46)	0.72 (0.58)	0.20 (0.63)
c (acceleration trend)	1.49 (1.08)	-1.72 (1.36)	0.02 (0.03)	-0.01 (0.60)

* significant at $p < .10$ at minimum.

Note: Absolute t-statistics in parentheses

tion, rather than measures of relative efficiency. There are a heterogeneous group of firms in the sample, among which the creation of output can be affected by several considerations. However, to generate output necessitates acquisition of firm-level capabilities which are encapsulated in physical capital, working capital and human capital. Therefore, three inputs are used: total fixed assets, working capital and number of employees. Firms which have a trading orientation are likely to have relatively greater working capital and manpower components, compared to manufacturing firms which have a high fixed capital component. These inputs can be combined in idiosyncratically different ways to create output. DEA measures how these input combinations are used by different state-owned units.

EFFICIENCY GROWTH RATES

To calculate efficiency growth rates, an exponential efficiency-time relation is initially specified, as follows:

$$Et = x(1+r)^t \mu t \quad (1)$$

which can be linearised as follows:

$$\ln Et = a + bt + ut \quad (2)$$

where Et = an efficiency ratio generated by the DEA programme for each sector and time-period

t = time in discrete years ($t = 1, \dots, 16$)

$a = \ln x = a \text{ constant}$

r = annual compound growth rate

$b = \ln(1+r)$

$ut = \ln \mu t \sim \text{IND}(0, \sigma^2)$

The exponential form is chosen for the following reason. If progress is assumed to be dynamic, then efficiency in a given year is more likely to be at least a constant percentage of efficiency in the previous year and not a constantly diminishing percentage of it. The coefficient on time, b , is the continuous rate of growth, but given the range of values it closely approximates the annual compound growth rate, and the estimates of b are taken as the growth rates. A basic problem which arises in the fitting of equation (2) to the full time-series data is that the growth rate in a given period can differ from the growth rates of efficiency in the various sub-periods. The estimated growth rates in efficiency in each period can be higher or lower than that of the entire period, depending on the nature of policy regimes in place. Thus, sub-period growth rates in efficiency are estimated for the years: 1973-80 and 1981-88 separately.

The variations in growth rates shown by estimates of equation (1) raises an issue as to whether these rates are constant. Efficiency growth rates can accelerate or decelerate. To incorporate such possibilities and evaluate the rate of change in efficiency for the full period as well as for the two sub-periods, a log-quadratic equation is estimated, as follows:

$$\ln Et = a + bt + ct^2 + ut \quad (3)$$

A significantly positive value of c indicates an acceleration in the growth rate of efficiency; a significantly negative value indicates deceleration.

The inclusion of time squares on the right-hand side in (3) introduces a multicollinearity problem. This is solved by normalising time in mean deviation form. That is, it is set to zero on the mid-point of the time series. This procedure is followed for the full series as well as for each of the two sub-periods. This normalisation makes time and its square orthogonal. The normalisation of time only affects b . The estimate of c and its standard error are invariant with respect to the normalisation. In the log-quadratic estimation, the value of b is the same as in the log-linear model. The standard error of b is the measure of instability of the growth rate of efficiency. If it is assumed that the log-quadratic form is a better estimator of the true trends in the growth rate of efficiency, the instability measure of b is also improved, since systematic specification errors are cleansed from the data.

V

Results

COMPARATIVE EFFICIENCY PATTERNS

The BCC DEA algorithm, which makes no assumptions as to the returns to scale characteristics of the different observations, is used to calculate relative efficiency scores. The detailed scores for each ownership category by each year are given in Table 2. The descriptive statistics of the scores are given in Table 3, and form the basis of the subsequent discussion.

The sectors of Indian industry owned by the central government and the governments of the various Indian states have average efficiency scores of 0.658 and 0.638, on a scale of 0 to 1, respectively, for the period between 1973-74 and 1988-89. Comparatively, the sector of Indian industry owned jointly by a combination of government and private owners has a score of 0.912. The privately-owned segment of Indian industry has a score of 0.975 for the same period. It is reiterated that these are comparative scores only. If data for later years are used, the resultant average scores may very well change. If a sector, say the joint enterprise sector, is dropped from the computations, again the relative scores may very well change.

Prima facie, the results reveal that government-owned firms are less efficient than firms in the joint or the private sector. The data also reveal that in the Indian context joint sector firms are more efficient than government-owned firms, but less efficient than those in the private sector, while the private sector is comparatively the most

efficient sector of Indian industry. The variation in the patterns of DEA-derived scores are also of interest. The central and state government sectors have considerably higher variation in their efficiency scores as compared to the joint and private sectors. The standard deviation (coefficient of variation) of the scores are 0.171 (0.260) and 0.176 (0.275) respectively, compared to standard deviations (and coefficients of variations) of 0.086 (0.094) and 0.039 (0.045) for the joint and private sectors.

Data on the maximum, 75th percentile, median, 25th percentile and minimum scores are given, and the range and the inter-quartile deviations for the four sectors reveal the existence of considerable variation in the scores for the central and state governments-owned portions of Indian industry. While the joint sector scores do not vary as much as those for the government sectors, they do vary more than the scores for the private sectors. The data shows that the range and inter-quartile deviation of the score for the joint sector, at 0.269 and 0.120 respectively, are higher than those of the private sector which are 0.134 and 0.044.

The greater variation noted in the scores for the government-owned sectors has a key implication. While the average efficiency of the government-owned sector is lower than that of the joint or private sectors, the scores have fluctuated considerably, suggesting that performance of state-owned enterprises has been relatively volatile. A glance at Table 3 reveals that the efficiency scores for the central government-owned sector was around the 0.5 mark during much of the 70s and early 80s, but rose considerably after 1985-86. It is feasible that after the installation of Rajiv Gandhi's government in late 1984 the liberalisation that was undertaken had some impact, and this shows up in the higher scores for the last four years in the present data-set. Comparatively, the portion of Indian industry owned by the state governments, *prima facie*, shows no discernible pattern in its efficiency scores for the 16 years studied.

Table 4 presents the results of a statistical test carried out to evaluate whether the average efficiency score for each ownership category differ significantly from each other. The non-parametric procedure carried out is the one suggested by Wilcoxon (1945).

As shown in Table 4, statistically there is no difference between the efficiency of central government-owned sector and that part of Indian industry owned by the various state governments, and the Wilcoxon z statistic comparing differences in average scores is almost negligible (with a p value almost unity at 0.96). The central government-owned sector is statistically highly inefficient than both the joint sector and the private sector (with the associated p values being 0.00). Similarly, the sector owned by the state governments is also statistically

less efficient than either the joint or the private sectors (again *p* values are 0.000). Finally, the joint sector is also significantly less efficient than the private sector. However, while the efficiency difference is statistically significant, the significance is not as strong (the *p* value is 0.02) as it was with respect to efficiency differences between the central or state-government-owned sectors and the joint or private sectors.

It has been remarked that in the post-1980 period industrial reforms started taking place in India. Differences in scores for each ownership category are separately tested for the years 1973 to 1980 and 1981 to 1988 respectively to identify if the pattern of differences noted for the overall period stay the same in two sub-periods, one of which is pre-reforms and the other post-reforms. The results are given in Table 5 and 6.

The test results establish that for both periods, 1973 to 1980 and 1981 to 1988, the private sector is more efficient than any other sector. The joint sector is more efficient than the government-owned sectors, while being less efficient than the private sector. The government-owned sectors are made up of the central government-owned and state government-owned enterprises, and between themselves there are no performance differences in either of the two sub-periods.

EFFICIENCY GROWTH RATES

The results point out that the private sector is more efficient in the Indian context, for the period studied as a whole as well for two sub-periods. Growth rates estimation help establish whether there is timewise increase in sectoral efficiency patterns. Estimates are in Table 7. In the period 1973 to 1988, central government enterprises' efficiency has grown at the rate of 2 per cent and the efficiency of those owned by state-governments at 3.45 per cent per annum, respectively. Both trends are significant; however, an accelerative pattern is noted for the central government-owned sector. Joint sector efficiency has not risen or fallen significantly, while that of the private sector has grown at a rate of 0.47 per cent per annum, a trend which is significant. A review of the results for the two separate time-periods reveals interesting dynamics at work. For the period 1973 to 1980, efficiency declined at the rate of 9.1 per cent per annum, 1.67 per cent per annum and 4.27 per cent per annum for the central government-owned, state governments-owned and joint-sector enterprises, the trends being significant for the central government-owned and the joint sectors. Private sector efficiency rose at the rate of 1.33 per cent per annum. Between 1981 and 1988, central and state-government-owned enterprises' efficiency rose at the rate of 10.78 and 3.78 per cent per annum respectively, while the joint sector and private

sector efficiency rose at 0.72 and 0.20 per cent per annum respectively.

There are several reasons for the rising trends in the efficiency of the central government-owned sector. From the early 1980s, several industrial-sector reforms were commenced, and the public sector was made the target of policy-makers' attention. In the mid-1980s, a committee headed by Arjun Sengupta, now member-secretary of the Planning Commission and then economic adviser in the prime minister's office, recommended several far-reaching changes in public sector management and control practices. These were being implemented, albeit slowly, over the latter part of the 1980s and the improvements in efficiency bear out that they have had some impact in making the public sector more efficient than it had been, relative to its own base.

VI

Discussion of Results

The state-owned and the joint sectors account for two-thirds of contemporary capital investment in India, but are significantly inefficient compared to the private sector. If there has been a retrogression in India's industrial capabilities up to the 1980s, as authors (Ahluwalia 1991; Bhagwati 1993) have suggested, then the analyses carried out suggest that the government-owned sector must bear a great deal of the blame. The joint sector, however, is significantly efficient compared to the state-owned sector, and in India is an important player in the industrial arena. The joint sector consists principally of petroleum firms. Their performance helps to redress the situation towards ensuring the efficient use of public resources.

The results obtained have several implications from the point of view of theory. Recollect that the DEA score calculated using the BCC algorithm is a precise measure of efficiency for each observation. In comparison with the private sector, which is almost fully-efficient in a relative sense, because the average score is 0.975 on a scale of 0 to 1, government-owned firms are just about two-thirds as efficient, and these efficiency differences are strongly significant. Ownership does strongly matter in influencing industrial performance in the Indian context.

Efficient resource utilisation helps generate surpluses, which can be reinvested towards the creation of further resources. Hence, improvements in efficiency have an impact on the future productive capabilities of nations by providing higher levels of re-investible surplus. For example, Jones (1991) indicates that a 5 per cent increase in the efficiency of state-owned enterprises, without any changes in prices or investment, would result in freeing resources of about 5 per cent of GDP in Egypt, or reduce 50 per cent of

direct taxes in Pakistan, or fund a 150 per cent increase in government expenditures on education, health, culture and science in China. The release of a similar quantity of resources can transform Indian industrial performance.

There are some possible explanations as to why state-owned entities show lower efficiency. They have been prey to inappropriate location and technology choice decisions, irrational product mixes, and imposed marketing arrangements. These decisions have been made for political considerations, and have not been based on economic criteria [Bardhan 1984; Bhagwati 1993]. As a result, few choices and incentives are given to managers to maximise economic residue, and neither are they accountable for attaining efficiency because ambiguous and non-economic objectives have driven decision-making. For example, in the Indian context these socio-economic objectives include the promotion of income and wealth redistribution, creation of employment, promotion of regions, promotion of import substitution, and being "model employers" [Marathe 1989]. Also, in the Indian context state-owned enterprises have been used to implement government policy with regard to stabilising commodity trade, or in making transfer payments to various specific sections of the community [Jalan 1991].

However, other key reasons as to why government-owned enterprises are likely to be less efficient relate to the type of monitoring managers in these enterprises are subject to. In the Indian context, government-owned enterprises are subject to the detailed oversight of the parent departments, as well as legislative oversight by committees on public undertakings of the central and states' legislatures. Therefore the issue of ownership diffuseness is not a problem. Yet, enforcement of legislative committee findings does not take place [Chaudhuri 1994; Marathe 1989], and the disciplining hand of the capital market is also absent. Consequently, attaining efficiency is not a primary managerial motivation in the government-owned sector.

Second, the identity of owners is a factor arising from which government-owned enterprise managers tend to become agent without principals. Controlling-department bureaucrats, then, become *de facto* owners of such government enterprises. However, a major phenomenon to emerge in India is that of state-legitimised rent-seeking which has an extremely enervating effect on efficiency [Bardhan 1984]. For example, often the creation of government-owned enterprises has been driven not by ideological or pragmatic reasons, but to create extraneous opportunities for senior civil servants or politicians [Chaudhuri 1994].

For example, Marathe (1989:184) quotes B K Nehru, a former ambassador of India

to the US, who has also held several key appointments in economic spheres. "It is simply that it has become common practice for public sector enterprises, particularly in the states, to be made into mechanisms to provide powerful politicians, who cannot be accommodated as ministers, with salaries, perquisites, patronage and opportunities to make money through corruption." Bardhan (1984:69-70) also writes "Senior appointments in the public sector are sometimes made more on the basis of political patronage than of merit (leading often to low morale in the ranks of the technocracy in the enterprises). Headships of public sector units, particularly under the state governments, are indiscriminately used as political sinecures. Efficient managers who fail to satisfy the minister's political clients are often arbitrarily transferred". The impact of such a phenomenon is to create a cadre of managers in the public sector who are agents without principles!

Some authors [Vickers and Yarrow 1988] have argued that, given differences in ownership structures, the nature of competitive conditions faced is a key factor in eliminating efficiency differences between enterprises. The data, however, do establish that given similar competitive playing fields, institutional influences felt by the owners does matter in impacting performance in India. Such evidence is contrary to what has been established in the west [Caves and Christiansen 1980; Borchering, Pommerchne and Schneider 1982]. The fact that the public sector, in much part, consists of a number of private sector enterprises which ought to have been eliminated from the industrial landscape of India by selection pressures from the environment, is an indication of the policy malaises which leads the public sector to be appallingly inefficient.

However, public sector management reforms, which were started in the 1980s and continue to this day, have also had a major impact, as shown by the significantly increasing trend in efficiency of the government-owned sector in the 1981 to 1988 period. Therefore, in the Indian case it is not only necessary to continue with the major liberalisation to encourage industrial growth, but also to undertake speedy restructuring of public sector management and control practices so as to continue the realisation of efficiency gains.

A key limitation of this study has to be discussed. It is with respect to the data used. While it can be concluded in the aggregate that government-owned firms consume a greater quantity of inputs, relative to private firms, in generating value added, finer analysis has not been possible. Within the data for each sector, say the central government-owned sector or the private sector, are contained information on firms belonging to several different types of

industries. Data of finer granularity may reveal the specific industries in which state-owned firms excel at, or are particularly inefficient in. However, while key micro-level information may be available for one sector, such information is not generally available for other sectors. Therefore, comparative efficiency assessment has been feasible at an aggregate level of analysis.

VII Conclusion

In this paper efficiency differences between government-owned, joint sector and private sector enterprises in India were evaluated. Using data for the entire Indian industrial sector, enterprises owned by the central government and the governments of various states are found to be systematically less efficient than either joint or private sector enterprises, while joint sector enterprises are less efficient than those in the private sector. The analyses show that assumptions of theory, positing higher performance for the private sector, cannot be disproved in the Indian context, and contradict all extant evidence [Bhaya 1990; Jha and Sahni 1992; Ramaswamy and Renforth 1994], which have found no sectoral performance differences. Government-owned enterprises are key players in the industrial arena and the results obtained provide indication that they may, in major part, be responsible for India's lack-lustre industrial performance.

Refocusing India's Competitive Advantage in a Borderless World

Challenges to Corporate Sector

S L Rao

In the new borderless world we are moving towards, we must aim to raise the competitive advantage of all sectors in the nation. This requires a different set of government policies, but industry and individual companies have also a great deal to do to improve their own competitive advantage, ranging from actions to raise productivity, brand building, emphasis on R and D as well as changes in attitude to the centrality of the customer and focusing on manufacturing as a discipline.

WE must define the terms that we are using in these discussions. By India being in 'a borderless world', is presumably meant that the import tariffs are at or are near the levels in other countries; that both imports and exports are relatively easy and not subject to constraints; that there is easy flow of money across borders; that direct and institutional investments also flow easily into and from the country, and that India is a player in the 'inter-linked economy (ILE)' with a great deal of intra-firm trade. In this sense, India is still far from being borderless with the world. But we are today much closer to it than we were before, and over the next few years we will get even closer since we are committed to bring down our import tariffs so that the maximum rate does not exceed 30 per cent (vs 65 per cent), and to move to full capital account convertibility in a few years. Our present maximum tariffs are higher than in almost any other country in the world, there is a trickle in relation to other countries, of foreign direct and institutional investments, though far more than it was until three years ago; overseas companies are beginning to buy whole or divisions of companies in India; Indian companies are looking at investments overseas and accessing overseas capital markets; there is a partial capital account convertibility since institutional investors can bring in and take out their money without any difficulty. We are no longer insulated from the world. For example, for the first time, a few weeks ago, Indian stock market prices fell with those of other markets in the world in response to a rise in US interest rates.

COMPARATIVE ADVANTAGE

The other concept is that of competitive advantage which can be traced to the writings of Michael E Porter. This is a refinement of the concept of comparative advantage. Economists have for a long time used the concept of comparative advantage to argue for more international trade. The idea of comparative advantage is that different countries have different endowments of the

principal factors of production, namely, land, labour, natural resources and capital; and that these different endowments give them different levels of advantages in the supply of products and services. International trade allows a nation to raise its productivity. It does so by eliminating the need for producing some goods and services and by concentrating on those in which it has superior endowments. Porter argues that this formulation does not take account of consumer preferences. Consumer preferences can be influenced so that companies are able to develop segments of markets and brand identities. Such market segmentation and brand development can give the company that succeeds, superior advantages compared to other manufacturers. Further, governments themselves can improve factor advantages through various schemes of subsidies, incentives, special depreciation allowances, cheap export finances, cheap land, low interest costs, undervalued foreign exchange rates, etc.

In past years, Japan and Korea have successfully used both routes to improve their comparative advantages. India tried the government route and in the process so over-regulated industry and trade that the results were quite contrary. With the new GATT Agreement and WTO, governments will find it much more difficult to artificially improve factor advantages.

DISTORTIONS OF COMPARATIVE ADVANTAGE

In India, the concept of comparative advantage was distorted by a number of government policies. Concepts of monopoly or large houses, self-sufficiency and import substitution carried to the extreme, led to serious distortions in the economy. Other policies like Rupee Trade led to India exporting to earn hard currency, paying hard currency for imports and then re-exporting to Rupee Trade countries to earn Rupees. Export subsidies of various kinds made it difficult to see that India was the net loser in these transactions. Export subsidies which were to stimulate exports did so at the cost of domestic consumers. Import substitution policies and the craze for self-sufficiency led

to uneconomic production which needed high import tariffs and to our producing inefficiently, in low capacity plants and at high cost. Low prices for some agricultural products compared to international prices, subsidies on inputs to agriculture, etc. mischannelled resources so that we began to produce low productivity crops at high costs, instead of concentrating on those of which we could get better productivity.

COMPETITIVE ADVANTAGE

Porter has argued that international trade must expand, based not merely on cheap wages and weak currencies but because of productivity advantages in all areas. Hence to understand "competitiveness at the national level, we must understand instead the determinants of productivity and the rate of productivity growth" [Porter 1990]. "Developing nations are frequently trapped in industries ... in which labour costs, at industrial resources are important competitive advantages. Exports then compete on factor costs and prices" [Porter 1990]. Competitive success depends on competitive advantages which can be brought about by producing at lower costs and marketing differentiated products that command premium prices.

There is enough research evidence to show that India's productivity levels have lagged behind most other countries in agriculture, infrastructure, industry and in many service industries.

DEVELOPING COMPETITIVE ADVANTAGES

Competitive advantage of all players in the economy, in every sector, can be improved by improvements in the physical and social infrastructure, power, telecommunications, transport (railways, ports and roads), housing, financial services. All these are inadequate in quantity and deficient in quality in India in varying degrees. The quality of human resources is not optimised because of poor food delivery to the poor, inefficient health and educational services, a practically no

existent social security system, poor nutritional standards of a large number, and inadequate training facilities in the various skills required to service a fast growing economy. However, even if these do not improve quickly, there are many things that can be done at the levels of the industry and the company which can improve competitive advantage.

To develop competitive advantages in industry we must have economies of scale and therefore go for larger capacities in manufacturing. Or we must master the technologies that enable low cost, decentralised production, with centralised marketing. In any case we have to produce efficiently, with high quality, and standardised products and services. Detailed industrial licensing, import controls, and government induced adversarial relations between small and large industries prevented Indian industry from following this route.

If we are to be competitive we need at every level in the economy, to (a) develop new technologies which are not identical to those used by others; (b) develop differentiated products; and (c) Improve infrastructure resources so that there are no constraints on the developing of industries.

In each of these India has lagged behind in almost every sector of the economy.

SOME PRE-CONDITIONS

What are the implications for action, of trying to develop competitive advantages for Indian business? Some essential pre-conditions are discussed below.

Vision: Each business must develop a strategic vision for the future, based on its inherent strengths. In the past many businesses may have been established on the basis of available industrial licences, or because there was a shortage. In a more open economy and with competition, a business must have a well-developed and articulated picture of what it is about and where it wants to be in the future "in creating sustaining values for the customer far better than those of competitors" [Ohmae].

Productivity: Each enterprise must make choices based on the ways in which it can improve its productivity. Some actions for this purpose, are:

(1) It must aim to concentrate on its core competences. This will mean divestments of unrelated businesses, and acquisitions and new investments to strengthen the core businesses;

(2) prepare for competition in a borderless world (as of now, India is not in that situation). Even vertical integration of companies might become a competitive disadvantage in future years. For example, Henry Ford-I had vertically integrated his automobile factory backwards to the point where he owned iron

and coal mines at the turn of the century. The Ford Motor Company of today has found it much more competitive not to be in all these fields but to concentrate on the production of automobiles;

(3) begin to look at productivity improvements in relation to others not merely within India but outside India. Porter has said that it might be a good idea if Indian companies work on the basis of Rs 20 to the \$ 1 and not the present Rs 31 or so, and on the basis that there are nil import tariffs so that the company can target to lower production costs and be really competitive under almost any conditions;

(4) begin to add value to resources in terms of people, technologies, capital, machinery, etc. This means investments in career development through training and job enrichment, participation at all levels, quality circles, cost improvement groups, suggestion schemes, etc. It means focusing on R and D, inventory control, materials usage, maintenance planning, etc. The business as a whole must look at every stage to do better with less and this must be a never ending exercise;

(5) introduce new practices at work in all spheres of business so that people have more responsibility for their work.

R and D: Indian companies have paid practically no attention to research, and rarely to development. They must begin to put in money into process and product development in order to upgrade both. R and D budgets must rise: use of co-operative and contract research must develop if in-house R and D is too expensive or difficult. The 1994 budget gives special tax incentives for private research contracted to public laboratories but has been little used.

In both 1989-90 and 1991-92 India spent less than 1 per cent of its GNP on R and D. This is lower than many countries, but given the low costs of scientific personnel in India, it still meant a large expenditure of Rs 5,141 crore in 1992-93. If we compare the per capita R and D expenditures in some countries in relation to India, they were

In	More than in India by
USA	X 210 times
Japan	X 140 times
S Korea	X 19 times

However, the expenditure on R and D in India in 1992-93 was mainly by

Central government	65 per cent
State governments	9 per cent
Private sector	15 per cent

Of the total expenditure, over 57 per cent went into space, nuclear energy and defence. The rest can be said to have gone into products and services for the market though it includes research expenditure on

environment of 8 per cent and on agriculture of 12 per cent.

The expenditures had little relation to the potential user of the R and D. There was little interaction between government laboratories, users and universities. Hence there has been little dissemination or conversion of R and D into new processes and products. Some attempt is being made to correct the institutional frameworks of government research laboratories and systems for recognition and rewards. Private sector R and D in many cases was really a name for the quality control function.

The fault is not that of the manpower. Very many high quality Indian scientists are doing extraordinary work in other countries, in many diverse fields. There are flaws in the way our R and D institutions are organised, good work recognised, freedom given to scientists to explore, and lack of intimate relationships with the user who must pay in advance for future results. These flaws have to be corrected.

Apart from limited R and D leading to little local process and product development, there is in India a preference for foreign R and D – and for technologies, products and processes, developed overseas. This is perhaps largely due to a lack of a successful record of work and is another argument for close interface between R and D and users. R and D must have an ultimate result.

Joint Ventures: Foreign investors in India were till 1991 allowed a maximum holding of 40 per cent in any venture. Many therefore went for Indian partners. The partners in these Indian joint ventures got to control the venture and the venture was the vehicle for foreign technology imports. The foreign partner allowed only limited access to his R and D work because he saw little reward and was afraid of losing his proprietary technology. However, the Indian partners who had the industrial licence did not in most cases do much to advance on the technology because they saw the licence as being enough to control the market in which there was little fear of new entrants.

As with cornering licences, companies cornered JVs for their technology collaborations. Unrelated diversifications with sub-critical capacities and technologies became the norm for many Indian industries.

Another fall-out of these joint ventures was that there are only a few major Indian brands in the organised sector. But there are many hyphenated brands – Merritt-Singer, Kinetic-Honda, Maruti-Suzuki, Shriram-Honda, Birla-Yamaha, Lehar-Pepsi, HCL-HP, etc. The JVs enabled MNCs to participate and understand Indian markets at low cost. It was a waiting game.

When the market opened up and they could take control, they had some knowledge about how to operate in India. It is not surprising, now that India is opening out, that MNCs are consolidating and asking for control or to take-over other enterprises and consolidate their positions.

The question is whether Indian companies should be afraid – or should they like the SSSs develop a spirit of enterprise among owners and managers of MSEs and LSEs? The answer is that all hope is not yet lost, but these organised sector industries which for years dominated Indian industries must change. Some ways in which they must change are described below:

Focus on Manufacturing: In Indian enterprises, finance and sales were for a long time given special rewards – not manufacturing. This must change.

(1) Some instances of the neglect of manufacturing in Indian companies can be seen in (i) MBA programmes, which emphasise marketing and finance. (ii) Production teaching is largely about operations research – not about manufacturing strategy, cost improvement, factor enrichment, etc. (iii) Many companies were set up with low capacities, based on poor technology, because of the licensing system. The limited capacity led to high costs. There was little development work, nor any attempt to upgrade products or quality. Some examples: (a) Our old fertiliser plants, (b) DMT/caprolactum units, and (c) alcohol-based chemicals.

(2) The manufacturing company with good practices will develop much more intimacy with suppliers, and treat them as part of the company. The company's experts help their suppliers to improve.

(3) Indian industry and consumers take cost plus pricing as correct, and continuous cost improvement to absorb increases is not our normal attitude.

(4) Companies must re-examine factory locations dictated in earlier years by licensing but which may be unsuitable for many reasons.

Focus Products on Customer/Market Segments: (1) Companies must focus products to homogeneous customer/market segments to give maximum satisfaction to customer segments. This will help to optimise prices and earnings while building customer franchise.

(2) The Indian consumer associates advertising and hence branded products, with quality. Survey data (NCAER-1994) shows that at the low levels of income of the majority, the consumer is willing to pay a little extra to ensure that he gets quality and value for money, but that he cannot afford the high prices of frill packed products which MNCs have developed as part of their global marketing. This is the challenge before Indian companies. They

have to build production facilities to cater to these mass markets and to design products that these markets can afford. These products must build their brand identities and companies must find creative ways to do so.

(3) The customer is the one who pays the bill; not the bureaucrat who controls as in the public sector, or till 1991 gave industrial and import licences as in the private sector.

(4) If the customer is the focus – quality will be supreme. In India the customer has had no choice, voice or exit.

(5) But companies must aim to at least satisfy customer needs. They must, therefore, know what the customer wants.

(6) The truly excellent company aims to delight the customer and give the customer more than he expects. We have examples of the last two in India but not enough. To be competitive, companies must consciously build the attitude of delighting the customer. **Develop Brands.** Indian companies need to develop strong domestic brands and to target for a large domestic market base. Brand building does not necessarily always require large investments of money but understanding of the prospective user and his needs. Many brands that have been developed in India have shown this understanding, e.g., Nirma, Rasna, Vicco, Promise, Thermax, Bajaj; but they belonged to the small or medium category of enterprise, not the large organised sector.

Quality: The truly competitive company knows that quality does not consist in merely getting ISO certificates from Bureau Veritas Quality International. It has to develop the ingrained culture that goes with consistent quality standards. Quality improvements are seen by many Indian companies as an additional cost and grafted on to the production system. But if quality is a core company value it has to be built in to the systems. There is evidence that a total company orientation to quality can in fact reduce cost.

Indian Public Sector: The Indian public sector works under the severe handicap of government ownership. This makes it vulnerable to many pressures due to ideology, politics, bureaucratic changes, and lack of commitment and accountability among government representatives. Labour in the public sector has much greater authority over management decisions and this is a bottleneck to improving productivity. Business decisions in competitive situations, cannot be taken in the open and be subject to public scrutiny. But the public sector has to be more open than the private sector in this respect. For all these reasons, improving public sector efficiencies with government ownership and control is a difficult task. The public sector in India if we include power, telecommunications, railways, ports, roads

and posts is crucial to our competitive advantage as a nation. If these areas do not perform efficiently, the nation loses a lot of its advantage.

Small-Scale Sector: The small-scale sector is another area in which productivity improvement is difficult. This improvement is essential for improved national competitive advantage.

Indian government policies merely encourage the small scale to remain small. There is little automation, an inability to keep costs under control, and reliance on special preferences from government. The small scale accounted for more than 35 per cent of the contribution of the entire manufacturing sector NDP in 1987-88. Small units are suppliers to the others. They are where workers in larger enterprises many times get their initial training. If this sector remains uncompetitive and in continuing need of protection, it will pull the whole national competitiveness down. However, the organised sector can help the small scale to improve by partnering them, as has happened in Japan and elsewhere.

Industrial Clusters: Porter's analysis of the competitive advantage of nations shows that industries develop in clusters and these locational clusters enable substantial improvement in productivity, as units learn from each other and develop suppliers and skills in a synergistic way. It is not as if India does not have such industrial clusters. From the top of my mind I can list the following:

Hosiery:	Tirupur
Textiles:	Bombay, Coimbatore and Ahmedabad
Brassware:	Moradabad
Electric motors:	Coimbatore and Rajkot
Readymade garments:	Delhi, Bombay and Bangalore
Shoes:	Kanpur and Agra
Tannery, leather and leather chemicals:	Madras
Petrochem and plastics:	Baroda
Industrial chemicals:	Bombay
Software and hardware:	Bangalore
Gems and diamonds:	Surat
Powerlooms:	Biwandi, Surat and Ichalkaranji

There are many others.

However, the Indian clusters tend to focus around large cities and towns. They do not develop in small places. The concentration creates major problems due to the clogging of transport and communication, and a breakdown in urban support system – e.g., health, sanitation and water supply. The poor living conditions are not conducive to major improvements in productivity. With

improved infrastructure these clusters could become important driving forces in the competitiveness of Indian industry. As a nation we must develop more such clusters in the country.

MICRO-LEVEL ACTIONS REQUIRED IN INDIAN COMPANIES

As we move into a borderless world, our corporate dinosaurs will become extinct. Many household names of today among companies and groups will disappear or become less visible.

In 1990 IBM had US \$ 6 billion as net profit. Within a year, IBM, Sears, General Motors had become dinosaurs, companies which were stumbling in an unfamiliar environment, and having new competitors eating away chunks of their markets. Now they are restructuring to survive, and successfully so. There is hope for our dinosaurs as well but only if they follow the mantras we have listed. Who are our emerging dinosaurs?

(1) The unrelated companies that have diversified into businesses due to earlier cornering of industrial licences and foreign collaborations and who so went into many different product markets. They have to develop sharper focus. In a group of diversified companies, each company must have sharply focused products and markets and must have the freedom to function without the baggage of being part of a group of other unrelated companies in different businesses.

(2) Family-managed groups that continued 'chromosomal management' when more competent people were available in the market. They will be overtaken by other companies run by professionals, whether from the family of the owner or not.

(3) JVs with foreign companies whose management control had stayed with local companies because of the 40 per cent limit on foreign holding. The foreign holder will sooner or later demand larger equity and control over the business, or refuse to update the technology.

(4) Those set up to take advantage of market distortions, e.g. alcohol-based chemicals.

(5) Companies which have made little or no investments in continuing product and process design and development will be overtaken by those that are doing so. In a growing market, lack of growth will lead to death.

(6) Companies that give low status to manufacturing; cost plus enterprises; these include a large part of the defence industries, many PSEs, monopoly companies, e.g. Maruti with no other integrated car as competitor will find it difficult when Daewoo and Tata come out with similar

cars produced in large volume factories.

(7) Private sector companies that thrived because their only competition was from PSEs and were able to stop worrying about customers, costs, and technology.

(8) Companies in sectors whose prices were controlled or administered, e.g. cement, vanaspati, sugar, etc. unless they learn new ways of survival, with competition and prices that are market-driven.

(9) Monopolistic or oligopolistic situations, e.g. SEBs.

EXECUTIVE IN A BORDERLESS WORLD

Peter Drucker's words are relevant to us in India -

(1) The individual has to take more responsibility for himself and have less expectation that he will remain in the same company throughout his life or enjoy guaranteed job security. Therefore the post reforms executive in India has to manage his own career self-development through training and building experiences into himself.

(2) Education is not enough. The manager must develop competitiveness. Some indications of personal competitiveness would be

- Liking pressure
- Calm in crisis or confusion
- Absorbing information by reading
- Learning to quickly read graphs and numbers
- Alert all the time to any fact or data to see how it affects his work.

(3) He has to develop empathy so that he can feel people's problems and concerns and deal with them before they become articulated and serious.

(4) Develop self-discipline and self-control by practising yoga, meditation, regularity in habits, care in diet.

(5) He has to learn to collect, assimilate and find the links in information. Lateral thinking is a useful technique to learn, where he can make linkages between disparate facts. Therefore he must know what information he needs, where it is, and how to get it. No one else may be able to tell him.

(6) Become understandable; information must be transmitted and stored if it is to be productive, not hidden.

(7) Team work; low brows must learn to work with high brows; not enough to be a specialist but need to be sympathisers of different fields of knowledge.

(8) Become executives not managers

- Responsibility is for an area.
- Not necessarily dominion over people.

(9) Managerial change is required in Indian work ethics and mind sets.

(10) Indian executives must learn to become more egalitarian - able to do many

things themselves, have more respect for others especially lower in hierarchy, because skills and ideas may not always rest with those in grey safari suits. They must learn to listen to all levels and not merely to the top, and to be less hierarchical.

CONCLUSION

India is still many years from entering the borderless world. Kenichi Ohmae described it as "the interlinked economy (ILE) of the triad (the US, Europe and Japan) joined by aggressive economies such as Taiwan, Hong Kong, and Singapore...". For all practical purposes, the ILE has made obsolete the traditional instruments of central bankers - interest rate and money supply. "The traditional way of looking at trade statistics, based on a nation's balance with another nation have become obsolete, because ILE residents have learnt to move their production and other functions around." India today is much closer to this borderless world than it was in June 1991 and is moving with speed towards it.

In this new world that we are in and are moving to, we must aim to raise the competitive advantage of all sectors in the nation. This requires a different set of policies for government which emphasises removal of distortions in the economy especially in the shape of government controls and regulations that hide the reality of the economic situation. Physical infrastructure and the social infrastructure for human development must improve rapidly.

However, industry and individual companies can do a great deal to improve their own competitive advantage. These range from actions to improve productivity, brand building, emphasis on R and D as well as changes in attitude to the centrality of the customer and to focus on manufacturing as a discipline. At the same time, the large role of the public and the small-scale sectors requires that they also march in step and action to improve their competitiveness, is required. The development of industrial clusters is another way to get synergistic development. If these actions are not taken, many Indian groups and companies will not survive long into the new century. The individual executive also has to change if he is to function effectively in this new situation.

Given that culture is the new face of imperialism – it is not altogether accidental that most popular and heavily funded academic area in USA is cultural studies – it should be pressed as a test case at the summit. The fundamental question is whether it is possible to interrogate the problem of social development and social integration in post-colonial societies without contending with the current practice of cultural imperialism, which aims at obfuscating an alternative vision.

Fossilising indigenous cultures forms a part of the agenda of cultural imperialism. For, within culture is embedded immense possibilities of challenge and resistance against all forms of domination. Many a cultural form and practice has crystallised in this context and many others have metamorphosed to meet this need. The evolution of popular culture in medieval times and the innovation of existing forms during the anti-colonial struggles are eloquent examples. This inherent quality of culture is now sought to be emasculated in diverse ways. A very effective method is appropriation and commodification which divorces culture from its creative milieu. Devoid of creative potential indigenous culture would face certain stagnation and eventual demise. The homogenisation and hegemonisation could then follow. The cultural project of imperialism is thus based on an inter-linked dual strategy. Cultural appropriation and cultural imposition.

This agenda has very serious implications for social integration which the summit is hoping to achieve. Colonialism has already spawned an identity crisis, particularly among the middle class. The contemporary cultural imperialism tends to deepen the crisis, be it in relation to daily preoccupations like leisure and entertainment or food and dress or in respect of linkages with tradition, knowledge or art. An urge to overcome this is quite natural and to some extent compelling. An easy and possible solution for many would lie in reinforcing the roots which in turn tends to lead towards fundamentalism and communalism. In the process if religious life is divorced from social life, conservatism and 'modernity' could happily co-exist, as is evident in the Indian middle class. Such a tendency would not contribute to social integration, on the contrary, it would only sharpen conflicts and extenuate contradictions in society. It would adversely affect the interests of the minorities, as they would be increasingly excluded from the mainstream.

The summit's agenda of social development, in the absence of an adequate recognition of the cultural dimension, is incomplete and ineffective as far as developing countries are concerned. The National Report of India is no better. It does not go beyond listing the achievements of the state and as such is a misleading document for any meaningful discussion. For any rethinking on social development, the implications of cultural subjection have to be taken into account.

Research positions available in a reputed Research Centre in New Bombay for visiting fellows, Research officers/Assistants/Consultants on regular and contract basis. Pay scales for visiting fellows Rs. 3,700 - 5,700, Research officer Rs. 1,660 - 2,660, Research assistant Rs. 1,200 - 2,040 plus allowances. Minimum emoluments range from Rs. 2,963 to Rs. 8,690 on prevailing rates of allowances and Consultant on short-term contract on consolidated fee ranging from Rs. 3,000 - 5,000 per month.

Minimum qualification for all the posts is a post-graduate degree in social science. Preference being given to Ph.Ds for visiting fellows and consultants. Those with technical qualification particularly in industrial technologies/processes are also welcome. Retired persons under sixty-five years preferred for consultants. Wide exposure to field conditions in rural development and rural industries programmes, and work of voluntary agencies and with good knowledge of one and more regional languages preferred. Minimum experience two to ten years depending on the positions sought. Apply with detailed C.Vs and two referees within 30 days to the *Director, Vaikunthbhai Mehta Research Centre for Decentralised Industries, Plot No. 7, Sector 15, P.O. Konkan Bhavan, CBD Belapur, Post Box No. 24, New Bombay - 400 614.*

DIRECTOR

Unveiling Bhutto

S Zulfiqar Gilani

Zulfi Bhutto of Pakistan: His Life and Times by S Wolpert; Oxford University Press, New York, 1993.

ZULFIKAR ALI BHUTTO (January 1928-April 1979) was an enigmatic person. He came from a very well-established Sindhi feudal family but adopted socialism as the platform of his political party. He continually appealed to the masses and brought dignity to the impoverished but also humiliated and trashed anyone who he felt to be crossing his path. He was urbane at one time and a ruthless Sindhi feudal lord at another. The paradoxes of his nature were multiple and complicated [Fallaci 1974; Taseer 1979]. He continues to evoke passion and interest both in the layperson and the scholar. For the interested academic, his life, and death, could be a rich source of information through which to try to understand Pakistani politics and society and/or the enigma of his person. Consequently he has been rather extensively written about. The most recent writings are Syed's *The Discourse and Politics of Zulfiqar Ali Bhutto* (1992) and Wolpert's *Zulfi Bhutto of Pakistan: His Life and Times* (1993).

In this essay the focus will be on *Zulfi Bhutto of Pakistan*. (From now on Zulfi will refer to Wolpert's book, and Bhutto to Zulfiqar Ali Bhutto, the subject of Zulfi). Wolpert tries to provide the motivational bases for Bhutto's actions and to provide a psychological understanding of the man in the light of his personality. Thus Zulfi is both a psycho-biography and a psychologically informed history. Such attempts can be welcome additions to our understanding. On the other hand they could lead to mystification and entrench already existing biases. The outcome is a function of the manner in which data is analysed and the inferences drawn.

SOME MATTERS OF FACT

We will start with the easier task of pinpointing some factual errors. Here Wolpert has faltered on a number of basic points. For example, he implies that the word 'siasat' is from the Sindhi language. The word actually has an Arabic root and is also used in Farsi (Persian).¹ In all likelihood it became part of Urdu through Persian. It has been certainly part of the Urdu language and used in all parts of the subcontinent. More significant is the meaning Wolpert understands the word to have. According to him it is "an ancient term

derived from the feudal code of honour whose most important attributes were *loyalty* and *vengeance*" (p 7, my italics). Unfortunately the source of this meaning is not identified. For a Pakistani this meaning would be quite alien and unfamiliar; the colloquial meanings being politics. The connotations that *siyasat* (politics) has attained in the popular mind are quite rich and complex. Loyalty and vengeance may be part of that meaning complex, but that by no means is anywhere near the whole story. This may seem like belabouring a trivial misunderstanding of a word. But, it will become apparent that this 'misunderstanding' reveals, and foreshadows, the general tenor of Wolpert's analyses.²

Wolpert reports (p 45) the imposition of martial law in early 1953 because of rioting by the ahrars. In fact the rioters were primarily members of the Jama't-i-Islami. However, much later (p 238), he correctly ascribes those (riots) to the followers of Maulana Maudoodi, i.e., the Jama't-i-Islami. On page 81 he refers to "West Pakistan's tough Punjabi chief minister, the nawab of *Kalambagh*". On that single page 'Kalambagh' is referred to three times, obviously because the nawab (of the so-called Kalambagh) was for many years an important figure in Ayub Khan's regime. In all likelihood he is talking about the nawab of 'Kalabagh', Amir Mohammed Khan, who was the governor, not chief minister, of West Pakistan. There were no provincial chief ministers at that time because there were no provinces, with One Unit in place and a presidential system of governance.

Much later (p 203) he places Khan Abdul Ghaffar Khan in self-exile in Kabul. In fact Ghaffar Khan was in Jalalabad through most of the period of self-exile. Kabul and Jalalabad are both Afghan cities, but there are important ethnic differences in the two, and Ghaffar Khan's choice of Jalalabad was not fortuitous. Wolpert refers to Yahya Bakhtiar as a Frontier barrister (p 231). This is inaccurate. Bakhtiar is no doubt a pukhtoon, but from Baluchistan.

There is a somewhat confusing reference to the sorry event of Liaqat Bagh Rawalpindi on March 23, 1973. He says: "Wali Khan's tough frontiersmen and the Pir of Pagaro's hurs fighting PPP Punjabi troops trucked in from Sialkot and Campbellpur to wage

'operation sugar candy' against the pathans bussed in from Peshawar" (p 212). It seems unlikely that Pagaro's hurs travelled over a thousand miles north to participate in a public meeting in Rawalpindi. To the present author's knowledge this is the first time that hur involvement has been reported in the event under discussion. At that time both Wali Khan and Pir Pagaro were opposing Bhutto but they never joined forces in the manner implied by Wolpert.

ISSUES OF METHOD

The application of psychology to history is a problematic which has generated a lot of debate. While some consider the use of psychology in history to be necessary to the point of being inevitable [Langer 1958; Runyan 1988], others have been critical of such marriages because they feel that the emphasis on an individual results in elitism, reductionism and so on [Ratcliffe 1980; Stannard 1980]. It is not feasible to get into that debate, the purpose of mentioning it was to touch upon some of the possible pitfalls in works of this nature. In a nutshell, there are methodological issues which need to be kept in mind, otherwise one can easily reach misleading conclusions, dramatise, and/or trivialise [Waelder 1971; Erikson 1971; Gay 1988; Runyan 1988].

Before venturing into an examination of Zulfi, it should be mentioned that historical accuracy is not of central interest for our purposes, it is the psychobiography and the psychologically informed aspects of the work that will be focused upon. We will therefore be scrutinising only those parts of the study where psychological interpretation has been utilised.

There are two major methodological flaws in Zulfi, namely, reductionism and (problems of) countertransference. The latter clearly lies entirely in the psychological domain but where there is an attempted understanding of the psyche of an actor, it becomes very relevant [Loewenberg 1988].

We will now try to illustrate where and how Wolpert's method of analysis resulted in drawing debatable conclusions and inferences. Beginning at the beginning, Wolpert says:

Zulfiqar Ali Bhutto, microcosmic reflection of Pakistan, was never a simple personality.

His unique charisma and deep-rooted failings that brought him to an early and violent death emanated from his *schizoid personality, the strengths of one part of which were matched by weaknesses of the other*, the depths of its dreadful darkness mirroring the brilliant heights of its most powerful peaks (p 3, emphasis added).

It is quite interesting that Wolpert so easily, and early on, labels Bhutto schizoid. Even more interesting, and novel, is what he understands the word to mean. It is not relevant to go into technical details of the schizoid personality, and anyhow Wolpert is a historian not a psychologist. However, the dictionary meanings of the word need to be kept in mind before labelling.¹ A look at the basis of Wolpert's diagnosis reveals that his statement is based on weak material. The matching of strengths and weaknesses does not indicate any special psychological condition. That sort of a contradiction is discernible in almost every human being. There is, however, a deeper problem nested here. Encapsulated in this brief statement is a general 'explanation' of Bhutto and his successes and failures. And the basic premise (the schizoid personality) of the explanation is highly questionable. There is a logical leap in his presentation of Bhutto as a 'microcosmic reflection of Pakistan'. This is an important and loaded phrase which remains unsubstantiated: it is also a good illustration of Wolpert's proclivity to give significant one-liners.

In trying to establish the developmental roots of Bhutto's personality, Wolpert focuses on the likely infantile and childhood experiences. For example, early on in the story he has the following to say about Bhutto's relationship with his mother:

No familial bond in south Asia is closer than that which ties a son to his mother, yet Zulfi's deep emotional attachment to his young, *often lonely* mother was even stronger, it seems, than the norm among families as large as the Bhuttos. ...Zulfi's mother, moreover, *knew that her son was destined for greatness!* ...She adored, clung to, and hopelessly spoiled him as only a *desperately lonely, virtually outcast insecure* young mother can spoil a darling son (pp 19-20, emphasis added).

There is quite a bit of conjecture in this segment, which seems to be a function of basing reconstruction on insufficient evidence. It is fairly safe to assume that the child Bhutto, like any other male child in the subcontinent, had deep emotional attachment with his mother [Kakar 1978]. That in itself is not very revealing. It is the precise nature of the attachment which can provide insight into the likely developmental consequences for the child. Unfortunately no material is provided to describe the relationship as it actually existed. Instead there are conjectural statements about the

mother's loneliness, her fore-knowledge of the son's destiny, and her spoiling of the adored child. All of what we are expected to accept may be quite veridical. But then it may not. With historical figures, 'sufficient' data may not always be available about certain stages of their lives. That does not mean psychobiography is not possible but it does alert us to the need of caution and care [Runyan 1982].

He continues to speculate on the likely psychological foundations of Bhutto's personality. The language is poetic and appealing, but is it revealing? He says:

Zulfi's mercurial temperament, the strange sudden shifts in his moods, his suspicious ambivalence toward most people, even his closest 'friends' and colleagues, may in some measure be traced to his doting mother and aloof father, and to the inherent incompatibilities of their worlds and natures, one basically marginal and insecure, the other overconfidently arrogant. *His genetic code was at any rate a curious blend of polar qualities.* Shah Nawaz's feudal pomp and power, Lakhi Bai's low-caste fears, lack of familial fortune, deep-seated doubts as to her very worth, her own tenuous toehold in the Bhutto world she had entered by a side door of passion left ajar. How many of her darkest hidden anxieties had this mother conveyed to her *frail, sensitive* child? ...All the superstitions, traditional caste fears of Hindu India, her ingrained belief in rebirth and karmic pollution, in the impact of every deed, and the darkest dangers of mixing forbidden human fruits and duties, dangers worse than death, for death itself could mean release from rebirth, the highest form of happiness, escape from the traumas of life and the hateful curses of jealous 'enemies'. *Surely she must have conveyed through her small body's mother's milk itself her deepest fears of strange, foreign 'enemies' everywhere*, within the very walls and shaded rooms of the house they inhabited, among his father's closest relatives, his jealous first wife and her kitchen coterie of 'spies' and servants (p 20, emphasis added).

In order to better explain the contradictions in Bhutto's behaviour he widens the canvass:

All the clashing pluralisms of south Asia itself, a riverine blend of Hindu-Muslim, highborn and outcaste passions, conflicts, harmonies, and hatreds flowed in Zulfi's blood, an inharmonious mix of the light and dark, a *microcosmic reflection of Islam's violent assault upon and unstable, conquest of the body politic of Hindudom.* And added to that impossible blend, of course, was the superimposed external world of an English Christian west, whose patina of polite privilege and imperial arrogance had been donned with knighthood and knee breeches by his proud,

pompous prince of a father, magistrate-wadero of Larkana, Sind's mughal on the Imperial Council, a red-cheeked English governor's companion and right hand man. *Was it a wonder Zulfi should be so strangely complex, inherently incompatible within his many psyches, forever unsure of which Bhutto he was? Hindu outcaste? Sufi saint? Or the Zulfikar - Sword - of Islam?* (pp 20-21, emphasis added, except 'Zulfikar' in the last sentence).

Wolpert is essentially saying three things here: There is the description of the (imagined) phenomenal world of the mother. According to him, it was a paranoid world with enemies and spies everywhere. Again we are expected to take this at face value, which is fraught with problems. The second thing he is saying is that these paranoid feelings were transmitted to the suckling child through the mother's milk. This could be metaphorical, although the wording does not easily allow that reading. Finally, he is saying that this paranoid world was the polar opposite of Shah Nawaz's pomp and that contradiction (between the parents' social positions) resulted in Bhutto's mercurial temperament.

The author is making two questionable assumptions. One, that the psychological worlds of the parents were mirror images of the social. Two, that that contradiction got mapped onto/into the internal psychological world of the child. An isomorphism between the (external) social and (internal) psychological is being posited. No evidence is provided to substantiate the first assumption. Regarding the second, in psychology it is considered axiomatic that there is unlikely to be much correspondence between an external situation and the perception/s, feelings and memories of it. Nevertheless, the individual's psyche is embedded in early events as experienced. Early experiences rarely have a direct impact on adult personality. They shape early personality, influence the kind of environment likely to be encountered and the manner in which it is likely to be experienced which in turn influence later experiences which affect personality, and so on in recursive interaction [Wachtel 1977].

Having 'established' a personality profile of Bhutto, we are provided with evidence in support of the thesis. For example, in chapter 3 ('Brief California Interlude' Bhutto's night of revelry in New York is described in his (Bhutto's) own words (p 32) Wolpert then goes on to interpret the material. He says:

his half-hallucinatory description of 'terrible human' skyscrapers 'soaring with emotion' is startling in what it reveals about the state of his mind and the ubiquitous polarity of his passions and feelings. ...Zulfi's love-hate relationship with the United States was to remain unresolved, new 'uncontrollable'

emotions' of suspicion looming in his mind till his last days (p 32).

Wolpert sees the feelings expressed by Bhutto as indicative of his ambivalence and paranoia. The event may be revealing but caution needs to be exercised when psychoanalysing the writings of an idealistic, drunk, young man. This episode is being overloaded with meanings. In addition, it is also used as a window to explaining Bhutto's stance in later years towards the US: Wolpert extrapolates Bhutto's later ambivalence towards the US from these feelings of his student days there. Too much is being explained through this single episode.

Throughout 'Zulfi' the tendency to stay at the surface is quite easily discernible. When that happens in history, we end up settling for unexamined clichés in explaining human behaviour. The result is a sort of 'grandmother' psychology which relies primarily on intuition and folk wisdom. More ominously, such history can end up perpetuating and strengthening the very deceptions which need to be uncovered. For example, on page 241 Wolpert reports:

Hanif Ramay suggested that the strange 'split' or 'division' in Zulfi Bhutto's personality was perhaps attributable to the enormous 'cultural differences' that divided his mother from his father. ...Rafi Raza and admiral S M Ahsan also remarked on the split personality, which partitioned Zulfi into a rational, intelligent, responsible Bhutto on one side, and an irrational, impulsive, uncontrollable Bhutto on the other. *Whether he was, in fact, one or twenty-one Zulfi Bhuttos may never be known, but he was a complex personality* (emphasis added).

One wonders about the usefulness of the information that Bhutto had a complex personality: Such statements give only an illusion of understanding.

The image one gets of Bhutto is as a passive victim of ancestral history who, puppet-like, is pulled here and there by the strings of socio-psychological fate. Witness 'The incongruous blend of his feudal genetic and covered over with a thin veneer of socialist ideals acquired from his studies and personal exposure to prejudice of every sort conspired to help Zulfi resolve during his years overseas to devote his life to global political diplomacy at the helm of Pakistan' (p 38, emphasis added). Bhutto is given the 'freedom to resolve' but within the conspiracy of events beyond his control.

The underlying problem in Wolpert's analysis is *reductionism*. One can discern three versions of reductionism. First, he overemphasises the psychological without adequate attention to the sociological and political realities in which Bhutto grew up, lived and died. His (Bhutto's) behaviour is almost always linked to a psychological cause, which happens to be his split

personality. Second, there is almost an exclusive focus on Bhutto's personality problems/psychopathology and insufficient attention to his normality and creativity. Finally, and most critically, Bhutto's adult personality is explained entirely in terms of his childhood experiences and possible later formative influences neglected. When there is a proclivity to psychologise, it is tempting to try to explain adult behaviour in the light of childhood experiences. However, this connection is often difficult to establish in a simple manner, because life is complex. People (not only, or all, psychologists) who have attempted to understand such connections become aware of the pitfalls and are wary of jumping to simple, linear, reductive conclusions. Wolpert presents his thesis with an over-abundant confidence, as a result one gets a rather impoverished, and very debatable, picture of his subject.

In psychoanalysis, reciprocal transference was considered a problem by Freud, i.e., *countertransference* (the feelings evoked by the analysand in the analyst) had to be resolved if therapy was to proceed. More recently, it has been cogently argued that countertransference be accepted as a useful and valuable instrument to understanding

transference (the analysand's feelings towards the therapist) and communications [Fromm-Reichmann 1950; Stone 1984]. In psychobiography, then, it is useful to be aware of, and make use of, the feelings evoked by the subject. Thus countertransference can be an impediment or instrument, depending on whether or not the analyst recognises such feelings and uses them for understanding.

It seems that Wolpert failed to take into account the feelings evoked (in him) by the subject of his study. It is evident from the material presented in Zulfi that Wolpert had complete access to the Bhutto library. Additionally, it seems that he was provided very generous opportunities to meet with and talk to members of Bhutto's family, and friends [Kennedy 1994]. Such conditions make for good empirical work but, if not properly understood, may create problems of countertransference. Stated simply, it means that inevitably the biographer is likely to develop feelings towards the subject. And if those are not recognised and taken into account, the likelihood of vision getting clouded increases. The vignettes which reveal Wolpert's feelings are too many to enumerate. Two very

randomly selected examples are given as illustrations:

He was witty and charming, handsome, glib if not brilliant, certainly well read, well informed, and passionately opinionated, ready at any time of day or night to drink, argue, laugh or make love. ... Had he not gone abroad to complete his education... Zulfi would in any event have embarked upon a political career in Karachi. *His ambitions, then, would have been less grand*, confined perhaps to the chief ministership of Sind or membership in the Pakistan central cabinet. *Because of the University of Southern California, the University of California, and Oxford University, the world became his stage, and premier power the pearl he sought in every oyster he pried open* (p 38, emphasis added).

Wolpert is somewhat patronising and would have us believe that the single major cause for Bhutto's attempt at joining the ranks of international leadership of that time was his exposure to western universities.

And again:

He was the living image, the three-dimensional vital incarnation of many Pakistanis' wishful dream of themselves: tough yet tender, a practical idealist, smart as a cat-o'-nine-tails whip, swifter on the draw than a Texas cowboy, and better in bed or as the head of state than any Indian, Russian, or Englishman. He was Quaid-i-Awam Zulfikar Ali Bhutto! (p 227).

The above is Wolpert's imagined description of Bhutto's thoughts. The imaginative leap, into Bhutto's subjective ruminations, which Wolpert takes is fairly frequently employed throughout 'Zulfi'. This is a technique used in fiction and fictional accounts of actual events and/or persons,⁴ sometimes referred to as 'faction'. However, employing this in a historical work raises a host of questions and problems. We will not enter into that debate but suffice it to say that this work of history is heavily imbued with the spirit of faction. And that says a lot about 'Zulfi'.

CONCLUSION

There is no debate about the centrality of Z A Bhutto to the politics and recent history of Pakistan. Because of his continuing impact on the politics and political culture of the country, the task of understanding him, his policies, and leadership style gains even greater current urgency. In that sense, Wolpert's 'Zulfi' is a timely work. The historical information presented is thorough and detailed, though most of the essentials have been documented in earlier works on Bhutto. Wolpert's major addition to those is his attempt at trying to embed Bhutto's political actions in his personality make-up. And that aspect of the book is wanting on a number of counts. It can be argued that

since Wolpert is a historian and not a psychoanalyst, he should not be faulted on grounds of psychology. That argument, however, fails because 'Zulfi' is clearly a psychobiography and history informed by psychology.

The most glaring weakness in the psychologising in 'Zulfi' is that of reductionism. Wolpert argues that Bhutto's was a split/schizoid personality and tries to establish the roots of this in early childhood experiences. The case is however extremely weak because of lack of presented evidence and questionable reading of the available material. The problem is worse confounded because Wolpert then proceeds from this arguable premise and tries to explain almost everything in terms of the psyche of the protagonist. An inherent weakness of psychodynamic explanations is that the same phenomenon can be explained in a number of different ways. The safeguard, first suggested and used by Freud, is 'rich description' and triangulation, both notable by their absence in 'Zulfi'.

Bhutto evokes strong feelings in people: Some hate, others love him. Consequently, it has been difficult to come across dispassionate accounts of his person or policies.⁵ Wolpert also fails to step back enough to provide an unbiased understanding of the man. There is a strong journalistic flavour to the book and it is heavily peppered with dramatic words, phrases, sentences and paragraphs. Personal information therefore is in the nature of scoops. There is a notable shortage of empathy and sensitivity. There is also a considerable lack of caution and demonstration of bravado in the connections made and inferences drawn. Such discourse makes appealing reading but it feeds the very deceptions and biases which need to be uncovered.

Notes

- 1 According to Hans Wehr's *A Dictionary of Modern Written Arabic* (1966) (edited by J M Cowan), the Arabic root word is 'sasa' which could mean to govern, rule, dominate, lead, guide or direct. 'Siyasa' (plural, 'siyasat') means administration, management, policy. The derived meanings include political or diplomatic.
- 2 This misreading of 'siasat' was repeated in the BBC2 television programme ('The Bhutto Dynasty') aired in Britain on February 3, 1994. The likelihood of Wolpert's Zulfi being the source seems high. The spread of the misunderstanding can be well imagined.
- 3 According to the Chambers 20th Century Dictionary, schizoid means "Showing qualities of a schizophrenic personality, such as asocial behaviour, introversion, tendency to phantasy, but without definite mental disorder".

- 4 There are countless works of this nature but the most directly relevant example is L Collins, and D Lapiere, *Freedom at Midnight*, Avon Books, New York, 1976.
- 5 The work suffering least from bias is S Taseer's Bhutto: *A Political Biography*.

Strengthening Direct Taxes

Some Suggestions

Aamresh Bagchi

Revenue from direct taxes – both personal and corporate – has shown impressive growth in the years of economic reform. It would, however, be unwise to be complacent. The ratio of direct tax collections to GDP in India still compares poorly with that in other developing countries. Rough calculations suggest that the 'tax gap' continues to be quite large and the personal income tax is able to capture only about 50 per cent of its potential.

The Tax Reforms Committee had laid out a two-pronged strategy to improve the yield of income tax – widening the tax base combined with moderation in rates on the one hand and strengthening the administration on the other. Several measures have been taken to implement these recommendations, but much still remains to be done.

I Tax Gap

REVENUE from the income taxes – both personal and corporate – has shown impressive growth in the last three years (1991-92 to 1993-94), the years of reform. Personal income tax (PIT) revenue has multiplied by nearly 21 per cent per annum marking a jump of 3 percentage points over the growth recorded in the preceding five years, while revenue from corporate tax (CT) increased at the rate of 26 per cent comparing with about 18 per cent during 1985-90. The proportion of direct taxes in the central government's gross tax revenue has gone up from 19.2 per cent in 1990-91 to 27.6 per cent in 1993-94 [Bagchi 1994]. Collections this year as reported also seem to be buoyant. It would, however, be unwise to be complacent.

It is pertinent to point out that the ratio of direct taxes collected at the central level to GDP still remains at about 2.6 per cent (of which 1.3 per cent is from CT and 1.2 per cent from IT). This level will still not be exceeded or may go up to 2.7 per cent at the most in the current year even if the budget targets are met. Though this marks an increase of about 0.5 percentage points over what was prevailing before the reform, this level of direct taxation still compares poorly with that of other developing countries. The average ratio of direct taxes to GDP for LDCs taken together is about 5.5 per cent and for even the poorest LDCs it is 3.5 per cent. The Tax Reforms Committee (TRC) had set a target of raising the yield of income tax by at least two times which would translate into a ratio of 5 per cent of GDP. These goals still remain distant.

Rough calculations based on available data suggest that the 'tax gap' (the difference between potential revenue and the actual collections) is still quite large and PIT is able to capture only about 50 per cent of its

potential. The calculations are fairly straightforward:

- * From information available from National Accounts Statistics aggregate personal pretax income (at market prices) for the year 1993-94 may be taken at Rs 6,50,000 crore. Assuming that roughly 60 per cent of this was derived from non-agricultural sources, income potentially taxable under the Central income tax may be put at about Rs 4,00,000 crore. Going by the income distribution pattern revealed by past studies, about 40 per cent of this (or roughly, Rs 1,60,000 crore) may be taken to be accruing to the top 10 per cent of the population. Even if one allows for a 10 per cent margin of error, Rs 1,40,000 crore may be estimated as the potential personal income tax base. A tax levied at the average rate of 15 per cent on this should yield Rs 21,000 crore whereas the total revenue from personal income tax in 1993-94 was according to revised estimates about Rs 9,500 crore. In other words, even with the higher growth of the last three years PIT is tapping less than half of the potential. Almost one-third of the revenue deficit of the year would be wiped out if only this potential could be tapped.

- * Assuming the elasticity of PIT revenue with respect to income to be unity, and projecting nominal income growth for the year at 15 per cent, the potential PIT for 1994-95 may be placed in the region of Rs 24,000 crore. Collections from PIT is unlikely to exceed 50 per cent of this potential even if the budget target for the year is achieved.

- * According to the C and AG's report on direct taxes for the year 1992-93, the number of individual income taxpayers was 6.4 million. Of them, those with income exceeding Rs 5 lakh numbered 16,936. Bombay alone would have individuals many times this number

having income of more than Rs 5 lakh a year!

- * The number of people belonging to the relatively affluent section of the population – the group that offers an attractive market for consumer products – is believed to be not less than 200 million. According to an NCAER survey, 2.3 per cent of the population has a household income of more than Rs 78,000 per annum (*Economist*, January 21-27, 1995). Assuming that, of them, 15 million derive their income from non-agricultural sources, each earning at least Rs 1,00,000 year, it should be possible to raise at least Rs 20,000 crore from them if only everyone of them pays Rs 15,000 in tax annually (at an average rate of 15 per cent of gross income).

For improving the yield of income tax the TRC had laid out a two pronged strategy, viz, widening of the base combined with moderation in rates on the one hand and strengthening of administration on the other through modernisation (based on modern information technology) and suitable incentives for staff. Several measures have been taken to implement these recommendations but much still remains to be done.

II Unfinished Tasks

EXPANDING TAXPAYING POPULATION: PRESUMPTIVE ROUTE

Base widening has to proceed in two directions, viz, (i) bringing in a larger number of potential taxpayers into the net and (ii) eliminating the numerous exemptions and deductions provided in computing taxable income to serve non-tax objectives. The scheme of presumptive taxation for small taxpayers inviting them to file a simple statement with a payment of Rs 1,400 by way of tax was intended to serve the first

objective, viz, getting more people to pay income tax without having to undergo the hassles associated with filing a regular return. This scheme does not seem to have been very successful. The results are reported to have been particularly disappointing this year (1994-95).

Casual conversation with small traders (like street stall holders) suggests that the reasons for the poor response to the scheme are two-fold: (i) fear of getting into 'the clutches' of the IT department, once a person files a statement with them and (ii) a widespread perception that nothing happens if one does not pay any income tax. These perceptions are not easy to erase. Critics of the scheme argue that this scheme is fundamentally flawed and the government should not go about with a 'begging bowl' for contribution from small traders. This criticism is based on a misconception about the purpose of the scheme. The idea underlying it is not to do away with the Income Tax Department's responsibility to identify and book all those liable to pay income tax but only to make it easy for those who are marginally taxable but do not maintain regular accounts to avoid going through the formalities of keeping detailed records of their transactions as an alternative to filing regular returns. There is no reason to suspend the scheme because of disappointing response so far. On the contrary, there is a case for strengthening it with some tangible evidence of the tax department's friendly attitude to those who voluntarily come within its fold and a vigorous campaign putting forward the benefits of compliance.

Evidence in the form of a token for presumptive income tax payment (or a permanent account number) may be made a precondition for access to utilities like power or telephone, gas or water connection, house permit by municipalities, credit facilities by banks and financial institutions, registration of vehicles, insurance of life, assets and so on. The problem in India is that agricultural income is not liable to central income tax and so disabilities for non-registration with the Income Tax Department would hurt people in deriving income from agriculture. To avoid causing hardship to farmers, the requirement of producing evidence of income tax payment or registration with the department by obtaining PAN or certification of payment of presumptive tax need not be insisted upon for providing facilities in rural areas.

It is also important to see that those who graduate to higher levels of business turnover and income do not have to face an unfriendly tax department. The estimated income scheme provides a handy instrument for this purpose.

The estimated income approach based on the presumptive principle has been extended

in recent years to certain categories of taxpayers, e.g. those having business of civil construction and transport. It would be helpful to extend this approach to a wider field. That would require developing norms for estimating the turnover and the ratio of net profits to turnover (where the taxpayer maintains regular books of accounts) for different industries on the lines of 'Tadrichs' of Israel. There are at present 140 Tadrichs prepared by the economic division of the national tax office in Israel, each dealing with a given industry/business activities. While it would require time to draw up such norms for different activities on this scale, a beginning may perhaps be made now. Objectively determined norms would be a very valuable aid in the scrutiny of returns to be taken up for detailed examination.

Simultaneously, every effort has to be made to gather information regarding new registrants or potential taxpayers from available sources such as banks, electricity and telecommunication authorities, joint stock companies, other tax departments (particularly sales tax), professional bodies/chambers of commerce and industry and so on. It is believed that plans are under way to allot a Tax Identification Number to every potential income taxpayer. This should go a long way to extend the coverage of income tax provided there is an efficient system of storing and processing the information which would be flowing in on a massive scale once the tax identification numbers are allotted and information from third parties starts flowing in.

BASE WIDENING

Base widening also implies moving towards a comprehensive income base by removing the exemptions and deductions which are allowed on various considerations of social and economic policy. As is well known, the basic thrust of tax reforms that have taken place across countries during the 1980s has been towards widening the base and moderating the rates combined with tightening of administration. In Indonesia, for instance, the maximum income tax rate was reduced to 35 per cent but all so-called incentive provisions were withdrawn.

In India, the tax rates have been brought down and several of the incentive provisions were withdrawn but quite a few still persist. Reference may be made to the Chapter VIA of the IT Act and the sections which are still operative, like Sections 80D, 80G, 80GG, 80GGA, 80HH, 80HHA, 80HHB, 80HHC, 80HHD, 80HHE, 80IA, 80JJ, 80L, 80Q and so on. Then there are numerous exemptions/concessions provided through other sections (e.g. Section 10). Given our compulsions, it may not be possible to remove all of them. But, so long as these remain on the statute

book there is no case for lowering the marginal rates any further.

TAXATION OF FRINGE BENEFITS

The TRC had also recommended some tightening of the tax laws to tax the value of fringe benefits like concessional accommodation to employees more effectively. These recommendations have not been implemented. A separate tax on fringe benefits payable by employers has been introduced in Australia and New Zealand with good results, contributing over 2 per cent of the total revenue of the government in both countries [Sandford 1993]. With the removal of restrictions on salary levels in the private sector, there is no reason why fringe benefits should not be taxed at current market values. It would be administratively simple – though not appealing from the viewpoint of equity – to levy the tax on employers, as in the two countries mentioned above.

RATE REVISION: PERSONAL INCOME TAX

Unless the base is made truly comprehensive, there is no case for lowering the tax rates any further. However, consideration may be given to a revision of the rate structure by widening the slabs and raising the level at which the maximum rate would apply, from Rs 1.2 lakh at present to Rs 2 lakh. The structure would then look as follows:

	(Per Cent)
Up to Rs 35,000 of total income	Nil
Between Rs 35,000 and 75,000	20
Between Rs 75,000 and 2,00,000	30
Above Rs 2 lakh	40

If combined with withdrawal of incentives there may not be any revenue loss while it would help to neutralise the impact of inflation to some extent.

TAX RATE FOR CORPORATE INCOMES

On the corporate tax side, there is no intrinsic case for reducing the tax rates further. According to a KPMG Survey, the average rate of corporation tax in OECD countries stands at present at a little over 37 per cent. However, in some of the Asian countries the maximum tax rates for companies are lower as shown below:

Countries	Rate (Per Cent)
Australia	33
Indonesia	35
South Korea	34
Malaysia	34
New Zealand	33
Philippines	35
Singapore	27
Thailand	30

Considering the need to maintain parity with rates prevailing in neighbouring countries, the rates for corporate tax may be brought down to 35 per cent provided that all incentive provisions in the tax laws are abrogated as in Indonesia. If, however, the maximum rate of corporate tax is reduced, the rate for personal income tax cannot be raised, in fact may have to be lowered. Considering everything, the rates prevailing at present for both PIT and CT may not be disturbed.

RATIONALISATION OF INCENTIVE PROVISIONS

The TRC had recommended elimination of most incentives except those meant for promoting savings and exports. The existing provisions that extend concessions for savings and exports are complex and overlapping. For instance, a fraction of savings in specified assets qualify for tax rebate under Section 88, while income from certain saving instruments is deductible in computing taxable income (subject to a specified limit). Then there are reliefs for contribution to provident fund and total exemption of interest on accumulated balance thereon. It would have been simpler and more rational from the economic angle too if the concession in tax was provided on a *net saving* basis as was recommended by the TRC.

The exemption for export earnings from income tax is now spread over several sections (viz, Section 80HHC, 80HHC, 80HHD and 80HHE). It would help simplify the tax laws considerably if these were consolidated and exemption of 50 per cent or even 75 per cent was allowed on all foreign exchange earnings if brought into the country. That would only require producing evidence in support of the foreign origin of the income and repatriation of incomes earned and brought from abroad.

In any case, the task of rewriting the Income Tax Act by weeding out the cobwebs that have accumulated over the years remains to be taken up earnestly.

TACKLING ZERO-TAX COMPANIES

The main factors that drove the tax reforms of the 1980s in the US and other countries was the desire for fairness, efficiency and simplicity. Incentive provisions in the tax laws were seen as a major impediment to achieving these aims. Because the opportunities for availing the incentives are not open equally to all activities or businesses, these provisions, it was felt, were a source of distortion and inequity, apart from being responsible for complexities in the law and sapping the buoyancy of revenues. In India too, the justification for incentive provisions in the tax laws has been widely questioned especially when it was found that several

apparently prosperous companies paying handsome dividends were getting away without paying any income tax. These were often reported to as "zero-tax" companies. With the move towards elimination of incentives, the scope for reducing taxable profits legally to zero should have gone. This does not seem to have happened. The phenomenon of 'zero-tax' companies has surfaced again.

Among the unaudited financial results of companies for the first half of 1994-95 published in the newspapers in the last few weeks, it is seen there were quite a few whose 'provision for taxation' is nil. These include not only companies engaged in production but also several leasing and finance companies. How such these companies are managing to reduce their profits liable to taxation to nil even after the reforms is somewhat difficult to understand and needs thorough study and investigation by the Income Tax Department.² Meanwhile, consideration may be given to levying a 'minimum tax' particularly on companies to make sure that tax incentives do not work too unevenly across enterprises and activities.

As noted on an earlier occasion in these columns [Bagchi 1994], in the OECD countries, where the top marginal tax rates for personal income tax fell from 61 per cent to 44 per cent as a result of the reforms, in order to recapture some of the revenue loss and counter tax avoidance through the use of tax deductions/allowances, *schedular minimum taxes* are now being imposed. In its 1986 Tax Reform Act, the US introduced an alternative minimum tax, requiring top income earners to pay the greater of 21 per cent of their gross income or the normal rate applied to their taxable income. There are similar provisions in Canada. Denmark introduced a 12 per cent supplementary tax on 'personal incomes' (gross income minus incomes) exceeding a specified level. In 1986, Norway applied a 'top tax' at the rate of 8.5 per cent on gross income [Shome 1993].

In India, an attempt was made to impose 'a minimum tax' on companies through a special provision in the Income Tax Act

(Section 115J). The provision was, however, withdrawn because of complexities and also because it was felt redundant once the major incentive provisions like the investment allowance were withdrawn. With the reappearance of 'zero-tax' companies, the feasibility of having a minimum tax on businesses (or at least companies) needs to be explored in order to improve fairness and revenue buoyancy of the income tax. A minimum tax serves as a check against avoidance and evasion through manipulation of accounts. Mexico's tax on gross assets of businesses provides a good model for the purpose.

GROSS ASSETS TAX AS A MINIMUM TAX ON BUSINESSES

A tax at the rate of 2 per cent on gross assets was imposed on business enterprises and individuals in Mexico in 1988 (effective 1989). A similar tax at the rate of 1 per cent was introduced in Argentina in 1990. Several other Latin American countries were (or are) also likely to follow these examples.

The two main factors that seem to have impelled those countries to go in for such a tax are: need for additional revenue in countries undergoing major adjustment programmes and the anxiety to neutralise the damage caused by substantial inflation to the traditional taxes on business income. Another major consideration was tackling evasion and avoidance. A minimum tax on gross assets as a presumptive tax on enterprises also promotes efficiency since under such taxation, the tax is levied only on 'normal income' and the marginal tax rate for any income exceeding the 'norm' is zero.

The base of the gross assets tax, should, according to experts, comprise all fixed assets like land, buildings, plant and machinery – that is, assets which are essential to the production process of the firm. (Intangible assets like goodwill may also be included in the base but not holdings in fully or partly owned subsidiaries or other companies.) Exclusion of the last few items

TABLE: SIMULATION EXERCISES FOR DIRECT TAXES ON COMPANIES
Flat Rate Applied to Gross Fixed Assets of Individual Companies Where Actual
Tax Is Less Than the Flat Rate Applied (For 1992-93)

(Rs crore)			
1	Direct tax	1601.77	
2	Gross fixed assets	82774.96	
3	Flat rate of tax applied on GFA (per cent)	2.00	1.50 1.00
4	Gain in tax collection	1131.55	826.23 527.56
5	Number of companies with gain in tax collection	234	218 208

Notes: (1) The source of basic data used in the present simulation exercises is the Statistical Profiles of 500 private corporate giants compiled by the Centre for Monitoring Indian Economy.

(2) Gain in tax collection is defined as the difference between the rate applied on GFA and the actual direct taxes reported by individual companies, where this difference is positive.

is needed in order to avoid double taxation. Cash balance, accounts receivable, inventories and other 'current' assets also need not figure in the base as these are not essential to the process of production. Only the real value of the assets (that is, depreciated book value suitably adjusted by a price index) should be the base.¹ Rough computations based on a sample of 500 companies in India show that a 2 per cent tax on the gross fixed assets might raise the revenue from the corporation tax by almost 75 per cent and an one-and-a-half per cent tax by 50 per cent which would come to at least Rs 5,000 crore (*vide* the table).

The tax on gross assets might lead to cash-flow problems for low-profit and loss-making companies. The aim of course is to punish inefficient companies and induce efficiency in resource use so that there is a built-in pressure on corporate enterprises to show better financial results. However, one can think of ways in which the hardship likely to be caused by a gross assets tax to companies unable to generate profit in a particular year. Since the tax on gross assets would be intended to serve as a minimum income tax, the excess of this tax over the income tax payable in a given year on the basis of profits computed for the published balance sheet of the company in question may be allowed to be carried forward and set off against income tax dues in the next five years or so. If the levy of a gross assets tax is agreed to in principle, refinements can be thought of in the light of experience gained in other countries such as Mexico.

It may be mentioned that the legality of the gross assets tax was challenged in Mexico on the ground that it violated the basic provisions of the Constitution requiring 'equality' in taxation in proportion to the ability to pay. But the courts upheld the tax as legal, principally because it was a minimum tax and not an additional impost.

With a gross fixed assets tax, taxation of the unproductive assets in business enterprises would have to be withdrawn. Revenue yield of that tax is insignificant and so its withdrawal should not matter.

EXTENSION OF WITHHOLDING

A device of proven efficacy in the enforcement of income tax is withholding at source, for that minimises the opportunity to omit income. Even in a country like USA, it is found that compliance rates are the highest for incomes subject to tax withholding on information furnishing by third parties (e.g. for wages and salaries, and interest) while compliance was least for informal supplier incomes as the following figures would show:

Compliance rates for different classes of income for the US in 1981 and 1987 (Per Cent)

	1981	1987
Wages and salaries	94	97
Interest	86	80
Capital gains	58	85
Informal supplier income	20	11

Source: Wallchutzsky (1993).

The 'Prescribed Payments System' of Australia requires income tax to be deducted not only for wages and salaries but also for the following services:

- Building and construction
- Joinery and cabinet making services
- Architectural services
- Engineering services
- Surveying services
- Motor vehicles repair
- Cleaning

In India, the attempt to extend withholding to services of professionals has met with resistance. The attempt should not be abandoned. Rather, consideration may be given to the feasibility of levying a withholding tax at 20 per cent on interest on deposits in banks or corporate entities and dividends as a final tax. This no doubt would compromise vertical equity but would be more equitable on the whole by ensuring that these incomes do not go untaxed altogether and also lead to considerable simplification of the tax laws and procedures.

Driven almost to desperation in not being able to tackle inflated claim for expenditure deduction in computing taxable income, Philippines prescribed ceilings on such deductions under what was called 'Modified Gross Income Tax' and 'Simplified Net Income Tax'. These might look like extreme remedies but some ceilings on certain expenditure items are often necessary to counter the practice of evasion by inflating deductible expenditures.

III

Measures to Induce Compliance and Help Enforcement

While consideration should be given to measures like the presumptive income approach, schedular taxation and extension of withholding to cover as many income payments as possible, ultimately, compliance would depend on the social and cultural environment in which the tax administration operates and that is not easy to change within a short period. Researches on factors influencing taxpayer behaviour show that compliance impress if tax officials act as 'facilitators' for tax payment rather than a policeman for detecting evasion. To quote the editor of a recently published collection of essays incorporating the findings of research on 'Why People Pay Taxes':

If there is a persistent theme to the essays presented in this volume, it is a change in perspective away from deterring noncompli-

ance toward positive encouragement for compliance – an emphasis on the 'carrot' for compliance rather than the 'stick' for noncompliance. Positive attitudes toward the tax system and pleasant, efficient contacts with the tax collection agency can increase compliance. This insight is especially important because, from the tax collection standpoint, it is extraordinarily expensive to arrange an enforcement regime so that, from a strict cost-benefit calculus, noncompliance does not appear attractive to many citizens. It follows that methods that reinforce and encourage taxpayer's devotion to their responsibilities as citizens play an important role in the tax collection process [Slemrod 1992].

However, as the compiler of the volume Joel Slemrod, a noted expert in this field, observes at the end, while the 'carrot' has its use, the 'stick' also should not be abandoned. A judicious mix of the two is what is needed. For this purpose, some of the innovative measures adopted by other developing countries with handsome results, may be taken note of. These are:

Developing an efficient information system:

It is universally acknowledged that the most potent instrument in curbing non-compliant taxpayer behaviour is to have an efficient information system whereby information regarding all substantial financial transactions is passed on to the tax department and these are safely stored in a manner that facilitates easy retrieval for checking the returns and supporting accounts filed by taxpayers. Computers provide a very powerful tool for this job as also other functions of the tax department (like monitoring the filing of returns, payment of taxes and tax deduction at source).

Indian Income Tax Department is now going in for computerisation in a big way and it is hoped that this will change the taxpayers' perception regarding the probability of getting detected if one fails to report one's income fully. However, for a computerised information system to perform efficiently it is also necessary to get business enterprises to maintain proper accounts and discharge their statutory obligations to furnish information regarding transactions and/or taxes deducted at source without fail.

Stricter accounts keeping requirement: For improving the habit of proper accounts keeping and flow of third party information the following measures might be helpful:

- * For businesses having turnover exceeding a specified level keeping of accounts in prescribed form may be made compulsory with penalties for failure to do so. In Israel, book keeping requirements are laid down separately for different kinds of industries/activities with certain disabilities like rejection of accounts, additional tax of 10 per cent (if default

persists, 20 per cent), disallowance of losses and indexation for inflation, disallowance of interest on borrowings for payment of tax, disqualification for entering into any transaction with government agencies and so on [Singh 1995].

- * Mexico too introduced as part of reforms fairly stringent book keeping requirements for taxpayers who grow beyond a prescribed threshold in size. They are required to keep records of transactions on a daily basis and issue receipts to all customers. Exceptions were made for certain categories of taxpayers like farmers and truckers. Invoice issued by these falling under the scheme have to provide details of taxpayer identification number of the sellers as well as buyers apart from particulars of goods/services sold. These were helpful also for implementing VAT. The sanctions against invoice irregularities were strictly enforced: 2,685 businesses were shut down in 1993 and fines imposed in 24,781 cases for a total amount of as much as 29 million new pesos [Mookerjee 1994].

Indian Income Tax also contains certain provisions requiring maintenance of accounts by certain persons carrying on profession or business and audit of accounts where total sales/gross turnover exceeds Rs 40 lakh (Sections 44AA and 44AB). But the sanctions against failing to maintain proper book are weak and not very clearly spelt out. One does not know whether any one has been punished for failing to comply with these requirements.

Reducing the scope for harassment and collusion: A persistent complaint of taxpayers has been harassment by corrupt officials and needless litigation by the department itself. Some of the measures that can be taken to reduce the scope for complaints are:

- * Assignment of cases for scrutiny by the head of a local office at random instead of going by fixed jurisdictions. Cases scrutinised should be countersigned by the next senior officer.
- * Cases for scrutiny should be selected by a group of officers not connected with assessment and by applying parameters derived scientifically through computerised formulae.
- * Appeals by the Income Tax Department against unfavourable orders should be confined only to cases which involve substantial revenue or important point of law. Recommendations made by committees and experts have universally emphasised the need to reduce the number of appeals and streamline appellate procedures. Much still remains to be done.

Finally, no sustained administrative improvement can be brought about unless there is a credible system of rewards and punishments for tax officials. That is a task which tax administration has to address

earnestly if improvement in the buoyancy of income tax revenue is to be sustained.

These are only a few suggestions for consideration for the coming budget. There are many other areas of anomaly and needless complexity in the laws. Despite the careful examination of the TRC and its recommendations, the laws and procedures remain complex. A much simpler law is needed to help implementation and voluntary compliance.

It should be added that compliance behaviour of taxpayers in a country has much to do with its community's culture. The one clear finding of research in this area is that it is ultimately peer pressure that compels people to pay their proper taxes. Cultural change, however, does not come about easily or quickly. Hence the need for persistent efforts to create an environment that fosters such change.

Notes

- 1 For pros and cons of presumptive direct taxation, see Rajaraman (1995).
- 2 It appears the liberal depreciation provisions granting 100 per cent depreciation to several items of assets has facilitated tax avoidance and enabled companies to reduce their taxable profits to zero or near zero. This is done by claiming 100 per cent depreciation in the first

year and 'selling' the asset to a sister concern who then leases it back to the parent company and claims depreciation on it. No doubt, the sale price of the asset so transferred reduces the value of the block of depreciable assets in the books of the parent concern but, overall, there is net tax saving, taking the two companies together, with no additional real investment taking place.

- 3 For a lucid exposition of how such a tax can be divided, see Sadka and Tanzi (1993).

Beyond Colonial Crumbs

Cambridge School, Identity Politics and Dravidian Movement(s)

M S S Pandian

Cambridge historiography has claimed that politics in India is constituted by factions formed vertically through patron-client nexuses and are motivated by narrow economic and short-term power interests. It conflates the biography of the coercive colonial state and its Indian elite collaborators as the history of colonial India. In this article the author develops a critique of the Cambridge school by expanding the gamut of the political so as to include the mobilisation of alternative public spaces by the subalterns of the dravidian movement.

The public gathers in two kinds of spaces. The first is a space that is public, a place where the public gathers because it has a right to the place; the second is a space that is made public, a place where the public gathers precisely because it doesn't have the right – a place made public by force [Acconci 1990: 901].

'THE great Indian faction', a product of Cambridge school's historiographical practice, has been a subject of much contestation and critical scrutiny. The faction theorists, in their different incarnations, have claimed that politics in India is constituted around factions which are formed vertically through patron-client nexuses (instead of horizontally across shared identities such as class, caste and gender) and are motivated by narrow economic and short-term power interests (instead of commitment to varying ideologies). Critical scholarship on such theorisation has established that it is anchored in structural functionalist methodology and behaviourist assumptions [Hardiman 1986]. Taking such critiques to more generalised and substantive levels, Ranajit Guha (1992) has shown how the Cambridge school has conflated the biography of the coercive colonial state and its Indian elite collaborators as the history of colonial India. Furthermore, for him, such exclusionary history, given its neo-colonial moorings and by the strategy of silencing anti-colonial and other contestations by the subaltern classes, represents colonialism as a hegemonic system based on the consent of the colonised.

While I draw substantially on these critiques of the Cambridge school, I have a slightly different and a limited agenda in this paper: I intend problematising the Cambridge school's silencing of political subjectivities based on identities such as class, caste, gender and language, in the specific context of their writings on the dravidian movement(s). I hope, through such a critique, one can repossess the political which has been made unavailable for the subaltern classes in the scholarship of the Cambridge school and recuperate inferiorised identities as an important aspect of subaltern politics. This will, to my mind, enable us

to construct alternate and combative narratives of the dravidian movement(s)

I begin this paper with an account of how the dravidian movement(s) and caste¹ have been represented in the influential works of two faction theorists, David Washbrook and Christopher Baker, and proceed to establish the limits of their framework through an interrogation of the fissures and slippages in their own texts. In the final section of the paper, I propose an alternate way of seeing, substantially based on the debates around Habermas's by now well known concept of 'public sphere', which may facilitate the writing of the dravidian movement(s) history from the vantage point of those who are disempowered through inferiorised identities.

I

David Washbrook begins his history of the dravidian movement(s) and the location of castes in the colonial Madras presidency with a paradox. To quote him,

...when overt communal conflict appeared [in Madras presidency], it did so in the most remarkable of forms. One community [the non-brahmans], representing 98 per cent of the population and possessing the vast bulk of wealth and political power, denounced another community [the brahmins], which consisted of less than two per cent of the population and was possessed of nothing like the same economic and political resources, for oppressing it [Washbrook 1977:7].

Baker (1974:xi) too begins the history of the dravidian movement(s) with the very same paradox: "...while movements which claimed to protect a minority were a common feature of the new politics of India in this period of councils, ministers, and electorates, it was unusual, if not paradoxical, to find a movement which claimed to defend a majority – a majority which included up to 98 per cent of the population and almost all the men of wealth and influence in local society." The paradox was constructed by foregrounding the poor brahman and the rich and powerful non-brahman, that is, by a critical displacement of caste with class: "...while there were

a few brahmins who were rich and powerful, the majority, if it is possible to generalise at all, were employed in occupations that were essentially menial – as cooks, scribes and religious functionaries – and could be purchased by the wealth of other castes for a few coins or a broken coconut" [Baker 1974:29].

As Washbrook and Baker progress with their argumentation, what looks like a paradox dissolves into a non-problem: caste identity turns out to be an illegitimate candidate for political history. This is achieved through a series of methodological moves which, at one level, reinscribe the relationship between the brahman and the non-brahman as non-antagonistic, and, at another level, represent different castes as fragmented on the basis of interests which are not located in caste identities themselves.

Let us begin with the manner in which the relationship between the brahman and the non-brahman is represented in the scholarship of the Cambridge school. Here, Washbrook and Baker invest the so-called 'sanskritising' desire of the non-brahman castes with primacy and deploy the same to signify the relationship between the non-brahman and the brahman as devoid of antagonism:

...any attempt to attach social and cultural dimensions to the non-brahman cause ran immediately up against the dilemma over popular attitude to the brahman. A good many of the non-brahmins in south India accepted the brahmanical code and brahmanical behaviour as the model of ritual purity. Many articulated their wish to rise up the social scale by adjusting their customs and habits to those practised by brahmins, and many expressed their own, exalted view of their status by demanding to be called brahmins [Baker 1976:29; emphasis mine].

As Washbrook would put it, "The social models which [non-brahman] magnates tended to emulate were, if not actually brahmanic, at least placed within a brahman dominated hierarchy" (1977:282).² According to him, in contexts where the brahman was unworthy of emulation, he was either ignored or kept as a dependent, all of which subverted any possibility of antagonism:

To our interpretation the political division of society into brahman and non-brahman makes no obvious sense... this lack of antagonism is not surprising when it is remembered that brahmans supplied status legitimacy to most of the groups of state-level culture but had little contact, and were ignored, by the vast majority of local-level cultural groups; nor when it is recalled that even in their contact with most other state-level groups, brahman priests were usually poor dependents who either did what they were told or starved [Washbrook 1977:274; emphasis mine].

What is more, such non-antagonism between the brahman and the non-brahman was furthered by the very nature of the caste system itself, which, according to Washbrook, is flexible. Referring to the upward mobile non-Brahmin groups, he notes, "The character of economic and educational change meant that there was no general pressure on the status categories of the existing social hierarchy. The flexibility of the caste system itself, however, also took much of the steam out of communal politics" (1977:128).

If antagonism between the non-brahman and the brahman was non-existent, caste identity itself was more a fiction than fact. Washbrook finds caste identity to have been always already fragmented; and when he reassembles the fragments, he arrives at 'inter-communal' blocks forged on the basis of patron-client nexuses and instrumental reason:

as in the case of artisans and workmen... compact local units of caste among 'service' groups were broken by economic ties with outsiders. Lawyers had to find members of other communities to give them cases, clerks and *gumastahs* needed employment with brokers and contractors who seldom were of their caste, and lower government servants had to rely on the co-operation of various local notables. Very rarely were these 'service' groups free to take political action as communities. In Madurai in the early 1880s, for example, there was a storm of protest over an aspect of municipal government from the area of the town in which most of the brahman clerks and lawyers lived. A Ratepayers Association was formed to campaign at the impending elections for the protection of brahman religious privileges. Yet, when the votes were counted, it became clear that the brahmans were unable to poll a majority even in the ward in which they formed most of the voters. A merchant-financier, living in another part of the town was returned as their candidate. It was also in Madura in 1915 and 1917 that K M Alladin Rowther, the notorious Muslim criminal, was elected from the same brahman-dominated constituency... [Washbrook 1977:138].

For the Cambridge school, these day-to-day transactions among the members of different castes and the 'cross-communal'

loyalties invalidate caste identity as such as a category of the political: "If they [castes] are to be regarded as political communities, the nature of their union is better understood by the metaphysician than by the political historian" [Washbrook 1977:127]. Thus, caste becomes merely an idea without any real existence.³

The metaphysical of the Cambridge school refuses to retreat from the political: caste identity was enunciated with vigour as an unifying category in the political discourse of the times. Here, the Cambridge school employs a different strategy to paralyse caste identity. First of all, after reducing caste as a figment of imagination, they set up a conceptual barrier between the universe of ideas and the universe of politics: "What is interesting to political history is not the ideational antecedents of the movement but the contemporary processes" [Washbrook 1977:287; emphasis mine]. Given this, political history should devalue what is uttered (that is, enunciation of ideas) by freeing it from what is achieved (that is, outcome), which alone is designated as political. For instance, referring to the Justice Party, Washbrook notes, "A large part of the non-brahman propaganda was written and performed by the leading Madras civilians; and it ought to be judged more by what it was meant to achieve than by what it appears to say" (1977:296-97). "What it was meant to achieve" is, of course, deduced from what was supposed to have been achieved.

Such conceptual separation of ideas from politics is legitimised by privileging certain instrumental reasoning. That is, for the Cambridge historians, ideas are mere means for the magnate-patrons and their publicist-clients to further their narrow interests:

In the area of public activity also, the magnate managed to preserve himself. Of course, it was usually with the support of magnate patrons that western-educated publicists financed their various associations, presses and tract societies. In these they were seldom more than the agents of magnate interests. Their endeavours were intended to highlight their patrons at least as much as themselves. That is not to deny the intrinsic importance of the new ideas expressed in reformist, revivalist and nationalist circles, which were the result of change in the educated community. But political history must deal more with the extent of influence and the effect of ideas than with the character of doctrines [Washbrook 1977:125].

Explicating further on the 'influence and the effect of ideas', Washbrook argues that enunciation of ideas simply translates itself into 'manpower' to settle factional disputes among magnate-patrons: "Cultural movements, logically independent of politics, were dragged into political life because they provided a pre-existing organisation which was valuable in raising

manpower" (1977:278; emphasis mine); and "...the fact that these cultural and religious movements were politicised in response to factional struggles implies that, once the factional alignments or tactics changed, they could be depoliticised" (1977:251).

Baker echoes the same view when he writes,

On closer inspection it is clear that these protestations did not mean that the rural population was being mobilised in communal blocks by caste leaders. In each case the local rural bosses were moving in to grasp the new opportunities of the rural boards and rural franchise for themselves and it was often useful for those displaced by this movement to cry out that they were the butt of communal campaign [Baker 1976:117].

Thus, the discursive formations around caste identities lack a will of its own; they become political only when appropriated by the elites to further their factional interests. In other situations, they dwell in the realm of the cultural or the social which has nothing to do with politics.⁴

In short, the disavowal of caste identity as part of the political is complete in the writings of the Cambridge school. If fragmentation of different castes denies caste the status of caste-in-itself, the way in which caste identity was supposed to have been invoked in colonial Tamil Nadu denies it the status of caste-for-itself. Caste identity is thus out in the cold with no political past or future.

Let us now turn to how the Cambridge school writes the dravidian movement(s) within this scheme of reasoning. The Justice party component of the dravidian movement(s), which among other things sought reservations for the non-brahmans in government employment and in the membership to legislative council and other bodies, turned out to be the easiest strand to be explained away by the logic of instrumental reasoning. For them, it was true that the Justice party "spread a wave of racial hatred across the presidency and threatened to tear southern society apart into mutually antagonistic political communities" [Washbrook 1977:1]. But in fact it was a threat which did not actualise itself:

...its [Justice party] attempts to erect a social and political philosophy often seemed confused and self-contradictory. In the period 1916-20, this did not help the non-brahman cause to develop into a mass movement. Its newspapers never gained a wide readership and were constantly in financial difficulties. Few branch associations were formed and even some of them had disappeared before the legislative elections in 1920 [Baker 1976:30].

Thus, the non-brahmanism enunciated by the Justice party was an idea without impact. It was empty of ideological substance and hence counterfeit.

Then, the invocation of non-brahmanism served the non-ideological (!) practical ends of the Justicites. If Baker (1976:62) writes that "The Justice leaders had... acquired a patronage bank. In many cases nominations to local bodies, temple committees and other boards were used to court MLCs and to build up a party of men obliged to the ministers in the legislative council," Washbrook's conclusion is no different. For him, "...it [Justice party] represented not so much an attack on brahmans' political power as pressure on those occupations and positions in magnate network... which brahmans filled in large numbers" (1977:275).

Thus, the Justice party was a group of western educated men who used non-brahmanism in a non-ideological/instrumental fashion to gain access to the patronage of the colonial state. As Washbrook sums up colourfully,

They [Justice party leaders] argued that their challenge was solely towards the secular, political position which brahmans had attained. Yet, once the brahman's spiritual role has been stripped from him, how can he remain a brahman in any meaningful sense? What the Justice party really objected to was the political position of certain individuals who *happened to be* brahmans [Washbrook 1977:279; emphasis mine].

The other component of the dravidian movement(s) in the colonial Tamil Nadu was the self-respect movement led by E V Ramasamy. The movement, as a policy, did not take part in such processes of politics which were institutionalised by the colonial state in the form of district boards, legislative council, and elections. Simultaneously, its propagandist energy which problematised caste, religion and gender, could not be easily fitted into the category of patron-sponsored publicists. Thus, the self-respect movement occupied the space which is designated by the Cambridge school as the social/the cultural and not the political. Given this, the history of the movement was constituted in the writings of the Cambridge school primarily by its absence.¹

However, the self-respect movement surfaced in their accounts, but mostly for reasons other than itself. Washbrook, for instance, allows the movement a brief entry in his text where it serves as a mere heuristic device to affirm the Justice party as being devoid of any ideological foundation:

...it would be impossible to connect the non-brahman movement of the 1912 to the anti-religious Tamil self-respect movement of the later 1920s... The self-respect movement rested on the support of these elements of local level culture which were slowly being drawn into the regional level cultures... when, from the 1920s, the self-respect movement began to emerge, it attacked all groups of state-level culture, brahmans and non-

brahmans alike, and thus made enemies of the high-caste leaders of the non-brahman movement of the earlier period. In social composition, practical aims and doctrines, the non-brahman and self-respect movements were as different as chalk and cheese [Washbrook 1977:278].

Baker gives a slightly longer account of the movement, perhaps because it took place exactly during the period of his study. He writes,

in the late 1920s it [self-respect movement] had gained notoriety through attempts to force the entry of depressed castes into temples and through public ridicule of Hindu texts which, the self-respecters argued, promoted an oppressive brahmanical code, and they had gained considerable support through a series of carefully staged conferences. Yet their dependence on the patronage of certain leading Justice politicians had ensured that the movement's radicalism remained mostly rhetorical. In the 1930s, however, the movement took deeper root in some of the towns that were being most deeply disturbed by economic change. At its annual conference in May 1930 at Erode, the movement acquired a programme which went beyond the attack on priestcraft and religious obscurantism and included equal civil rights for depressed castes and for women and measures to redistribute wealth within society... In 1932, he [Periyar E V Ramasamy] visited Europe and Russia and returned, to the astonishment and horror of his old Justice friends, as a fervent bolshevik. He preached revolution throughout Tamilnad, erected a 'Stalin Hall' to house a self-respect conference in Coimbatore, and gave the Self-Respect movement the litany that 'capitalism, superstition, caste distinctions and untouchability must be rooted out'. In 1934, government started to bring him to heel. They jailed him for a seditious article which, among other things, accused the Justice ministers of 'sharing the spoils' of government, arrested him again for conniving in the publication of a revolutionary pamphlet, and when they started in early 1935 to mop up all pinkish organisations in the province, forced him to a recantation of his bolshevik views [Baker 1976:192-93].

For Baker, this trajectory of events which marked the career of the self-respect movement was merely a product of the disturbed times produced by the great depression and the consequent disruptions in patron-client nexuses.

II

Our critique of the Cambridge school's mode of invalidating caste identities as part of the political and the resultant delimiting narrative of the dravidian movement(s) has to begin with an understanding of how far the voices of the participants in history are

allowed to resonate its narratives. In other words, following Renato Rosaldo's (1990:104) critique of E P Thompson, our question is, "...whether central concepts [in our case, used by the Cambridge historians] belong to the author or to the agents of historical change." As we have seen earlier, the historiography of the Cambridge school devalued what was enunciated by the participants in history and instead deduced their intentions from the so-called outcomes of history. That is, utterances are denied the status of conscious acts and are treated as though they are without any autonomous domain of influence. Moreover, outcomes become outcomes only if they meet the requirement of instrumental reason. The implication of such mode of history writing is not difficult to discern. By paralysing the voices of the participants in history, it leaves no space for them to represent themselves [O'Haulon 1985:307]. In other words, there can be no more histories other than what the Cambridge school designates as history.

Despite such theoretical closures and totalising impulse, the Cambridge historians' own writings are full of fissures and slippages which give away the surplus of historical processes which their framework could not accommodate and hence erased or written out. This surplus of history which awkwardly surfaces in their texts, only to be suppressed with swiftness, offer us the limits of their historiographical practice.

Let us first begin with how the Cambridge school expels caste identities from their accounts. As we have noted, their first move towards this was to reinscribe the relationship between the brahman and the non-brahman as non-antagonistic by means of foregrounding and privileging the non-brahman's desire to sanskritise. However, as they proceed with their story, what is represented as non-antagonism refuses that characterisation and articulates itself in opposite terms:

All members of the western-educated community now were placed in the same career structure and single lines of division between them could split the presidency. That these lines might come to mark a brahman/non-brahman division is suggested by a common grievance which all educated non-brahmans shared against brahmans. Their accredited social position was disproportionately low for, although they were performing the same secular roles as brahmans, they were seldom accorded the same ritual and social prestige. Niggling complaints against brahman arrogance which no doubt could have been heard in separate localities before, began to creep into the provincial press [Washbrook 1977:280-81].

Here, Washbrook's account, for example, coheres with the account of the Justicites themselves. That is, even their advancement

in education and employment did not subvert their inferiorised identity:

Many are the non-entities that live by eating the bread and wearing the clothes we give them and yet call us Sudras without any difference... All our sastras declare that there is but one Sami (God). But in our Dravida Country all Brahmins are samis (Gods). The man who, in hotels, cooks and serves our meal is a sami; the man who supplies drinking water on the railway platform is a sami; the man who sells sweets is a sami and the man who cringes for alms is also a sami... There is no reason whatever to call an idiotic and obstinate Brahman a sami. Therefore let our students and other Tamilians give up from today the bad practice of greeting the Brahman as sami [Dravidian, July 12, 1917, quoted in Rajaraman 1988:60].

Washbrook was quick to marginalise such possibility of brahman-non-brahman antagonism, which, at a weaker moment of the text, almost allowed the Justices to speak for themselves. Washbrook immediately invokes images of non-antagonism and notes, "The importance of this union of complaint, however, ought not to be over-emphasised. It is not necessary to like someone in order to work with him, and most of the people who were making the complaints were in fact working with brahmins and were tied to the same magnate networks as brahmins." Thus, the "union of complaint" of the non-brahmins could not find their elaboration within the framework of the Cambridge school and awaits its history outside.

The second critical move of the Cambridge school in invalidating caste identity is through a representation of caste as irredeemably fragmented. We have already seen this in detail. But, as Washbrook proceeds to establish the so-called non-antagonism between the brahman and the non-brahman as a generalised feature of caste system as such in colonial Tamil Nadu, his tightly woven argumentation of fragmented castes hits its limits. He flounders when he notes, "...The majority of Southern sub-regional *varna* were gathered in and around the Sudra Sanskrit *varna*; Thus social mobility between them was possible without crossing any very obvious and contentious ritual gap" [Washbrook 1977:129]. However, for him, this sudra identity in no sense signifies the possibility of caste being an unifying identity. He displaces such possibility by reading once again non-antagonism and fragmentation there: "In Madras, more than anywhere else in India, small groups were able to raise their effective social status without causing disturbance to the prevailing status structure and without mobilising other groups or endogamous units either in the status categories which they were leaving or in those which they were entering" (1977:129). Washbrook's evasion of the unifying dimension of sudra identity salvages

the Cambridge school's denial of horizontal unities in Indian politics. Despite this evasion, it was indeed the inferiorised sudra identity which constituted the basis for the mobilisation of the non-brahman by the dravidian movement(s). While the Justice party recognised that "Many are the non-entities that live by eating the bread and wearing the clothes we give them and yet call us sudras...", it became a keyword, perhaps the most important keyword, in the self-respect movement's discourse on caste. That history of possible unity based on caste identities, which is consciously written out by the Cambridge school, needs to be written in.

The third move of the Cambridge historians towards disinvesting identities of substance is to denude the political of the influence of ideas. They, as we have noted earlier, conceptually separate the social and the cultural from the political; and ghettoise ideas in the former. As the Cambridge school's narrative of history unfolds, the separation of spheres, however, comes under strain and sets the limits for what could be their version of history; and the repressed ideas return surreptitiously. An interesting illustration here will be Washbrook's portrayal of G Subramania Iyer's political career:

G Subramania Iyer had been a prominent nationalist agitator in the 1870s and 1880s... But he had quarrelled with his colleagues over social reform and had virtually outcasted himself by allowing his widowed daughter to remarry. As a result he had been excluded from the inner sanctum of Mylapore, he had failed to be made a Congress president - which his work for the early Congress deserved - and he had been unable to enter the tight world of legislative council and bureaucratic politics. Through the 1890s and early 1900s, he remained a penurious publicist, while his previous associates became powerful politicians [Washbrook 1977:245].

Thus, one of the most promising members of the Mylapore faction lost his share of colonial patronage for taking up social reform. In other words, his marginalisation in the Cambridge school's version of the political is a result of his stance in the so-called social. But Washbrook has to bypass such interrelationship between the so-called social and the political so as to keep his framework intact, and he does. Instead of exploring the interface between the social and the political, he displaces one's attention on to Iyer's later political style: "In 1907, he aimed his polemics against Mylapore and drew a following from young and poor members of the intelligentsia, students, mill workers, 'jutkawallahs' and other similarly frustrated elements..." [Washbrook 1977:245].

While what Washbrook displaces or does not analyse about Subramania Iyer tells us about the need to write a different history

by accommodating the role of ideas and breaching the boundary between the social and the political, what he writes of Iyer's political style too affirms the need for a different history. That is the history which was not informed by Cambridge school's instrumental reasoning alone, but also informed by the politics of jutkawallahs et al, who are disparagingly characterised as people without any political agency, "Jutkawallahs, subject to constant police harassment, factory hands, in the difficult state of assimilation into an urban proletariat, and students, without material worries, could be drawn into violent demonstrations *without much difficulty and particular cause*" [Washbrook 1977:249; emphasis mine].

III

There are voices within the Cambridge historians' texts which are kept subordinated and await articulation and elaboration. These voices viewed caste identity as sites of oppression and hence of unity. To recover these voices is to recover the surplus of history which the Cambridge school's historiography shuts out.

The first move towards recovering these voices is to have a critical understanding of the authorised colonial public sphere, which is valorised by the Cambridge school as the site of the political. Of colonial south India, for instance, Washbrook writes,

'Government' was omnipresent in the life of colonial South India. Whether we examine the newspapers, the letters, the autobiographies, the pamphlets or the books of the period, repeatedly we find references to the power, promise and peculiarities of the entity known as government. The avaricious begged its favour, the ambitious its confidence, the pious its protection and the nationalists its self-destruction [Washbrook 1977:23].

Similarly, for Baker, his period of study is a period of "councils, ministers, and electorates" (1976:xi).

Despite such descriptions by the Cambridge school which foregrounds the colonial public sphere, the government-native interaction under colonialism did not and could not approximate anywhere close to even the bourgeois public sphere, 'a sphere which mediates between society and state, in which the public organises itself as the bearer of public opinion' [Habermas 1974: 49]. First of all, this sphere of politics was based on the denial of citizenship for the colonised, a necessary condition for colonialism as a system of domination to sustain itself. Given this, the authorised colonial public sphere was confined to a thin layer of the colonised, that is, sections of the indigenous elite. Take for example, the legislative council election of 1920 in Madras province. Even according to Baker, 'In any event it did not take many votes to win an

election. A million and a quarter qualified for the franchise... and these were divided into 25 district constituencies. The turn-out in rural areas was very low, averaging 23.8 per cent throughout the province, and thus three to four thousand votes were enough for victory. The best strategy for a candidate was to win the support of men who could command many votes in a locality...' (1976:35-36).⁶ And even this elite was rendered largely inarticulate by means of colonial laws such as the press acts.

As much as the colonial public sphere was a narrowly constituted sphere based on wealth and education, it too was constituted by the logic of co-optation. Washbrook's neo-colonial reading of this sphere brings this out clearly: 'By the 1910s, the classic colonial model of imperial master and native subject was rapidly losing its appropriateness in the context of the Madras state system. Indians were involved actively as well as passively in the highest processes of government' (1977:61).

The colonial public sphere was restricted in its scope and substance not merely because of the dynamics of colonialism, but also by the very character of the indigenous elite who participated in it. Without being informed by notions of substantive citizenship, it was an elite who were, by and large, unwilling to relinquish their traditional modes of semi-feudal authority, and hence failed to speak for a broader public. 'The upper castes, especially the Brahmins found that their intelligence and application brought them rich rewards but at the same time did not entail any obligation which would run counter to their traditional ways of living. They could live comfortably [uncomfortably?] in two worlds, the secularised, modernised atmosphere of their places of work which did not affect their everyday domestic and social life. The law along with teaching and the civil service were professions which they could well adopt and yet not infringe their caste and ritual prohibitions' [Srinivasan 1970:184; see also Pandian 1994:2-4].⁷

The implication of this dual existence of the elite participants in the colonial public sphere can be understood in terms of what Nancy Fraser (1992:131-32) writes about the private-public divide: 'The rhetoric of domestic privacy would exclude some issues and interests from public debate by personalising and/or familialising them; it casts these as private, domestic or personal, familial matters in contradistinction to public, political matters. The rhetoric of economic privacy, in contrast, would exclude some issues and interests from public debate by economising them; the issues in question here are cast as impersonal market imperatives... In both cases, the result is to enclavise certain matters in specialised discursive arenas and thereby to shield them from broadly based debate and contestation.

This usually works to the advantage of dominant groups and individuals and to the disadvantage of their subordinates.' In the context of political elites in colonial Tamil Nadu, the privacy was not merely domestic or economic, but more inclusive so as to accommodate issues of religious and caste practices; and hence its disempowering implications were more acute and expansive.

Importantly, this already restricted and qualitatively insubstantive colonial public sphere was further narrowed – this time, discursively – by the Cambridge school. The contestations and alternate points of view which got expressed, in whatever limited manner, in this sphere were erased by merely recruiting those events, which can be interpreted by means of instrumental reasoning, as political, and by denying any validity to participants' self-representations. Thus, the sphere was represented as homogeneous, with its tensions being characterised as nothing other than unprincipled scramble for colonial patronage. We shall return to this point a little later.

The problem of confining the political to this authorised colonial public sphere by the Cambridge school will become evident as we compare it with bourgeois liberal public sphere of the west, which was founded on a more accommodative (though by no means free from problems) notion of citizenship compared to the colonial situation. The point to be underscored here is that, even the bourgeois public sphere could not accommodate the politics of the subordinated. For example, Fraser, in a sympathetic critique of Habermas, notes, '...the problem is not only that Habermas idealises the liberal public sphere but he fails to examine other, non-liberal, non-bourgeois, competing public spheres. Or rather, it is precisely because he fails to examine these other public spheres that he ends up idealising the liberal public sphere' [Fraser 1992:115; see also Eley 1990 and 1992]. Proceeding further, she elaborates her point thus: '...members of subordinate social groups – women, workers, people of colour, and gays and lesbians – have repeatedly found it advantageous to constitute alternative publics. I propose to call these subaltern counterpublics in order to signal that they are parallel discursive arenas where members of subordinate social groups invent and circulate counterdiscourses to formulate oppositional interpretations of their identity, interests and needs' [Fraser 1992:123]. One need not belabour the point that this critique of the bourgeois public sphere will apply, in a more acute fashion, to the colonial public sphere, which is qualitatively and otherwise restricted in scope, under the domination of the colonial state and based on the denial of citizenship to the colonised. In the rest of the article, I will suggest how the category of subaltern counterpublic can recover those histories of caste identities and of dravidian movement(s), which fell victim

to Cambridge school's historiography.

Our explorations into the histories and the politics of subaltern counterpublics, which are rendered voiceless by the Cambridge historians by *assuming* their politics as that of clients without will, has to begin outside the colonial public sphere.⁸ To step outside the colonial sphere which was institutionalised in "councils, ministers and electorates", is to step into a sphere saturated with the politics of everyday life, where caste, among other inferiorised identities, was experienced. It was a sphere populated with 'agraharams' which denied access even to depressed class members of the legislative council [Chandrababu 1993:4]; temples which kept lower caste devotees either outside or at a distance [Hardgrave 1969:30, 121-5]; railway restaurants which had separate dining arrangement for brahmins (as late as 1941); hotels which did not entertain non-brahmins; private buses which did not permit depressed classes to travel [Chandrababu 1993:73,83]; men who, given their lower caste status, were denied the "right to ride a bicycle on the public street of the village, to eat in the coffee hotel, to conduct marriage procession, and often even for a presumptuous... boy to attend the village school [Hardgrave 1969:160; emphasis mine]. Thus, in this domain, caste as well as other inferiorised identities were inescapably present as experience." We may mention here, the self-respect movement functioned exactly in such a domain outside the authorised colonial public sphere. As a Congress weekly *Desabandu* put it in 1929:

Everyday the nuisance created by the self-respecters increases beyond tolerance. In trains, hotels, river and tank-beds, on the roads and everywhere they seem to be active. They have been charging in abusive language the Brahmins, religions, temples, idol worship, incarnations, *puranas* and *itihasas* and... religious marks or symbols [Chandrababu 1993:132].

And the public speeches, pamphlets, literature and newspapers of the self-respecters spoke incessantly of experience of caste oppression, which is in sharp contrast to Washbrook and Baker who found government everywhere. Recovering such politics of experience will be our first move towards recovering identities as part of the political.

But experiences of oppression do not in themselves automatically constitute a public based on a common identity; it is instead formed through multiple and complex mediations. Writing of public sphere, Eley gives us a feel of such mediations:

The public sphere ... derived only partly from the conscious demands of reformers and their articulation into government. More fundamentally, it presumed the prior

transformation of social relations, their condensation into new institutional arrangements and the generation of new social, cultural and political discourse around this changing environment. In this sense, conscious and programmatic political impulses emerged most strongly where underlying processes of social development were reshaping the overall context of social communication. The public sphere presupposed this larger accumulation of socio-cultural change [Eley 1990:14].

Such conceptualisation affirms a number of things which are denied by Cambridge historians. Firstly, it collapses the separation between the political and the socio-cultural and establishes their interdependence as part of a wider notion of the political. Second, it shows that identities are not pre-given, but are constituted over time through a range of processes. In other words, one has to write the histories of how identities are formed as part of the political, instead of looking for them as pre-existing categories of politics – as Cambridge historians have done in denying validity to caste. Finally, it recovers the enunciation of ideas as an important part of publics as well as of the process of such publics being constituted.

Within this conceptualisation of how experiences of oppression, through complex mediations of words and deeds, arrive at subaltern counterpublics, we can now address a range of questions about caste identities and the history of the dravidian movement(s), which have been silenced by Cambridge historians. For instance, if Baker and Washbrook constitute the history of the self-respect movement primarily by its absence, it is now possible to unravel the story of how the movement began its campaign against brahmanism by working initially through associations of different castes, attempted with time a non-brahman front on the basis of the common sudra identity, and finally arrived at a critique of caste system as such [Kesavan 1990:79-81], and how its campaign was carried to even small towns and villages through numerous journals such as *Kudi Arasu*, *Revolt*, *Vedikundu*, *Tamilan*, *Kumaran*, *Puthuvai Murasu*, *Chandamarutham*, and *Suyamariyathai Thondan* [Kesavan 1990:128], countless books and pamphlets which included translations of Robert Ingersoll's rationalist/positivist writings and the publications of the London rationalist association [Chandrababu 1993:131-35, 149], staging of plays (ibid:127-29), a battery of public speakers whose skill is much remembered and spoken of even today, and reading rooms and gymnasia located in different parts of the Tamil-speaking areas. It will, among other things, be a history of utterances whose materiality is mere fiction for the Cambridge historians. Such recovery of self-representation will give us a different account of the authorised colonial public

sphere too. Debates within it will no longer signify merely instrumental reason, but ideology as well. Thus, we can situate the conflicts between the Justice party and the Congress in a broader realm of politics which accommodates ideas as part of the political.

If the Cambridge school fails to find caste identities because it treats them as pre-given, its privileging of incomplete mobilisation based on caste identities (caste as fragmented) as a means to represent caste as non-political, too would get a different reading. Here, one needs to bear in mind that one is talking of publics and not communities:

‘...the concept of public differs from that of a community. “Community” suggests a bounded and fairly homogeneous group, and it often connotes consensus. “Public,” in contrast, emphasises discursive interaction that is in principle unbounded and open-ended, and this in turn implies a plurality of perspectives. Thus, the idea of a public can accommodate internal differences, antagonisms and debates better than that of a community [Fraser 1992:141n].

This open-endedness of publics basically means that they not only unify participants towards a consensus, but also simultaneously allow for dissensions. In publics which are constituted on the basis of specific identities, these dissension will, at an important level, be based on the problems arising out of the criss-crossing of several identities which define the participants contingently in the publics – caste, class, gender, language etc. In short, publics will ever be marked by fragmenting and unifying tendencies and the mobilisation will always remain incomplete. This site of incompleteness will be the site to explore the totalising or non-totalising character of publics in terms of how inclusive its conception of politics is, rather than a site to deny identities and horizontal mobilisation any role in the political, as has been done by the Cambridge school [Wolpe 1988]. Thus recuperating identities, we can now, in the specific context of the dravidian movement(s), raise issues like how far the sudra identity unified while other identities such as class set the limits for the movement(s); in what manner the politics of the self-respect movement which problematised several identities based on caste, gender and religion, came into conflict with the Justice party, which foregrounded merely the caste identity, and the Congress, which waited for independence to talk at all of inferiorised identities in any substantive manner.

Our account gives the impression that subaltern counterpublics are discrete and have nothing to do with the authorised colonial public sphere – a separation which seems similar to Cambridge school's separation of the social and the political. But they are not: while they are characterised by their own autonomy, they also influence and

get influenced by other publics. To quote Nancy Fraser:

I am emphasising the contestatory function of subaltern counterpublics in stratified societies in part to complicate the issue of separatism. In my view, the concept of a counterpublic militates in the long run against separatism because it assumes a *publicist* orientation. Insofar as these arenas are *publics*, they are by definition not enclaves, which is not to deny that they are often involuntarily enclaved. After all, to interact discursively as a member of public, subaltern or otherwise, is to aspire to disseminate one's discourse to ever widening arenas [Fraser 1992:124].

This imbrication of spheres is where one can write the history of contestations and collaborations among different political formations, some functioning in the colonial public sphere and others outside: why E V Ramasamy, the founder of the self-respect movement, supported the policies of the Justice party even as he was then a Congressman; why the self-respect movement attacked the Justice party for its compromises for the sake of power, even while it endorsed a part of its agenda; why the Justice party had to endorse the agenda of the self-respect movement as it was losing grip over the colonial public sphere; why the Justice party leader W P A Soundarapandian, under the influence of E V Ramasamy, took to the programme of ‘desanskritising’ the already ‘sanskritising’ Nadars and ‘Harijan’ welfare. Cambridge school's valorised colonial public sphere becomes thus only a part of the political and not the whole. Further, no longer can one write its history without the history of what lay outside it.

Such dialogics of the publics, subaltern or otherwise, return the mind to history, return inferiorised identities as a basis of contestatory politics; and provide a space to recover the history of the dravidian movement(s) both in and outside the logic of instrumental reason. In other words, what is repressed by the Cambridge historians can now return to the centre-stage of the political. After all, such dialogics was pervasive, as the sigh of relief which M P Sivagnanam, in his role as a Congress harijan seva sangha propagandist, experienced in the early 1930s will show us:

In those days, the self-respect movement had good influence among the educated harijan youths of Madras slums. Several of them took E V Ramasamy's words as sacred. Because of that, some of them would barge into my meetings and pose questions. They would insist on an answer. Due to these troubles, [I should say] my good opinion of the Self-Respect Movement suffered. But, as I was in charge of Harijan Seva Sangh publicity only for a year, I was relieved from the troubles of the Self Respecters soon [Sivagnanam 1974:85].

Notes

[An earlier version of this paper was presented at the Thirteenth European conference on South Asia, held at Toulouse, August 30-September 1, 1994. I am grateful to the participants in the conference and Anandhi S, Venkatesh Chakravarthy, J Jeyaranjan, A S Paneerselam, Jean Racine, Padmini Swaminathan and A R Venkatachalapathy for their comments which helped me in revising it.]

- 1 If I confine myself to caste identity alone in this paper, it is because that alone was taken up for analysis by Washbrook and Baker. This, however, does not mean that the dravidian movement(s) did not address the question of other identities. In fact, the self-respect movement strand of the dravidian movement(s) took up issues of gender, religion, language and nation, apart from caste [see: Anandhi 1991; Pandian 1993; Pickering 1993; and Venkatachalapathy 1990].
- 2 We may note here that, for Washbrook, 'Brahman dominated hierarchy' is not a problem of power and powerlessness/domination and subordination.
- 3 Another way in which the Cambridge school reduced caste as a mere idea is by representing it as a fiction invented by the colonial state on the basis of misrecognition of Indian reality [Baker 1976:176; and Washbrook 1977:269]. This has been already pointed out by O'Hanlon (1985:307) in her critique of Cambridge historians.
- 4 The discursive separation between the social and the political has different biographies in colonial India and these are yet to be recovered in history writing. For instance, while oppositional movements played upon the distinction and self-represented themselves as located in the social so as to guard their politics from the colonial authority, the colonial state, given its ideological baggage of 'civilising' the colonised, responded less ruthlessly towards the so-called social movements.
- 5 The self-respect movement was launched by E V Ramasamy, after he broke ranks with the Indian National Congress. His active sojourn in the Congress came to an end in November 1925 when two of his resolutions seeking 'communal representation' were disallowed in the Kancheepuram conference of the Tamilnad Congress. Thereafter, he declared his political agenda to be 'no god, no religion, no Congress, and no Brahman'. [Chidamparamanar 1983; Visswanathan 1983; and Arooran 1980].
- 6 Even if one concedes that mobilisation in elections was vertical, the poor turnout figure given by Baker himself shows the limits to such mobilisation. Often, such poor turnout in elections is read as lack of citizenship ideals among the natives. In fact, it was not and they indeed had constituted other sites to articulate their politics [Sabata 1992].
- 7 Perhaps, Stoddart's following description will give us a flavour of the divided self of the political elite participating in the colonial public sphere:
S Srinivasa Iyengar, Congress President for 1927, returned from Gauhati to be greeted by 'Vedic Brahmans from Mylapore and Triplicane who offered *purnakumham*...and chanted one or two vedic hymns appropriate to the occasion.' At about the same time S Satyamurti, an important Brahman Congressman and lieutenant of Srinivasa Iyengar,

acted as chief defence counsel for the Thiruvana-malai temple authorities against J S Kannapar, editor of the Justice newspaper *Dravidian*. Kannapar charged the Brahman temple authorities with having unlawfully prevented him from entering the temple. M K Acharya, a swarajist member of the Central Legislative Assembly, became involved in the issue of social reform, notably the proposed legislation relating to civil marriages and the age of consent to marriage. During 1926 he had founded the Brahmana Maha Sabha, which actively opposed social reform, and its meetings were chaired frequently by CV Venkataramana Iyengar, yet another prominent Brahman swarajist [Stoddart 1975:53].

8 According to Ranajit Guha (1992:305), 'With the subaltern domain surgically removed from its system, all initiative other than what emanates from the colonisers and their collaborators strictly ruled out, all elements of resistance meticulously expelled from its political processes, colonialism emerges from this historiography as endowed with a hegemony which was denied to it by history' [see also Guha 1982:5-6].

9 In foregrounding experience, I have no intention of treating it as prediscursive. As Joan Scott (1991:797) has argued, 'Experience is at once always already an interpretation and something that needs to be interpreted. What counts as experience is neither self-evident nor straightforward; it is always contested and always therefore political... Experience is, in this approach, not the origin of our explanation, but that which we want to explain. This kind of approach does not undercut politics by denying the existence of subjects; it instead interrogates the process of their creation...' Such an understanding of experience does not evict what the Cambridge school denigrates as "ideational" or "matter of psychological perceptions" from the analysis of the political, but instead treats it as an important part of the political.

Alternative Approaches to Locating the Food and Nutrition Insecure

Work in Progress in South India

Lawrence Haddad

Kimberly Chung

P Yasoda Devi

This paper reports on the design of a multidisciplinary, collaborative project intended to make food and nutrition security systems more viable. The objective of the project is to identify 'alternative' indicators that can be used in food and nutrition monitoring and evaluation systems.

ALTHOUGH India contains at least 215 million hungry people [Gopalan 1992], Indian famines are a 'nightmare of the past'. Famine mitigation has been due to the combination of a number of factors: food production which has kept up with population increases, government buffer stocks of grain which have stabilised foodgrain prices, democracy and a free press to give the rural poor a voice, the existence of relatively efficient inter-regional grain markets, the availability of informal consumption credit, and a set of explicit famine-relief policies such as rural public works programmes [Dreze 1988; Bidinger et al 1990]. While this array of food policy instruments has proved effective in helping to averting acute undernutrition, many economists – inside and outside the government of India – feel that the current level of food security could be achieved with less strain on public expenditure if policies were more targeted to the undernourished [Government of India 1990; Ravallion and Subbarao 1992; Jha 1992; Dev, Suryanarayana and Parikh 1992, Bapna 1991; Harriess 1991].

The economic policy reforms currently underway in India are likely to provide the government with greater incentives to raise the cost-effectiveness of social sector spending. Public sector expenditure on poorly targeted programmes will become less easy to justify on economic grounds in the face of fiscal austerity measures that typically accompany economic reform packages [Parikh 1992].

One means of potentially raising the cost effectiveness of food security programmes is to target programme resources to households and villages according to the policy objective being pursued. For example, a familiar strategy is to minimise the severity or depth of undernutrition by targeting the most severely undernourished. If the objective is to minimise the incidence of undernutrition, then the optimal strategy is to target all individuals just below the food poverty line [Ravallion 1990]. Another way of improving cost-effectiveness is to

monitor food security during the course of programme operations. This enables programme design to be more responsive to the changing causes and patterns of undernutrition.

These calls for more targeted and flexible approaches to the promotion of food security are not easily addressed. There are several reasons for this. First, targeting is politically controversial. Eligibility criteria can create incentives among those who administer programmes to 'rent-seek' by taking advantage of unenforceable criteria. Eligibility criteria can also provide incentives for households to misrepresent their circumstances, such as reporting female-headship when this is not the case [Jain 1992]. The unpopularity of those who write eligibility criteria into law and are charged with administering them can have political consequences, particularly since the non-eligible are likely to be the more politically powerful. Finally, the very term 'targeting' has become politically charged, in large part due to the family planning drives of the 1970s in which targeting was interpreted in terms of the number of individuals touched by a programme rather than whether or not those individuals would have benefited most from the programme [Gupta et al 1992].

Second, even if an accurate and inexpensive indicator of undernutrition were found, targeting and monitoring can still be costly. Specifically, both require the regular collection of accurate and timely data on household food security, an activity that may cost more than the savings promised by targeting. Moreover, for an indicator to be integral to undernutrition reduction schemes, the information generated must be acted upon. If the associated interventions prove to be expensive to execute, then the tradeoff between the costs of indicator collection and the benefits of the indicator collection are even more uncertain [Haddad, Kennedy and Sullivan 1991].

Therefore, given political will, the cornerstone of a viable monitoring system

is the identification and use of indicators that are valid and reliable and yet straightforward and inexpensive to collect and analyse. This is one of the lessons derived from the last 10 years of experience with food and nutrition monitoring and surveillance systems world-wide [Tucker et al 1989]. However, a recent global inventory of food security and nutrition monitoring systems indicates that policy-makers and implementors in developing countries have found many of the recommended 'traditional' indicators difficult to incorporate into ongoing information systems [Kennedy and Payongayong 1991]. Too often indicators are laborious and expensive to collect, difficult to analyse and interpret, and of limited use in early warning or targeting related policies.

Project Objectives and Overview

For this work we define food security as a state in which there is an availability of sufficient food at all times for all people to ensure an active and healthy life. Sufficient food refers to both the quantity and quality required for good health. The term 'food security' has been used at the national, regional, community, household, and individual levels [Maxwell 1990]. The research reported here will aim to develop food security indicators at the household, individual, and village levels.

Nutrition security is defined as the appropriate quantity and combination of inputs such as food, nutrition, and health services, and caretaker's time, to ensure an active and healthy life at all times for all people. Food security, therefore, is a necessary, but not sufficient, condition for nutrition security. Nutrition security indicators will be developed at the individual level.

Given these definitions, the overall objective of this study is to field test and document the validity and reliability of alternative indicators of food and nutrition

FIGURE 1: OVERVIEW OF ALTERNATIVE INDICATORS PROJECT

security in the Indian semi-arid tropics (ISAT). The proposed set of indicators will include biological and socio-economic variables that are typically collected by international or national research stations, as well as some easily collected alternative indicators.

Supporting objectives include:

- (1) To assess the ability of a set of 'generic' indicators (indicators which are not unique to a particular setting) to locate food and nutrition insecure households, women, and pre-schoolers in the ISAT.
- (2) To develop a set of generalisable guidelines for identifying indicators which are 'unique' in locating food and nutrition insecure groups in the ISAT, and to identify that 'unique' set.
- (3) To assess the ability of the 'unique' indicators to locate the food and nutrition insecure, particularly in relation to the 'generic' set.
- (4) To assess the costs of collecting the 'generic' and 'unique' indicators and to determine a set of 'location specific' indicators which are both accurate and cost-efficient in locating the food and nutrition insecure in the ISAT.

The Alternative Indicators Project was initiated through an extensive literature survey on indicators of food security. In turn

this review informed an empirical analysis of extant data from seven different settings from four countries (Brazil, Ghana, Mexico, and the Philippines).

The literature review and the empirical analysis generated a set of alternative indicators that were successful in locating the food insecure in a number of different settings. Because of their generalisability, this group of indicators is called the 'generic' set. Although many of these

TABLE 1: TIMING OF SURVEY ROUNDS IN STUDY VILLAGES

FIGURE 2: CONCEPTUAL DIAGRAM SHOWING THE RELATIONSHIP BETWEEN GENERIC, UNIQUE, AND LOCATION SPECIFIC INDICATORS OF FOOD AND NUTRITION SECURITY

Indicator set A: Generic indicators that do *not* work well in terms of ability to locate the food insecure at low cost in the four villages.

Indicator set B: Generic indicators that work well in terms of ability to locate the food insecure at low cost in the four villages.

Indicator set C: Indicators unique to the four villages which work well in terms of ability to locate the food insecure at low cost.

Indicator set D: Indicators unique to the four villages work well in terms of ability to locate the food insecure but NOT at low cost.

indicators may be able to locate the food and nutrition insecure in the ISAT, the usefulness of each generic indicator for this area may only be determined through field testing. Field testing may also reveal a set of indicators which are 'unique' to the study area. Such indicators may perform well in certain regions, but have little meaning elsewhere. In India a possible example of a unique indicator might be 'caste' or 'number of male children'. Finally, the most appropriate set of indicators is determined by the cost-effectiveness of putting the indicator into use. Since cost of indicator collection will vary by location, the set of cost-effective indicators are called the 'location-specific' indicators. This set may contain indicators

which are either generic or unique. Above all, however, these indicators are both accurate and cost efficient.

Figure 2 shows a conceptual representation of the three sets of indicators. The generic and unique sets are shown to be mutually exclusive but variables from either set may be cost-efficient. This set of accurate and cost-efficient indicators forms the 'location-specific set'. It is this set that forms the basis for cost-efficient targeting and monitoring.

In terms of generic indicators, the literature review suggested a number of relatively simple indicators which have proved effective in locating and tracking the food insecure. The central message of the empirical analysis reinforced this conclusion. Compared to more complex indicators, such as household income level, indicators such as number of unique foods consumed, region, dependency ratio, household size, rooms per capita, incidence of illness, vaccination status, age at weaning, drinking water and sanitation facilities – all coded with only two or three different values – were able, either singly or in combination, to identify households and pre-schoolers at risk. The indicators that located food insecure households in several data sets from developing countries are:

- Household size
- Dependency ratio
- High percentage of pre-schoolers
- Region
- Rooms per capita in home
- Quality of drinking water and sanitation facilities
- Land area cultivated and owned (in rural areas)
- Occupation/tenancy status
- Number of unique foods consumed or available
- Subjective perceptions of participant as to quality of diet

Indicators that located nutrition insecure households in several data sets from developing countries include:

- Age of pre-schooler (low for low wt/ht z-score, high for low ht/age z-score)
- Incidence/duration of illness (self-reported)
- Vaccination records
- Improved water and sanitation facilities
- Use of improved fuel for cooking
- Characteristics demanded in food
- Households' opinion about quality of diet
- Number and type of unique foods consumed
- Region
- High age of weaning
- Income from remittances
- Dependency ratio
- Crop-tenancy status of household
- Number of income sources.

TABLE 2: SUMMARY STATISTICS FOR STUDY VILLAGES

Characteristic	Aurepalle	Dokur	Shirapur	Kanzara
Location	Mahabubnagar, Andhra Pradesh	Mahabubnagar, Andhra Pradesh	Sholapur, Maharashtra	Akola, Maharashtra
Distance from Hyderabad	70 kms south	125 kms south	365 kms west	528 kms north-west
Rainfall (general) ^a	Unassured; 630 mm	Unassured; 630 mm	Unassured; 630 mm	Assured; 890 mm
Total rainfall in 1992 (monthly standard deviation)*	428 mm (38.72)	578 mm (57.11)	319.4 mm (36.17)	450.6 mm (94.78)
Soils ^a	Red Soil; Low water retention	Red Soil; Low water retention	Deep black clay soil; High water retention	Medium deep black clay soil; Medium water retention
Major crops ^a	Kharif sorghum, pearl millet, castor, paddy, pigeon pea, groundnut	Kharif sorghum, pearl millet, castor, paddy, pigeon pea, groundnut	Rabi sorghum, pigeon pea and minor pulses	Cotton, sorghum, mung bean, pigeon pea and wheat
Number of households in 1975 ^a	476	313	297	169
Number of households in 1989-90 ^a	664	464	451	292
Per cent labourers ^a	31	24	33	32

FIGURE 3: MAP OF THE STUDY SITE

Source: Walker and Ryan (1990)

II Project Site

The ICRISAT villages are not located in the most undernourished states in India. However, the villages provide a unique opportunity for the study of rural food security. The Alternative Indicators Study is able to take advantage of (i) the high level of trust between the villagers and ICRISAT enumeration team; (ii) the accumulated human capital of the ICRISAT enumeration team; and (iii) the longitudinal series of data on consumption and income which constitute the Village Level Studies (VLS) data [Walker and Ryan 1990].

The longitudinal dimension is important for the indicators analysis because food and nutrition monitoring systems have two important functions:

- (1) Identification of the food and nutrition insecure;
- (2) Identification of those households or individuals that move in and out of this classification over time.

The two functions are, of course, interrelated, to the point that the definitions of food and nutrition security become contentious. For example, consider two households: Household 1 falls below the undernutrition line one-out-of-four times over a two-year period; and Household 2, which does not fall below the line, but has a lower average caloric adequacy than

falling below that threshold. Under the first definition, Household 1 is classified as more food insecure, but under the second and third definitions, it is ambiguous which household is more food insecure. If only cross-section information is available, only the first definition of food security can be utilised. Moreover, the classification of Household 1 as food secure or insecure will depend on its caloric adequacy at the time of the cross-section. These definitional considerations are extremely important in regions that experience severe seasonality.

PAST DATA COLLECTION EFFORTS

The six VLS villages have been the subject of study for almost 20 years at ICRISAT. Past studies can be grouped into three categories: (1) the 'Old VLS' studies; (2) the 'New VLS' study; and (3) the 'Six Village Nutrition Study'. The Old VLS data constitute an economic time-series collected from three villages over a 10-year period, 1975-85 (Aurepalle, Shirapur and Kanzara) and three villages over a period of two years (Dokur, Kalman and Kinkheda). The Six Village Nutrition Study consists of four enumerations of nutrition information during 1977-78 on the Old VLS sample. The New VLS data consist of three enumerations of economics data on an overlapping sample of the households in the six Old VLS villages (12 Old VLS households plus 36 new households per village), collected during 1989-90.

CHOICE OF STUDY SAMPLE

The size and composition of the sample was selected to (1) maximise the use of the Old VLS time series for an analysis of structural factors affecting current food and

FIGURE 5: OVERLAP OF HOUSEHOLDS WITH A CERTAIN INDICATOR CHARACTERISTICS AND HOUSEHOLDS THAT ARE FOOD INSECURE

nutrition security; and (2) maximise intra-village variability. With regard to the first objective, the three-village Old VLS time series contains a household-level time path of the economic status of 120 households over 10-years. In addition to the Old VLS time series, the Six Village Nutrition Study provides a 15-year-old nutrition baseline for individuals in the 240 Old VLS households. The children in this data set are now adolescents and adults and may have separated into families of their own. Combined with a present-day follow-up of the same households, these data allow us to compare nutritional status and economic well-being during childhood and adulthood.

To maximise the number of cases on which longitudinal contrasts may be performed, it was necessary to (1) re-survey as many of the Old VLS families as possible; and (2) survey the households of individuals who have separated from the original Old VLS household ('spin-off families'). An investigation of the spin-off families required an increased survey burden in each of the Old VLS villages so the number of villages investigated needed to be reduced. Visits to the six villages in March 1992 indicated that a four village study of Kanzara, Shirapur, Aurepalle and Dokur would be both feasible and desirable. Kalman and Kinkheda villages were dropped from the sample since agricultural conditions in Maharashtra were found to be more variable between districts rather

than within districts. Specifically, rainfall patterns (and hence crop performance) were quite similar in Kanzara and Kinkheda; yet they varied considerably from those found in the dry Sholapur district where Kalman and Shirapur were located. In the Mahabubnagar villages, the significant variability in cropping patterns and irrigation practices prompted us to retain both villages (Aurepalle and Dokur) in the sample.

To maximise intra-village variation, the sample was expanded beyond the Old VLS sample and their spinoffs. Specifically, the New VLS households were included and a few 'Non-VLS' families were added to bring the sample up to 80 households in each village. In total, 320 households were surveyed from the four villages.

The criteria for the selection of the sample are as follows. Within each village all Old VLS families with children less than 18 years of age were included in the sample. These households were selected since the children of these families were pre-schoolers at the time of the original nutrition study. In addition, spin-off families (those that separated from the Old VLS households since 1984) were included to enhance the sample size for inter-generational analyses. The new VLS households were included, regardless of family composition, in order to take advantage of the 1989-90 economics survey of these households. Finally, 'Non-VLS' households (less than 11) were randomly chosen from a list of landless and

small farming families which had more than two pre-school children. These families were given priority to ensure that we had a sufficient sample of pre-schoolers,

TIMING OF SURVEY ROUNDS

The semi-arid climate of the VLS villages results in seasonal variations in food production, labour demand, and purchasing power [Behrman 1987]. In the four study villages, the timing of cropping cycles and labour demand differs significantly. We therefore chose to survey during rounds which represent periods of (1) high food production and high labour demand ('peak'); and (2) low food production and low demand ('lean'). In addition, due to the interaction between morbidity and nutritional status, a 'medium production-high morbidity' round was included.

Food security at the village level is expected to be low following harvest periods. During these times, staple crops are abundant and prices are relatively low. During the period preceding the harvest, however, food stocks are low and the price of staple crops rises. For large farmers who have ample stocks, food availability is not a problem at this time. But for small and medium farming households food security can be problematic since food stocks have usually been exhausted. Landless households are expected to be particularly vulnerable since they must purchase grain at market prices if they are not paid in kind. The form of payment is usually dictated by employers and is dependent on the market worth of the crop. If, for example, prices are high, employers tend to pay in cash; if prices are low they tend to pay in kind.

TABEL 4: FREQUENCY DISTRIBUTION OF SERUM VITAMIN A AND HEMOGLOBIN LEVELS FOR PRE-SCHOOLERS IN AUREPALLE AND SHIRAPUR, ROUND 1, 1992

Biochemical Indicator		Aurepalle	Shirapur
(pre-schoolers)			
Serum	< 20 ug/dl	8 (16)	16 (49)
Vitamin A	> 20 ug/dl	41 (84)	17 (51)
Hemoglobin	< 10 g/dl	21 (41)	13 (39)
	> 10 g/dl	30 (59)	20 (61)

Note: Figures in parenthesis are percentages.

TABEL 5: FREQUENCY DISTRIBUTION OF SERUM VITAMIN A AND HEMOGLOBIN LEVELS FOR MOHERS IN AUREPALLE AND SHIRAPUR, ROUND 1, 1992

Biochemical Indicator		Aurepalle	Shirapur
(mothers)			
Serum	< 20 ug/dl	2 (3)	6 (11)
Vitamin A	> 20 ug/dl	60 (97)	49 (89)
Hemoglobin	< 10 g/dl	7 (11)	11 (20)
	> 10 g/dl	56 (89)	44 (80)

Note: Figures in parenthesis are percentages.

Table 1 shows the timing of each round in the four villages as well as the timings of harvests and labour demand. The survey rounds are not necessarily concurrent across villages because peak and lean seasons are not identical in all villages.

BACKGROUND INFORMATION ON STUDY VILLAGES

The study villages are located in three districts in two states. Dokur and Aurepalle are located in Mahabubnagar district in Andhra Pradesh, Shirapur is in Sholapur district, Maharashtra, and Kanzara is in Akola district, Maharashtra (Figure 3). The village economies are based on rain-fed agriculture, but rainfall is low and is particularly erratic in Mahabubnagar and Sholapur districts (Table 2). Indeed, as Walker and Ryan (1990:221) state:

What distinguishes the SAT from more humid environments is the high incidence of rainfall-related production risk. If insurance markets were complete, capital markets allowed households to save and borrow to smooth income variability, and future markets gave information on prices, risk would not be a source of concern in a country as large as India.

In terms of overall welfare, Aurepalle is the worst-off village. In Aurepalle, per capita income is lowest and the percentage of landless individuals who are not meeting 50 per cent of their energy requirements is highest. Aurepalle is characterised in Walker and Ryan as "poorly developed and subsistence-oriented, with a high degree of seasonality and substantial relative and absolute poverty" [Walker and Ryan 1990:297]. However, according to the 1977-78 nutrition study, mean calorie adequacy is under 100 per cent for most of the year in all villages except Kanzara. In the hot dry season in Aurepalle, mean calorie adequacy is a mere 70 per cent [Walker and Ryan 1990:275]. Micro-nutrient adequacy is even less satisfactory. All four villages have mean nutrient adequacy well below 100 per cent for beta-carotene and ascorbic acid. In addition, Aurepalle has low intake levels for thiamine, iron, and niacin while Dokur has low consumption of calcium, thiamine, niacin, iron, and riboflavin.

In Aurepalle, Shirapur and Kanzara, the nutrition data have not been updated since 1978. In Dokur, nutrition data from 1985/86/87 show sustained improvements in energy and nutrient intake, but they are not accompanied by concomitant increases in weight-for-age and weight-for-height. This most likely reflects a lack of improvement in non-food health input levels such as morbidity and time intensity of activities.

Walker and Ryan (1990) state that most of the explained variation in dietary intake

and anthropometry in 1977-78 was due to inter-regional and inter-village differences. They, therefore, maintain that nutrition interventions should be undertaken at the village or regional level. In terms of indicators, the obvious implication is that the collection of poverty and food and nutrition indicators is most efficiently conducted at the village or even regional level, but not at the level of the household or individual. For example, they state that:

The results in this chapter show how hard it is to establish centralised guidelines for targeting beneficiaries for subsidised poverty alleviation programmes, such as the Integrated Rural Development Programme (IRDP), in poor dryland farming communities. In Aurepalle, membership in the hanjan community would be an effective marker of low economic status, in Kanzara, landlessness would likely be as good as any other criterion to identify endemic poverty in the village; and lastly, in Shirapur, one would be hard pressed to suggest an indicator that effectively sheds light on the shades of poverty in the village.

Walker and Ryan further suggest that the case for nutrition targeting of young children is strong, but not for adults. Again, the majority of the variation in adult nutrition status and food intake is due to

inter-village, as opposed to intra-village, variations. Instead, Walker and Ryan are much more enthusiastic about 'self-targeting' public works interventions such as the Maharashtra Employment Guarantee Scheme (MEGS).

There are, however, a number of compelling reasons to continue the search for appropriate household-level indicators in the SAT. First, the VLS nutrition surveys did not specifically measure the nutritional status of pregnant and lactating women, nor those individuals over 60 (due to small sample sizes in the latter case). It is likely, therefore, that heterogeneity in food security within and among households is under-estimated by the 1977-78 data.

Second, nutrient intake varies considerably by per capita expenditure level, further emphasising the heterogeneity in nutrient consumption within villages. This is clearly demonstrated by the response of the micro-nutrient intake of children under the age of 12 to increases in household per capita expenditure. For example, nutrient-per capita elasticities for calcium, beta-carotene and ascorbic acid are 0.56, 0.51 and 0.44 respectively. This result is reinforced by the significant (although quite small in magnitude) positive link between land-holdings and household energy and nutrient consumption.

TABLE 6. EXAMPLES OF FLOW AND STRUCTURAL INDICATORS TO BE TESTED BY TYPE OF DATA COLLECTION METHODOLOGY

Alternative Indicators	Structural or Flow Indicator	Source of Indicator		
		Survey	PRA	Ethnography
Dependency ratio	Structural	XXX		
Number of meals consumed/day	Flow	XXX		
Household identified on village map as 'at risk'	Flow		XXX	
Number of different foods listed on food chart	Flow		XXX	
Disabled person living in house	Structural		XXX	XXX
Purchased new clothes for Diwali	Flow			XXX

TABLE 7. CONSEQUENCES OF INDICATOR ADOPTION UNDER SITUATIONS OF HIGH AND LOW ASSOCIATION BETWEEN THE ALTERNATIVE AND TRADITIONAL INDICATORS

		Unobserved Association between Traditional Indicator and Benchmark	
		High	Low
Observed association between traditional indicator and lower-cost alternative indicator	High	Scenario 1 Adoption of alternative indicator; lower cost, equally accurate	Scenario 3 Adoption of alternative indicator; lower cost, but equally inaccurate
	Low	Scenario 2 Non-adoption of alternative indicator; lower cost, but inaccurate	Scenario 4 Non-adoption of alternative indicator; lower cost, but not enough information to determine whether an improvement over traditional indicator

Third, household-level indicators from the basis of village-level indicators. Fourth, the eligibility of self-targeting programmes such as the MEGS may have to be restricted (perhaps based on a food security indicator) in the face of downwardly flexible nominal wages in the villages [Walker and Ryan 1990:148]. For instance, if there is political pressure to offer a MEGS wage at a level just below the labour market wage, universal eligibility may be financially infeasible [Reddy 1993].

Finally, conditions in the villages and the regions have changed in the 15 years since the last nutrition study. Do the mechanisms which reduced the variability in nutritional status among households still exist?² This question is all the more relevant as these mechanisms – public and private – will probably experience increased stress as India's economic adjustment package is implemented.³

III Field Testing

SURVEY

Both economic and nutrition records are being collected in all villages. Table 3 shows the various modules collected in each village. Since the overall objective of the study is to identify the most simple indicators, it will be noted that several modules offer overlapping information. Dietary adequacy, for example, is assessed by several different methods: 24-hour diet recall, food frequency and food expenditures.⁴ Each of these methods requires different enumerator skills as well as different respondent skills. Each method will also require different amounts of time for collection and analysis. Accordingly, the costs of indicator collection and analysis will vary.

Aside from testing the efficiency of different data collection methods, the survey modules also try to keep the form of the alternative indicators as simple as possible. For example, income level will not be calculated for each household. Rather, the number of income sources and interruptions in household income flows (for instance due to unemployment) will be recorded for each household.

Table 3 also shows the coverage of each module in each village. Individual-level data collection is more detailed in Aurepalle and Shirapur. While we would have preferred to collect detailed data on all persons in the sample, financial constraints precluded such a comprehensive survey. We have, therefore, focused our nutrition and health questions on females and children. The focus on children is not new, but the focus on women who are not mothers is. This focus reflects a growing recognition that women contribute significantly to household food production,

and in many cases are the sole providers of food. In such cases it becomes important to understand that women's health status plays an important economic role within the household and may therefore have an impact on food and nutrition security beyond that associated with reproduction. To avoid making a priori assumptions that men and boys are not included in the vulnerable groups we will also perform gender-related contrasts for all age groups in Shirapur and Aurepalle.

QUALITATIVE DATA

In addition to the survey data, the project team also collected qualitative data in two villages, Shirapur and Aurepalle.⁵ The qualitative data are collected with participatory rural appraisal (PRA) modules, season-specific village-level ethnographic reports, and six case studies of selected families in Aurepalle and Shirapur. This information will (1) provide qualitative support for the information produced by the survey, (2) help develop unique emic indicators of food and nutrition security, and (3) help develop a procedure for determining emic indicators from qualitative information.

Large surveys are often justly criticised for being inappropriately designed and disrespectful of local knowledge. One way of countering this criticism is to improve the design of surveys and treat respondents with the respect they deserve. Another way of countering this criticism is to employ data collection methods that encourage researchers to listen to, and learn from, the respondents [Chambers 1991]. Specifically, PRA data collection embodies the principles of 'optimal ignorance' (not trying to find out more than is needed) and 'appropriate imprecision' (not measuring more accurately than is necessary for practical purposes).

The use of PRA techniques offers the possibility of obtaining a holistic picture of

household/family/community food security interactions while reducing the costs of data collection. The application of the approach to nutrition and health is relatively recent [Bentley 1988] and has been mostly limited to project development and evaluation. Recent research experience focusing on the complementary nature of qualitative and quantitative methods for evaluating health and nutrition status has, however, proved to be quite successful [Paolisso and Regmi 1992].

To explore the use of PRA as a research tool for generating indicators, four different PRA exercises are being conducted concurrently with the survey work. To prepare for this venture, a joint team from two Bangalore-based NGOs, MYRADA and Outreach, conducted a week-long training workshop to teach the investigators various PRA methods. The four exercises chosen for the study are village mapping, food charts, women's activity charts, and seasonality charts. Two investigators on the Aurepalle and Shirapur research teams have special responsibility for conducting exercises. Village mapping is used to identify households that are at 'very high risk' and 'no risk' of food and nutrition insecurity as defined by the villagers. Essentially, the method involves asking a group of villagers to draw a map of their village. Typically, the map is drawn on the ground using

TABLE 10: MISCLASSIFICATION OF THE FOOD INSECURE WITH THE ALTERNATIVE INDICATOR

Food insecure as defined by alternative indicator	Food Insecure as Defined by Traditional Indicator	
	Yes	No
Yes	a	b
No	c	d

Note: a = Number of households or pre-schoolers classified as food insecure by both the traditional and alternative indicators.

TABLE 8: ALTERNATIVE INDICATOR SHOWING PERFECT ASSOCIATION WITH TRADITIONAL INDICATOR OF FOOD SECURITY

Alternative Indicator of Food Security Tercile	Traditional Indicator of Food Security Tercile		
	Low Food Security	Medium Food Security	High Food Security
Low food security	100	0	0
Medium food security	0	100	0
High food security	0	0	100

TABLE 9: ALTERNATIVE INDICATOR THAT SHOWS NO ASSOCIATION WITH TRADITIONAL INDICATOR OF FOOD SECURITY

Alternative Indicator of Food Security Tercile	Traditional Indicator of Food Security Tercile		
	Low Food Security	Medium Food Security	High Food Security
Low food security	33.3	33.3	33.4
Medium food security	33.3	33.3	33.4
High food security	33.3	33.3	33.4

'rangoli' (coloured powder) provided by the investigators. a larger group of villagers is then consulted in order to identify households which are 'very high risk'. This identification exercise is conducted separately for men and women in order to measure gender-differentiated perceptions of risk.

The construction of food charts is done at the household level. The key informant is each household should be the person in charge of or 'controlling' the food supply. The informant is asked to picture the foods currently consumed by the household. No attempt is made to standardise the number of foods reported by the informant; the fact that an informant wishes to list three types of sorghum as opposed to one may be a valuable indication of diet diversity. The informant is then asked to place ten beans in a column above the food item most consumed, and one bean on top of the food item least consumed. Consumption of other foods is ranked in relation to the number of beans in these two columns. Women's activity charts are structured in an identical fashion, but the respondent is asked to list activities undertaken instead of foods consumed.

The fourth PRA method used is the seasonality chart. This method is conducted with small groups (differentiated by gender and caste) to understand the yearly changes in rainfall, harvests of two main staples, food consumption, male and female labour demand, childhood illness, and women's illness. In a scheduled caste area, separate groups of men and women are asked to 'make a picture' of how the above aspects of village life have varied throughout the past 12 months. The group is asked to place 10 beans of one colour in a column above the month in which a particular characteristic (e.g. rainfall) is most extreme. The group is then asked to place one bean on top of the month in which the characteristic is least evident. This exercise is then repeated with a group of higher caste villagers to capture intra-village heterogeneity in perceptions.

Once completed, indicators from each of the exercises may be constructed. For example, the number of items listed by the food preparer on the food chart can be constructed and compared with the survey variables. From the village map, we can construct an emic indicator of whether or not a household is identified as 'at risk' by the villagers. These indicators may be compared with the traditional, etic indicators derived from the survey.

ETHNOGRAPHY

In a further attempt to learn how villagers interpret the terms 'hunger' and 'food insecurity', an ethnographer has been placed in Shirapur and Aurepalle for the duration

of each survey round. The ethnographer uses in-depth interviews, key informant interviews, focus groups, and participant observation to conduct six household case-studies as well as village-level profiles each round. The case study work will be used to develop unique, emic indicators of food and nutrition security. These indicators will be compared with the etic indicators produced by the survey.

Although the case study method is meant to be fluid and unstructured, general guidelines for the ethnographers have been developed. The guidelines include the following topics:

(1) What are local perceptions of 'health' and 'food security'? What community, household, and individual resources are required to obtain health and food security? Does this vary by sex and age?

(2) Within this community, what are traditional early signs of 'food insecurity'? How are 'high risk' households or individuals identified by local people?

(3) What is a 'good quality' diet? In times of plenty or scarcity, how does this diet change and what are the consequences of change?

(4) What has been the experience of local people regarding fluctuations in food or nutrition insecurity? What factors are perceived to be responsible for these fluctuations? How do rural households cope with threats to food or nutrition security? What do people do to protect food/nutrition security?

(5) What is the decision-making process within the household with regard to achieving

food/nutrition security or responding to problems in its attainment? Who makes specific decisions, how are resources allocated/reallocated? What is the bargaining power of different family members?

Once collected, the qualitative data will be entered into word processor files and analysed using a software text retrieval programme, Zy-Index. Data entry and analysis will proceed concurrently with data collection, to allow for the identification of promising unique indicators that can be further investigated. In addition, indicators that are identified in the first and second rounds as potentially useful can be incorporated into the survey in round 3.

SERUM ANALYSES

In order to provide objective benchmarks of micro-nutrient adequacy, serum measurements of vitamin A and iron status are being collected for pre-schoolers and their mothers. The collection and analysis of these biochemical indicators is made possible through collaboration with the National Institute of Nutrition (NIN) in Hyderabad. Thus far, the data collection has been quite successful given the usual difficulties of gaining compliance in blood studies. In Shirapur, 82 per cent of the possible sample (n = 109) were covered, and in Aurepalle approximately 85 per cent of the possible sample (n = 132) were covered. This high level of coverage was achieved for a number of reasons: (i) ICRISAT's excellent rapport with the villagers; (ii) the presence of a physician

TABLE 11: DEFINITIONS OF MISCLASSIFICATION INDICES AS APPLIED TO IDENTIFICATION OF ALTERNATIVE INDICATORS

Misclassification Index	Formula	Comments
Sensitivity	$a/(a+c)$	Proportion of food insecure (traditional indicator) identified as food insecure by alternative indicator.
Error of exclusion	$c/(a+c)$	Proportion of food insecure (traditional indicator) not identified as food insecure by alternative indicator.
Specificity	$d/(b+d)$	Proportion of food secure (traditional indicator) identified as food secure by alternative indicator.
Error of inclusion	$b/(b+d)$	Proportion of food secure (traditional indicator) not identified as food secure by alternative indicator.
Positive predictive value	$a/(a+b)$	Proportion of food secure by alternative indicator who are food secure (traditional indicator).
Negative predictive value	$d/(c+d)$	Proportion of food insecure by alternative indicator who are food insecure (traditional indicator)

¼ 9	80.2	5.4	65.6	10.8

for free consultations with respondents; and (iii) the professional conduct of the NIN personnel.

Hemoglobin samples were analysed using the filter paper technique developed by NIN [NIN Annual Report 1986]. Vitamin A samples were analysed using a variation on the micro-fluorometric technique reported in Siva Kumar (1977). Preliminary results from the first round indicate that 49 per cent of the pre-schoolers sampled in Shirapur have marginally low levels of serum vitamin A (< 20 g/dl), and 39 per cent have deficient levels of iron (< 10 g/dl Hb) (Table 4).⁶ In Aurepalle, iron status is poor among 41 per cent of the sampled pre-schoolers, although vitamin A deficiencies are not alarmingly high (16 per cent). Among the mothers sampled, serum hemoglobin levels are low in Shirapur, but not overwhelmingly so in Aurepalle (Table 5)

IV Analysis Plan

A useful indicator can locate the food insecure while being reasonably inexpensive to collect. Past efforts to evaluate indicators have tended to focus on locating the food insecure rather than estimating their associated costs [Glewwe and van der Gaag 1990; Glewwe and Kanaan 1990; Haddad and Kanbur 1991]. The Alternative Indicators Project is making a serious attempt to look at both sides of the coin: the ability to locate the food insecure, and the relative costs of collection.

ABILITY TO LOCATE THE FOOD INSECURE

Flow and Structural Indicators

The indicators that are generated from the household survey, the PRA exercise, and the ethnographic case studies can be classified into two broad categories: indicators that change values frequently (such as the number of unique foods consumed) and those that do not (such as landholdings or quality of dwelling). The former class of indicators, the 'flow indicators', may be useful measures of short-term fluctuations in food security. If, for example, a flow indicator moves downwards and settles at a lower bound, it may serve to herald changes in the latter category of 'stock' or 'structural' indicators. Negative changes in the structural indicators are likely to indicate risk of acute undernutrition.

The flow and stock indicators can be picked up by all three data collection methodologies (Table 6). From the survey, one cross-section allows us to examine differences across households in terms of flow and stock variables and make inferences about single households over time. With three cross-sections over a 9-month period we can

examine changes in flow indicators and possibly some changes in structural indicators for households over time. Using the VLS time series we can compare current food security with fluctuations in structural variables over the past 15 years. We can also compare the infant-to-adolescent changes in food security of individuals with fluctuations in structural variables over the past 15 years.

Traditional Indicators

A significant limitation of any study that seeks to identify and evaluate alternative indicators of food security is that the analysis relies upon comparisons of the alternative indicator with the traditional indicator. A close association between the traditional indicator and the alternative is therefore useful only when the traditional indicator is accurate at measuring food security. Ideally we should compare the alternative indicator with a 'true' measure of food insecurity, but there is no single, accurate benchmark for this. Figure 4 illustrates the problem.

The implications of this problem for indicator adoption are shown in Table 7. Under scenarios 1 and 2 the traditional indicators accurately reflects the benchmark, and it is useful to compare the alternative to the traditional indicator. Under scenarios 3 and 4, the usefulness of the identification exercise is diminished since the traditional indicator does not reflect the 'true' food security situation.

The traditional indicator of food energy deficit is calorie intake divided by calorie requirement. In order to increase the

correlation between this indicator and the true but unobserved food security situation, we (i) undertake two repeated 24-hour recall surveys *within each round*; (ii) collect three rounds of 24-hour recall data; (iii) construct calorie requirements based on age, weight, sex, physiological status, and a three-scale classification of activity patterns; and (iv) construct a variable which broadens the concept of food security beyond that of calorie adequacies. Specifically, we will construct a variable which incorporates the concept of dietary quality using our measure of micro-nutrient adequacy. For example, we propose a benchmark for household food security in which households that meet 80 per cent of the calorie RDA in addition to 80 per cent of vitamin A and iron are classified as food insecure.

Traditional indicators of vitamin A and iron security also tend to be based on dietary intake. However, unlike energy measures of food insecurity, blood serum analyses of vitamin A and hemoglobin serve as benchmarks against which we can validate the traditional indicator.

Measures of Association

There are a number of methods to evaluate the association between traditional and alternative indicators: two-way tables (what are the main characteristics of food insecure versus food secure households?), correlation coefficients (both continuous and rank), factor analysis, cluster analysis and regression analysis. However, all of these methods have limitations for our purposes. Our preferred techniques are overlap analyses (what per cent of households or

pre-schoolers in an indicator group are food or nutrition insecure?) and the closely related classification analyses.

The flaws in the discarded techniques are not always obvious. For example, in the case of two-way tables, the investigation of the characteristics of households classified as food insecure is suggestive, but it begins with the premise that these households have been located. For instance, the knowledge that 40 per cent, 30 per cent and 20 per cent of households in the lower, middle and upper calorie adequacy terciles, respectively, have unimproved drinking water suggests that this is a useful indicator, but we have to make the further calculation that 44.4 per cent of households with unimproved drinking water are in the bottom tercile of calorie adequacy. In other words, it is difficult to rank indicators from these tables.

Correlation coefficients between continuous indicators are subject to extreme values. This can be corrected to some extent by looking at correlation of ranks. Nevertheless, high correlation coefficients could arise due to close association between indicators at the upper end of the calorie adequacy distribution, and we are more interested in the lower end of the distribution.

Factor and cluster analysis techniques do not work well with categorical values, or continuous variables that are not normally distributed. For variables such as household size, income, food expenditure, and calorie adequacy, factor and cluster analyses are useful identifying patterns among indicators. Factor analysis is concerned with identifying indicators with common variances. In this way we could search for variables which load heavily onto the same factor as the traditional indicators. Cluster analysis is concerned with grouping households on the basis of similarities across a set of measured variables. In this way we could select the most food insecure cluster and examine its profile in terms of the alternative indicators.

Overlap analysis is used by Glewwe and van der Gaag (1990) to measure the association among various poverty measures. Essentially, the technique asks, what per cent of households or individuals possessing a certain indicator characteristic are also food insecure households or individuals? In Figure 5 this percentage is represented by area B over area B+C. Area A represents the magnitude of exclusion error, or the food insecure set that is not identified as such by the indicator. Area C represents the magnitude of inclusion error, or the food secure set that is incorrectly identified by the indicator. Area B represents the correctly identified food insecure set.

In this study we can identify areas A, B and C. Indicators can be ranked on the basis

of $B/(A+B)$ or $B/(B+C)$. The chosen method of ranking will ultimately depend on whether the policy-maker is more intent on minimising errors of exclusion or errors of inclusion. Initially, we choose to rank indicators on the basis of the ratio $B/(B+C)$, because in a true monitoring situation we lack information on the size of $(A+B)$. That is, in a true monitoring system one can observe the set of households with a certain indicator value, but one cannot observe the set of truly food insecure households. For example, we are more interested in the percentage of households with no access to land that are food insecure ($B/(B+C)$) than the percentage of the food insecure that have no access to land ($B/(A+B)$).

As an example of overlap analysis, consider a continuous alternative indicator (per capita land ownership) that splits households into three groups of equal size. The traditional indicator, household calorie adequacy, also splits households into three groups of equal size with the households in the lowest calorie adequacy tercile being defined as food insecure. Table 8 presents an alternative indicator that is a perfect predictor of the traditional indicator. In this case 100 per cent of all households that are classified as food insecure according to the alternative indicator (lowest tercile) are also classified as food insecure with the traditional indicator (lowest tercile). By contrast, Table 9 presents an alternative indicator that shows no association with the traditional indicator. With this indicator, only 33 per cent of the individuals classified as food insecure using the alternative indicator are also insecure using the traditional indicator (see top left hand cell). The magnitude of this 'lower tail' overlap indicates the indicator's ability to locate households at either end of the food security scale. For example, if 60 per cent of all households in the bottom tercile of per capita land ownership are also in the bottom calorie adequacy tercile, then this is a good indicator of food insecurity. If only 10 per cent of all households in the bottom tercile of household size are in the bottom calorie adequacy tercile then household size is a good indicator of food security.

An example of the misclassification method is shown in Table 10 and defined by Tucker et al (1989) in Table 11. These measures are useful when dealing with two by two matrices such as in Table 10, but lose some interpretation when there are more than two alternative and traditional indicator values. An example of the use of classification indices is given in Table 12. Household size is used as the alternative indicator of food security and household calorie adequacy is used as the traditional indicator. Table 12 shows what happens when a programme uses household size as an indicator to determine eligibility. In the

example, eligibility is initially based on small household size. When the eligibility cutoff is raised, more and more households are correctly classified as undernourished according to the traditional indicator, household calorie adequacy (illustrating high sensitivity), but fewer and fewer households are correctly classified as not undernourished (indicating low specificity).

The overlap analysis is not without problems either. For instance, an indicator group can have a high percentage of the total households which are food insecure yet cover only a small percentage of at risk households. Similarly, some indicators will be so general that they will contain all the food insecure households, but the food insecure households will only represent a small percentage of the households with that indicator value.

Ultimately, the only way to rank indicators is to specify what they will be used for. For example, if the policy objective is to minimise undernutrition with a fixed transfer of money or food, indicators can be used to target that transfer. If an indicator-targeted transfer reduces undernutrition by more than an untargeted transfer, the value of that indicator is the amount of food or money an untargeted transfer would have to deliver in order to achieve the same reduction in undernutrition.

COSTS OF LOCATING FOOD AND NUTRITION INSECURE

The cost of collecting and analysing different indicators involves collecting detailed information on time spent in each activity, as well as the cost of supplies required for each method of data collection and data analysis. Table 13 shows the types of information that must be collected for each survey module, each PRA exercise and the ethnography case studies. To compile this information, survey forms included an area to record the time started and ended on each module. For the ethnography investigators were trained to record how much time was spent conducting interviews and writing up interviews. Similarly, for the PRA exercises, investigators recorded the time needed to complete each exercise. Finally, records of all purchases were kept in spreadsheet files.

V Summary

This paper reports on the design of a multi-disciplinary, collaborative project intended to make food and nutrition security systems more viable. The objective of the project is to identify 'alternative' indicators that can be used in food and nutrition monitoring and evaluation systems.

The project is situated in four villages formerly studied by ICRISAT in Maharashtra and Andhra Pradesh. For this study, alternative indicators of household, individual, and village food security are collected using survey, ethnographic and participatory methods three times over a period of a year. These alternative indicators will be compared to traditional indicators, such as individual and household calorie adequacy, that are assumed to represent the true food security situation.

The performance of the alternative indicators will be judged by their ability to track movements in the traditional indicators. Two types of analysis will be used – overlap analysis and classification analyses. Overlap analysis is used to measure the association between various poverty issues by illustrating what percentage of households or individuals possessing a certain indicator characteristic are also food insecure.

The performance of the alternative indicators will also be judged by their cost effectiveness. Specifically, the cost of collecting and analysing different indicators will be calculated by collecting detailed information on time spent in each activity, as well as the cost of supplies required for each method of data collection and data analysis.

Notes

- 1 *Down to Earth*, January 1993, p 15.
- 2 Risk-management and income-smoothing mechanisms described by Walker and Ryan (1990) include: informal credit markets, participation in a tightening agricultural labour market, government land redistributing programmes, and public works programmes.
- 3 In fact, visits to Sholapur district in March 1992 suggest that the MEGS is no longer a significant source of steady income.
- 4 Examples of recent comparative work in this area from India includes Thimmayamma (1987) and Thimmayamma et al (1988).
- 5 Only two villages were selected for additional data collection since project resources were limited.
- 6 We have considered 'marginally low' serum vitamin A values to be < 20 ug/dl. To assess iron deficiency, we have used a hemoglobin cutoff of 10 g/dl. For a full discussion on the appropriate cutoff levels for both indicators, see Gibson (1990).

Poverty and Inequality: Case of Assam

Chandan Kumar Sharma

THE significance of the essay by Mridul Sagar and Indranil Pan (*EPW*, March 5, 1994) on inequality and poverty estimates among the SCs and the STs in the eastern India can hardly be underestimated in providing new insights into the formulation of developmental policies for India as a whole and this region in particular.

Their paper has employed inequality and poverty measures to consumption expenditure data provided by the 38th round of National Sample Survey for SCs, STs, and other households in the four eastern states, Assam, Bihar, Orissa and West Bengal. Consumption expenditure pattern has been analysed to examine inequality and poverty differences among SCs, STs and other households, rural-urban disparities, and inter-state variations. Their study has unearthed several interesting facts which in their words, "have important policy implications".

Nevertheless, in this rejoinder to their essay, I wish to review some of the comments made by the authors with regard to Assam which has been described by them as appearing "to be an outlier among the eastern states (which are) suffering from low consumption standards and high poverty and inequalities". They have found that in Assam consumption levels are high, poverty incidences appear lower than the all-India trends, consumption expenditures are well distributed across the SCs, STs and other households, as also within these households, near absence of inter-class disparities in rural Assam, and finally, owing to the above reasons a difficulty in explaining the social unrest in the state merely in economic terms.

But facts present a radically different picture. Even a cursory observation of Assam's economic scenario makes it crystal clear as to the acuteness of the socio-economic problems the state is confronting *vis-a-vis* other Indian states. As against the contention of the authors, it will be my effort to show, firstly, that socio-economic problems in the state are symbiotically related to its economic backwardness. Secondly, high consumption level does not necessarily imply a low incidence of poverty, and a uniform consumption level among the cross-section of the population does not essentially connote general affluence. Thirdly, a seemingly egalitarian distribution of goods and services cannot be a determinant of economic affluence if the quantum of production in a society is not taken into account. And lastly, high consumption expenditure may also result from many other factors including a higher price of goods and services. The difference between people's capacity and compulsion to pay must be taken into account while inferring conclusions from their consumption expenditure. I will make these points clear by enumerating and discussing some selected cases in this regard.

To begin with, Assam's per capita net domestic product at current prices has always been lower than other states. Not only that, its rate of growth has also been lower. In 1991-92, the figures for above indicator for Assam (Rs 4,230) compares disfavouredly with most of the states (*Economic Survey*, 1993-94). For the richest state, Punjab, this figure stands at Rs 9,643 which is double that of Assam. Again, according to the provisional data for 1993, the total number of bank offices in Assam was 814 in September 1993 which ranks very low among the states of India (*Economic Survey* 1993-94). The number of banks per lakh of population on October 1, 1989 was 4.5 in Assam (only above Manipur) while the national figure was 7.1. Besides, the per capita advance of bank credit for the same period, Rs 415, was a sharp contrast to the national figure of Rs 1,218. In this regard only Arunachal Pradesh, Bihar, Manipur, Mizoram and Nagaland are below Assam. Similarly, per capita bank deposit on October 1, 1989 was Rs 730 in Assam (only ahead of Nagaland and Orissa) while the national average was Rs 1,920 (*Statistical Handbook, Assam* 1991). These data clearly exhibit the fact that Assam is largely a subsistence economy with a meagre capital formation. If the people's ability to save is any indication of their economic capacity then the case of Assam largely denies the contention of the authors regarding it. It is quite surprising as to why they ignored the crucial factor of the people's saving capacity in order to estimate their economic status of Assam *vis-a-vis* other states.

An analysis of the agricultural scenario of Assam, a predominantly agrarian economy, will further refute the conclusions of the authors. From 1985-86 to 1987-88, the per capita foodgrain production in Assam was only 6.4 kilogrammes (ahead of Arunachal Pradesh, Mizoram and Nagaland) in sharp contrast to the national average of 51.2 kilos. Again, the percentage of gross irrigated area to gross cropped area in Assam in 1986-87 was only 15 while the national figure was 30.4 (*Statistical Handbook, Assam*, 1991). Consumption of fertiliser is also substantially low in Assam. These figures are demonstrative of the fact that Assam's economic backbone, agriculture, is quite fragile and is characterised by an acute absence of commercialisation. Not only that, it is also vulnerable to natural hazards like floods, which take away any entrepreneurial zeal on the part of the peasants. Therefore, it is not surprising that the quantum of production is used up mainly for consumption purposes as there is hardly any scope of marketing them.

The per capita gross output of the industrial sector in 1985 was Rs 807 in Assam (above

Jammu and Kashmir, Manipur and Meghalaya) as against the national average of Rs 1,592. In 1987-88, the per capita industrial consumption of electricity in the state was 31.2 KWh (above Arunachal Pradesh, Manipur, Mizoram, Sikkim and Tripura) while the national figure was 90.9 KWh. This should suffice to explain the deplorable condition of industrial growth in Assam. The precarious power situation in the state can be gauged from the fact that in 1987-88 the per capita domestic consumption of electricity in Assam was 6.4 KWh ahead only of Bihar, as against the national figure of 27.4 KWh (*Statistical Handbook, Assam*, 1991).

A well-developed network of transport and communication is a fundamental precondition for the development of any particular region. Apart from the road transportation (which is perpetually in a lacklustre condition, more so due to the heavy rainfall and subsequent floods), there is only one railway track connecting the upper and the lower Assam. Broad gauge line is only up to Guwahati (very recently it has been extended up to Lunding in central Assam). Most parts of the state are still not connected by railways. The British colonial administration constructed railways for the purpose of draining out resources like tea, crude oil, coal, plywood, etc. Thus, barring areas yielding these items other important areas were deprived of the railway network. By and large, this situation still prevails. It creates acute problems during rainy season when roads are inundated by flood water and many areas become unreachable, accompanied by a whopping rise in prices of essential goods and services. Some years back there was only one bridge over the Brahmaputra connecting its north and south banks despite the fact that this mighty and turbulent river flows throughout Assam. In the last decade, two more bridges have been built. But this still is inadequate. The situation hardly needs any further elaboration so as to comprehend the extent of wastage of time, money and resources, apart from human misery. The prevailing scenario of transport and communication in Assam is indicative of an underdeveloped, sterile economy.

As has already been mentioned, massive periodic floods (on average five to six a year) caused by the mighty Brahmaputra and its tributaries have become a perpetual phenomenon in Assam, resulting in immense loss of human lives and property every year. Each year new areas get affected by floods. Erosion in different places is occurring at an alarming rate. But there is no perceptible effort on the part of the government to contain the deteriorating situation. This is despite the fact that rivers in Assam have tremendous potential to generate hydro-electricity and provide irrigation facilities if they are utilised properly.

Assam is one of the largest producers of tea in the world. Its export makes a hefty

contribution to the national exchequer. But this industry has not made any significant contribution towards the development of the state. The character of the tea plantation industry still largely conforms to the British colonial mode of exploitation resulting in massive outflow of surplus from the state. There is still no qualitative change in the working and living conditions of its several million-strong ethnic workforce known as the 'chah banuas'. They are one of the most backward communities in the state in terms of education, health and economic status.

The same is true with the oil and natural gas sector of the state. Till today, no noteworthy auxiliary industry has emerged based on these resources. On the contrary, on account of drilling oil in different places of upper Assam, a massive requisition of agricultural land is underway without meting out adequate compensation to the poor tillers. Not only that, the burning of natural gases in the fields (which is in itself an unforgivable wastage) by generating excessive heat has rendered the adjacent agricultural lands redundant which in turn has accentuated the ongoing process of landlessness and poverty.

Besides, Assam constituted till some years back the highest forest reserve in the country. But the situation has radically altered since then. Assam's forestry is dwindling very rapidly as a consequence of arbitrary cutting of trees for timber mills and other construction purposes and usurpation of forest lands by immigrants which has affected Assam not only economically, but ecologically and socially also.

It is true that the enterprises based on tea, oil, and forestry are hugely surplus-yielding sectors. But these sectors have contributed very little for the development of a strong indigenous, self-reliant Assamese economy. This is so because the interests and the objectives of these sectors are not articulated with the economy of the state. They have paved way for penetration of monopoly capital into the state and thereby effecting a huge surplus outflow from the state. Incidentally, these sectors are often targets of the extremist armed forces operating in the region. Here we behold a clear connection between the economic exploitation and the socio-political turmoil in the region, which the authors for some unknown reasons failed to see.

Lastly, the phenomenal growth of population in Assam is a widely-acknowledged fact. During 1961-71, the population of Assam grew by 34.95 per cent compared to the national average of 24.8 per cent [1]. For the period 1971-91 (in Assam, there was no census in 1981), this growth was 52.44 per cent again exhibiting a much higher growth than the national average (*Statistical Handbook, Assam, 1991*). Illegal migration from Bangladesh is a main cause behind this phenomenon. In the wake of the sustained influx of outsiders, the percentage of Assamese speaking population in the Brahmaputra valley had shrunk from 73.2 per cent in 1961 to 60.9 per cent in 1971 [1]. Since then, the figure has further decreased

alarmingly. The abnormal growth of population has resulted in considerable shrinkage of employment opportunities (the percentage of working population in Assam was 28 per cent in 1981 in contrast to the national average of 33.4 per cent, of agricultural land and forestry, and other crises in many spheres leading to the frustration of the natives of Assam. This feeling is all the more acute due to the lack of any perceptible economic development in the state despite its bountiful natural resources. These economic grievances are not without their political reverberations. The emergence of regionalism, secessionism, and ethnic conflicts must be analysed from this angle to get a correct perspective of the situation.

However, the authors have correctly noted that in Assam the consumption expenditure is well-distributed among the SCs, STs and other households. They have further discovered that rural Assam is marked by an absence of inter-class disparities. However, both of these contentions have to be evaluated under the purview of the peculiar historical reality of the state.

It barely needs any reiteration that the contemporary socio-economic disparities among the SCs, STs, OBCs and other upper-castes in India is an offshoot of the caste system. A rigid caste system provided an ideological tool to the upper caste dominated feudal social structure which in turn augmented the disparities between the higher and the lower castes. Contrary to this, penetration of sanskritic caste system was never complete in the semi-tribal, semi-feudal social structure of Assam (with an overwhelming tribal population and a minority of higher caste, and the rulers of the kingdoms invariably hailing from the tribal communities), since it did not create a situation where feudal superstructural phenomenon like caste system could thrive. Further, the egalitarian neo-vaishnavite movement in the medieval Assam thwarted the consolidation of caste system. Many upper-caste members also got proselytised to the neo-vaishnava sect. Moreover, the life style of the upper castes was influenced by many tenets of the egalitarian tribal culture of the region. As a consequence, caste disparities in Assam are not as intense as in north India.

There never existed in the history of Assam a significant class of agricultural labourers. During the Ahom reign average Assamese peasant had 2.66 acres of usufruct land which they enjoyed in return for their services towards the state. The introduction of fryotwari system of land revenue instead of zamindari system by the British in the mid-19th century Assam posed a significant inhibition on the emergence of a class of landed gentry and thereby obstructed the growth of a sharply differentiated rural society in the region. Roughly, both these phenomena are responsible for the low class (and caste) disparities in rural Assam. However, this low level of inter-class disparities in rural Assam do not in anyway suggest general economic well-being.

The above discussion conspicuously shows that Assam is not an outlier among the poverty-ridden eastern states of India as per the contention of the authors. Rather, in most of the cases its condition is far worse. This holds valid also in case of other north-eastern states, which is vividly demonstrated by the data presented above. The paradoxical findings of the authors in this regard largely stem from the fact that they have inferred too much from the consumption level and the consumption expenditure data in order to estimate poverty and inequality but, on the other hand, have ignored other vital indices like the total quantum of production. If the latter is taken into account, it will be found that the egalitarian consumption level of the people does not necessarily show general economic affluence, rather it is demonstrative of conspicuous poverty in a highly consumption-oriented agrarian economy.

Secondly, Assam is quite backward in both, agriculture and industry. Agriculture is marked by the lack of commercialisation and its susceptibility to natural vagaries. The excessive pressure on agricultural land due to the burgeoning population augmented by the unrestrained immigration has not only given rise to economic problems but also to ethnic and communal problems of alarming proportions insofar as the usurpation of tribal lands is concerned. The industrial sector in Assam has not gained in any significant way from the existing industrial enterprises based on the resources like tea, oil and natural gas, coal, plywood, etc. This is so because the surplus yielded by these sectors is largely drained out of the state to the detriment of building a self-reliant Assamese economy.

Finally, the authors' contention that contemporary socio-economic turmoil in Assam cannot be explained solely by economic factors is erroneous and marked by an air of ambiguity. It is true that the linguistic, ethnic, and sub-nationalist forces are quite vibrant in this region. But to shun aside the economic dimension in the analysis of these problems will result in the lopsided presentation of the objective situation in Assam. In fact, a collation of data may not necessarily provide the desired insight into any specific problem unless they are observed and analysed in the light of their contextual reality. It is this concern that has prompted this response.

[I am grateful to Virginius Xaxa, Reader, department of sociology, Delhi School of Economics, Hemanta Laskar, department of economics, Ramjas college, University of Delhi and Sanjay Singh for their critical comments on the first draft of this paper. Any remaining errors are, however, the responsibility of the author.]

TAXSAVER - 95

Highlights

- High growth equity scheme with specific focus on primary market and tax concession under Section 88 of Income Tax Act.
- Ten year close ended scheme with unlimited repurchase facility after 3 years.
- Repurchase at full Net Asset Value without any discounts.
- Liquidity after 3 years-listing at Bombay, Delhi and Calcutta Stock Exchanges
- Periodic dividend distribution.
- Payment can be made through Cancard / Citicard.
- Full and firm allotment

Risk Factors

- All securities investments carry market risks.
- Mutual Funds and securities investments are subject to market risks and the net asset value of the scheme may fluctuate depending on factors affecting capital markets.
- There can be no assurance that the objective of the scheme can be achieved.
- GIC TAXSAVER - 95 is only the name of the scheme and does not in any manner indicate either the quality of the scheme, its future prospects or the returns.
- Past performance of GIC Mutual Fund does not guarantee future performance of schemes of GIC Mutual Fund.
- Investors are requested to study the terms of offer document carefully before they invest in the Fund.

Vol XXX No 9

March 4, 1995

Literature and Society

It is a pity that social scientists have made so little use of literary sources, particularly in studies of rural societies, because novels, stories and poems can provide much information that is otherwise hidden from even the most discerning social scientist. Thus Bengali fiction reveals a complex pattern of dispossession, degradation and empowerment of the peasantry and the poor in contrast to their representation as passive recipients of elite ideology in the mainstream paradigm of peasant studies. 441

Tax Management

Proper management determines the effectiveness of a tax system. In view of the proposed move to introduce a scheme of value added tax to replace sales tax in the states, consideration of measures to improve sales tax management has become particularly relevant. 449

Secularism Reconsidered

A small but growing number of social scientists are calling for a re-examination of Indian secularism, arguing that secularism may indeed be the cause of, rather than the solution to, India's crisis. The arguments of these writers need to be examined and their implications for the maintenance and defence of India's pluralist and multi-religious society, culture and polity need to be assessed. 457

Restructuring Banks

Restructuring of banks capital has to be done after careful consideration of all the implications, and not as part of hasty half-baked schemes of partial privatisation. An outline of an integrated scheme for capital restructuring of banks. 421

Changing Sociology

Sociology in France is undergoing great changes, with the rejection of older paradigms throwing up new problems. The changes which are directly related to the changes that are taking place in society, raise the famous question posed by Max Weber about the relation between science and politics. 433

Funding Safety Nets

The outcome of the assembly elections in Andhra Pradesh brought out the popular urge for safety net schemes in the wake of the centre's liberalisation and globalisation policies. However, unless fundamental changes are effected in the states' fiscal administration, the problem of finding resources for the new welfare schemes will remain intractable. 417

Language Tree

Literary Urdu is not adapted, in India, for modern discourse of a technical nature. So one chooses if it is emotional it will be in Urdu; if it is scientific it will be in Hindi, if it absolutely must be in common Hindustani it will be trivial and depthless. But intuition and fearlessness have a way of cutting through these man-made strictures. 423

Productivity and Policy

The question of productivity growth in Indian manufacturing is far from having been settled. There is, first, the conflicting findings on the behaviour of productivity itself there is, then the relationship between productivity growth and the policy regime which is far from clear. 462

Living with Inflation

The government's economic policy is now guided by the notion that there is no way at least for a long time to come to pull the economy out of the mire of stagflation. It has, therefore settled for keeping inflationary pressures within what may be just tolerable limits for the upper and middle classes whatever be the fate of the mass of the people. 424

China's Ways

In the context of capitalist market developments, alternative institutional arrangements are emerging in China for dealing with the problems of maintaining agricultural, particularly foodgrain, production and of ensuring essential investment in agricultural infrastructure. 431

Repression and Reform

The army crackdown on the Zapatista rebellion in the Chiapas and its subsequent withdrawal in the face of popular opposition underscore the instability and weakness of president Zedillo's government in Mexico. 439

Preconceived Notions

AS one intimately associated with the *EPW* for a number of years, I am dismayed by the 'what I don't like to see does not exist' kind of editorial policy of judging Indian economic reforms. It has been drummed by you into the ears of *EPW* readers that the economic reforms would bring disaster to India. This has been a persistent theme in all issues of *EPW* over the last three years. You had predicted that balance of payments would deteriorate, inflation will worsen, GDP growth rate will fall, industrial sector, particularly capital goods industry will be ruined, tax receipts will go down and so on. However, in the edit 'Behind the Glass' (September 10, 1994) you admit that "on the face of it, many aspects of improved economic performance - the large foreign exchange accruals and reductions in current account deficit, the rise in government tax revenues, the improvement of the fiscal balance, the pick up in private sector investment, the acceleration of growth of industrial output and the moderation of inflation - are more or less palpable". After that one would have expected you and your colleagues to turn the light inward. Instead, you still don't want to concede that the reforms have succeeded in many ways, notwithstanding your wish to the contrary. You go off at a tangent and accuse the policy-makers of "sweeping under the carpet the other fundamental socio-economic problems" and in the process tie yourself in knots as I would show below:

(1) In the same editorial, you state that the present growth is 'borrowed growth'. However, without being aware that you contradict yourself, you mention later that the domestic saving rate exceeds domestic investment by hardly 0.2 per cent of GDP. If domestic saving is almost equal to domestic investment, where is the 'borrowed growth'? I can see the reason for your confusion. You are obsessed with the ballooning foreign exchange reserves induced by capital inflows in the form of portfolio investment, bond issues by domestic private sector and direct foreign investment. But these inflows at the moment are parked in the banking system and once private investment picks up there will be a deficit in the balance of payments, which will be financed by these accumulated foreign reserves. Your 'palpable facts' in fact indicate that a rise in investment is taking place as domestic capital goods production is rising and so are the capital goods imports (see the same edit).

Are you right in calling this 'borrowed growth'? A distinction between loans and equity is crucial. Unlike debt, return on equity is uncertain and that form of investment is profitable only if the resources are efficiently utilised. Furthermore, the exchange rate is not guaranteed. If, for instance, capital flows out, the exchange rate will sharply decline

and the foreign investors will take a beating unlike in the case of foreign debt. You seem to be scaring yourself and the readers by pointing out that earnings on the portfolio investment will involve "foreign exchange outgo". Does it really matter, if the funds are used efficiently? You repeat the same tortuous logic and wrong-headed economics in another edit 'Wishful Thinking on Debt' (October 1, 1994).

(2) Your constant refrain is that the domestic saving rate has been steadily declining since 1991 and you attribute it to the rise in production of consumer durables and fiscal incentives for consumption of luxury goods. What do your facts suggest? Saving rate which was around 24.1 per cent in 1991 after declining to 22.1 per cent in 1992 started rising to 24.2 per cent in 1994. If the increased availability of consumer durable goods was the cause of decline in saving rate in 1992, how could it rise in 1993 and 1994 to a higher level, despite the continued rapid increase in production of consumer durables. The real cause of a fall in saving rate immediately after adjustment policy in 1991 was a sharp decline in income which was to be expected when the ingrained distortions in the economy were being removed. Once income starts rising as it is already occurring, saving rate too will increase steadily; the *EPW* may then invent some other reasons to condemn the government policies.

(3) In the October 1 editorial, you have come up with a strange criticism of the reform policies. You concede that the proportion of concessional aid in total has increased. As if you cannot stomach this good development, you indulge in a *non sequitur*. You call it damaging on the ground that concessional aid which has come with attached conditionalities from institutions like the IMF, World Bank,

ADB, etc, has exposed the Indian economy to "not just export-orientation but globalisation". Assuming conditionality to be pernicious, hasn't Indian economic performance improved as you have pointed out? This only shows that conditionality has proved to be a blessing in the particular circumstances of 1991. Then again you seem to be allergic to export-orientation, foreign portfolio investment, foreign direct investment and foreign debt. Pray how will you then raise India's foreign exchange reserves? Ideological blindness cannot go further.

(4) You smell a rat in finance minister's speech in Madrid where he urged the IMF to provide a facility in the event of sudden capital outflows. You, however, have missed the point. Manmohan Singh was referring to IMF because this suggestion was aired a few months ago by the Fund managing director at the Washington meeting of the International Institute of Economics. There were no takers for this idea. Manmohan's reference to it has nothing to do with "his anxieties about the Indian economy" or his thinking that capital inflows in India are not warranted by the economic fundamentals.

I am sorry to have prolonged this letter but have done so because I fear that *EPW* will soon lose its credibility as a serious commentator on economic issues. Not that everything is hunky-dory in the Indian economy. The reform process is faltering; essential infrastructural investment in education, health and power is made a hostage to a wrong kind of fiscal adjustment; the financial system is in a mess and state-level activities are not at all co-ordinated with the policy strategy of the central government. You can take up these issues and offer informed and constructive criticism only if you give up your preconceived notions about the reform process.

Helpless in Face of Inflation

INDIAN society is said to be highly sensitive to inflation. This is primarily because the vast majority of the people have very vulnerable living standards and cannot withstand much erosion of their purchasing power. Also, people here can still express their anguish at periodic intervals through the ballot box. The suffering caused by the current rising inflation rate should be all the more severe for a variety of reasons. First, with its blinkered perspective of reducing the gross fiscal deficit and, in particular, avoiding borrowing from the Reserve Bank of India, the government has diluted many social and infrastructural development programmes which in the past provided some societal support to the poorer segments. The promised inflation control is, however, nowhere in sight. Second, the supply and demand factors, as they have operated in the past one year, do not warrant such sharp increases in prices as have occurred. Government policies have tended to reinforce an environment which has encouraged hoarding and speculation in many commodities. Finally, government has promoted a social environment in which rapidly growing inequalities in the distribution of incomes and assets have tended to encourage conspicuous consumption among the upper sections of society.

The wholesale price index (WPI) as on February 11 shows a rise of 11.5 per cent over the past 12 months against 9.4 per cent in the preceding 12-month period. The rise in the current fiscal year so far has worked out to 9.8 per cent against 9.1 per cent in the comparable period of the previous year. The acceleration of inflation is also marked when measured in terms of the 52-week or financial year average of the WPI. The latest 52-week average shows a rise of 10.6 per cent against 7.9 per cent in the preceding 52 weeks. The average for the current fiscal year so far registers a similar rise of 10.7 per cent against 8 per cent in the previous fiscal year. At this pace, the fiscal year is sure to end with a 12 per cent inflation rate on point-to-point as well as on average basis against 10.8 per cent on point-to-point basis and 8.3 per cent an average basis in 1993-94 and 7 per cent and 10.1 per cent, respectively, in 1992-93.

Since the beginning of the fiscal year 1991-92, which broadly coincides with the period of stabilisation and structural adjustment, there has occurred a WPI rise of 47.9 per cent, that is, an average annual inflation of about 11.8 per cent against a rise of 7 per cent per annum in the decade of the 1980s. The highest rise of 51.2 per cent since March 1991 has occurred in the CPI for agricultural labourers accompanied by 43.8 per cent rise in the CPI for industrial workers (both up to December 1994) and 42 per cent rise in the CPI for urban non-manual employees (up to November 1994). What is

more, these cost of living indices almost certainly underestimate the relevant inflation rates, judging by price increases in the different items of common consumption.

In the past 12-month period alone, the WPI for primary articles has risen by 15.7 per cent and that for food articles by 13.6 per cent. In the past four years or so, since March 1991, the WPI for food articles has experienced a total rise of 52.2 per cent and that for foodgrains by 54.7 per cent. In the same period, while cereal prices have risen by 53 per cent and pulses prices by 63.1 per cent, the WPI for eggs, fish and meat has shot up by 98.2 per cent, that for condiments and spices by 50.1 per cent and 'other food articles' by 65.1 per cent. But for a drastic seasonal fall in the index of vegetables from 396.7 towards early October to 253.1 in early February (that is, by 36 per cent in four months), the increases in the prices of food articles as a whole would have been much larger. Amongst manufactured food products, dairy product prices have risen by 53.7 per cent, sugar, khandsari and gur group prices by 64.6 per cent and tea and coffee by 59.7 per cent.

Besides food articles, prices of some non-food articles have experienced large increases: 98.2 per cent for the fibres group and 49.9 per cent for 'other non-food articles'. Coal prices have risen by 58.1 per cent and electricity tariffs by 65.9 per cent. As a result of the persistent increases in input prices and the recent recovery in demand after three years of recession, prices of manufactures have also begun to recover the lost ground and are making a substantial contribution to the overall inflation rate. In the past one year alone, edible oil prices have jumped by 20.1 per cent after remaining stable for some time. Similarly, prices of tea and coffee have galloped by 47 per cent in the current fiscal year so far. More significantly, in the past 12-month period, cotton textile prices have jumped by 21.4 per cent, drugs and medicines prices by 17.4 per cent, soaps and detergents by 15.2 per cent, cement by 17.5 per cent, non-ferrous metals by 19.5 per cent, ferro alloys by 39.2 per cent and electrical machinery by 19.1 per cent.

The experience of inflation in the post-economic reform period brings out its strong structuralist characteristics. With a fairly high level of agricultural output for the seventh year in succession, overall foodgrain supplies have been reasonably good. This year's bumper crop has, however, not had any impact on prices. Even the procurement and issue prices for foodgrains, which had played a role in inflation in the earlier years, have been raised by not more than 3 per cent or so in the 1994 kharif season and yet foodgrain prices have experienced an uptrend. Though there have been a few sectoral shortages, as in pulses and raw cotton, the role of

speculation and hoarding in respect of many commodities stands out. In prices of manufactures, the cost-plus pricing system has already begun to absorb the cost-push inflationary pressures. The external sector's influences on domestic prices in terms of depreciation of the rupee, higher import content of output and larger export demand are reflected in many sectoral prices such as tea and coffee and electrical machinery. Even the existence of large foreign exchange reserves has not helped matters, though the government has been repeatedly claiming that relaxation on imports would ensure near normal availability of essential commodities. For instance, despite the dire need for augmenting supplies of pulses, neither private trade nor any government agency has made any systematic procurement and marketing arrangements in the past few years when pulses import has been put under open general licence (OGL); they seem to have a vested interest in keeping domestic pulses prices high.

With the objective of containing the inflation rate within 6 to 7 per cent in 1994-95, the Reserve Bank has undertaken a series of monetary measures in the past six months or so. Apart from restraining the inflow of GDR funds from abroad, the cash reserve ratio (CRR) has been raised or freshly introduced in respect of certain types of foreign currency deposits. Creation of primary money has been sought to be curbed through open market operations and through the imposition of limits on the use of *ad hoc* treasury bills and recourse to RBI credit by the central government. As a result of these measures, the growth of primary money and its sources have been curbed in the recent period. During the past four months, since the end of October 1994, foreign exchange assets have remained below the level of \$ 20 billion then attained. For almost the first time in 40 years, that is, after the Second Five-Year Plan began, expansion in net RBI credit to the central government is *negative* at (-) Rs 1,151 crore in the current fiscal year so far. Consequently, reserve money expansion between the end of March 1994 and February 3 this year works out to only 14.5 per cent as against 18.3 per cent in the corresponding period of the previous year. Even overall M3 growth has been moderated in recent months to an extent. No doubt, a major expansionary factor in the current monetary and banking scene is the rapid expansion in non-food advances to commercial sectors. These credit increases reflect the increased tempo of industrial activity and have occurred after three years of unusual sluggishness in expansion of both bank credit and industrial output. Besides, public sector enterprises appear to be utilising their credit limits to substitute for reduced budgetary allocations and private companies are doing the same in place of commercial paper, reduced bills rediscounting facilities, lower order of GDR funds and other similar sources of finance. Experience suggests that while corporate

bodies have begun to adopt a more scientific inventory management methods in the face of heavy interest burden, much of the hoarding and speculation takes place at the traders' level - a phenomenon which has been stimulated by the lackadaisical implementation of the Essential Commodities' Act and other laws governing trading in commodities.

MEDICAL PRACTICE

Controlling Costs

THE parliamentary committee on subordinate legislation has proposed that the government intervene in the matter of remuneration charged by the medical profession for services rendered. The committee has reportedly taken grave note of the exorbitant rates charged by the medical community and sought to regulate and standardise medical fees. The irony is this: on the one hand, the committee is suggesting somewhat drastic changes in a single aspect of the functioning of the medical system; on the other, the changes suggested are such that in order to implement them the very basis on which the private medicare system rests, where medical care is a commodity whose price is determined by market forces, must be altered. Even so, at one level, one may commend the committee for recognising the need for mechanisms to monitor and regulate remuneration for medical services. At another, it is extraordinary that the committee should recommend legislation only with regard to fees and strengthening the Indian Medical Council Act to enable a better regulation of professional qualifications, apparently ignoring the fact that such legislation can only be implemented in the context of a well-regulated private sector, which doesn't currently obtain.

The move to regulate fees charged by private medical practitioners and institutions has come up periodically in several countries. Not surprisingly, it has met with stiff resistance from the medical community. For example, at the time Bangladesh issued its now famous ordinance limiting the number of drugs to be manufactured and sold in the market, the government also proposed an upper limit on private medicare fees and a structure for enforcing the rules. However, so vocal was the medical community on this issue that the Ershad government and the group which had formulated the drug and health policy decided that it was better to give in on this rather than have the drug policy jeopardised. Some degree of monitoring has been possible only in circumstances where there has been a whole-scale restructuring of the medical system, as for instance when Britain introduced its system of health insurance.

What is intriguing is that the subject should have come up now. Quite obviously, numerous studies have shown that incomes of private doctors far exceed what had been assumed to be the case. At the same time, the compression of public health expenditure

is becoming visible in the growing disparity of public services. The growing discontent about the non-availability of public health services and increasingly costly private medicare is being articulated not only by the poor but by the influential middle class as well. The socio-cultural ethos of the middle class, and consequently the organised working class, is also undergoing change so that medical solutions, such as for instance surgery or diagnosis and hospital-based therapies, have become viable options. In a sense, there is greater acceptance of the possibilities of leading a more comfortable life by resorting to medical/surgical interventions. The demand for medical treatment of this nature is also enhanced by the ageing of the population. Added to this is the fact that medical insurance schemes are gaining wider acceptance. The insurance sector has been instrumental in reining in medicare expense in some countries. It is these factors which are driving the efforts to control the cost of medicare, not so much concern for those who desperately need medical help and are increasingly unable to afford it. For, if that had been the case, then the solution would have been to recommend and in fact make it imperative for the government to increase the expenditure on primary (and of course secondary) curative care, together with a greater investment in creating the base for living healthy lives.

MANIPUR

No Easy Peace

LIKE the other states of the north-east, Manipur has been consistently in the news for the violent ethnic conflicts that have engulfed the state for the past couple of years. The Kuki-Naga warfare, which till now has claimed more than 30,000 lives, has been intermittently supplemented by the Muslim-Meitei conflict over land. The deteriorating law and order situation has led to political combinations of all sorts. The last assembly elections of 1990 saw first the formation of a coalition government led by the Manipur People's Party (MPP) which was toppled within two years through defections brought about by the Congress. Later, under the Congress-led coalition government of Dorendra Singh the state witnessed an unprecedented escalation in ethnic violence. The demand for Kukiland, espoused by Kuki militant outfits like Kuki National Army (KNA) and Kuki Defence Force (KDF), was countered by the National Socialist Council for Nagaland (NSCN) by torching Kuki villages in the hill districts of the state. The NSCN ruthlessly pursued its policy of ethnic cleansing in the areas largely inhabited by the Nagas resulting in an exodus of thousands of Kukis to Imphal. The NSCN aims to achieve 'Greater Nagaland' by incorporating the four hill districts of Manipur under the regional head of 'southern Nagaland'. Moreover, the Meiteis who constitute 60 per cent of the population attacked the Muslims fearing the latter

growing encroachment on already scarce land resources. Though Dandendra Singh accused Keishing, a Naga and an ex-chief minister of the state, for fomenting trouble, his plea went unheeded by the central party leadership. Meanwhile, the speaker of the assembly, Borobabu Singh, had also raked up a controversy by summarily disqualifying members of the assembly, making unrestrained use of the anti-defection law. President's rule which was imposed at the beginning of last year failed to improve the situation during its eleven-month duration. Instead, the army became an added irritant in the rapidly spreading conflagration in the state. Rishang Keishing was made the chief minister just two months before the expiry of the last assembly. The only reason for making him the chief minister by hook or crook was that he is a Naga and was considered likely to bring temporary relief to the Naga-Kuki conflict. Perhaps the same calculation persists in making him the chief minister again now.

Yet the deep chasm that has developed amongst the communities after the savage ethnic clashes has resulted in strong anti-Naga feelings among the Kukis and the Meiteis. The election campaigning was conducted along ethnic lines though overtly every party manifesto pledged itself to the territorial integrity of the state. The elections did register a heavy turnout of voters but the fact that 75,000 army men were deployed for a population of 19 lakh, is in itself a comment on the insecurity prevailing in the state. By winning 21 seats as against the 18 seats of Manipur People's Party, the Congress has managed a slender lead over its main rival. The governor has given a month's time for the Congress to prove its majority in the house. But the sudden resignation of Radhabindro Kojima, a close contestant for chief ministership, from the three-member ministry of Keishing and his eventual re-induction as the deputy chief minister ominously signals that political stability cannot easily return to a state that has witnessed so much conflict and bloodshed recently.

BIHAR

Wrong Turn

THE CPI(ML), led by Vinod Mishra, seems to have landed itself in a rather difficult situation in Bihar. Angered by Laloo Yadav's failure to curb violence and atrocities against its mass bases and cadres, the party decided to join hands with the splitaway Samata Party in the forthcoming electoral battles. The Bihar Janata Dal, predominantly backed by the Yadavs, and its splitaway Samata Party, with its major base among the Kurmi and Koori castes, may not be fundamentally different in their political and socio-economic performance. Yet, there is a basis for a distinction between the two in the perception of the CPI(ML)'s mass base in the state. In some of the most notorious cases of violence against the rural poor, it

was the Kurmi landless peasants who instigated and organised the aggression. Even otherwise, the Kurmis, according to declarations of their own accredited spokespersons, are today perhaps the most upwardly mobile segment of the Bihar rural society whose pedestal is invariably constituted by the dalit landless and adivasis. Moreover, when the CPI(ML) had extended its hand of co-operation to the Laloo Prasad government after the last elections, it was in the context of the pervasive Left benevolence towards the Janata Dal. The CPI(ML)'s tilt towards the Samata Party lacks this backdrop. Hence, it is difficult to justify its alliance this time; it is even more difficult to convince the past, present and potential victims of the aggression of the primary social base of the Samata Party about the rationality of that alliance.

All this means that if the CPI(ML)'s breach with Laloo Yadav may have been justified, its linkage with the Samata Party is not. Lured by calculations of electoral gains, the CPI(ML) leadership seems to have forgotten the famous dictum – 'the policy of principles is the best policy'. Whether the party makes any electoral gains from this misalliance remains to be seen; but it is sure to lose in terms of its grass roots strength among the rural poor.

CPI(M)

Existential Pathos

A correspondent writes:

THE rapid, whirling transformation which is now the hallmark of the so-called developing societies is making the task of running political parties or setting into motion political processes of any durability extremely daunting: it continuously nibbles at their relevance, demanding from political leaders intellectual suppleness of a very unusual order. In our country, the most paradoxical and hypocritical demonstration of this suppleness has come from the CPI(M): paradoxical, because the party has introduced economic liberalisation in West Bengal in contravention of its political philosophy; hypocritical, because it has attempted to justify this policy while retaining in theory its standard ideology.

Viewed in isolation from the surrounding reality, this suppleness on the part of the CPI(M) will project itself merely as pathetic acrobatics; placed in the midst of this reality, it may come across as an intelligent response to a complex situation. By behaving in this particular manner, the CPI(M) may have saved itself from total redundancy. Yet this after-life – so to speak – that the CPI(M) has salvaged for itself is not without its existential pathos: independently of the party it once gave life to, it would live on, like a ghost without a body, hoping for 'nirvana' or, if that is not possible, waiting to be infused into a new body, a new party.

What is more likely is that the CPI(M) would itself become that body, that party,

like its counterparts in the post-Soviet eastern and western Europe. Much more than just changing its name, involved in that would be a willingness to transform itself into a genuinely democratic party while retaining its socialist roots. This transformation would nevertheless be a treacherous engagement: rather than preserving their egalitarian roots, the former communist parties tend to nurse their authoritarian moorings while failing to avoid the trap of right-wing liberalism which, in its economic ideology, borders on neo-conservatism. This is what has happened with, what still calls itself, the Communist Party of China. Add to this the possibility that the ex-communist parties may also begin finding it expedient to champion the cause of majority nationalism – in Russia, the former CPSU has failed to condemn the attack on Chechnya – and we have a political practice somewhat similar to pre-war national socialism.

The conditions that may prevent CPI(M) from turning into a national socialist monster, like the ones that pushed it towards economic liberalism, remain external to its apparatus: it functions in a country where the paraphernalia necessary for at least a liberal democratic state is in place, and where the notions of socialism and a liberal nationalism – in theory – are still intact. However, this would require CPI(M) to make a few more intellectual leaps.

SRI LANKA

Peace Prospects

SRI LANKA celebrated the 47th anniversary of its independence from British rule with a great deal more optimism than perhaps ever in the last decade. In the recent past the ethnic conflict in the north-east has loomed large over the country's economy, thwarting all attempts at stability in the political sphere or growth of the economy. It is a price that Colombo has had to pay for its earlier long and often deliberate neglect of the region. Although several attempts have been made in recent years to get the LTTE to the conference table, the several declarations of ceasefire have never held, with accusations and counter-accusations about who had been the first to break it. Moreover, the LTTE has sought pre-talk concessions which Colombo has adamantly refused to deliver, and even when it has, such as minimal withdrawal of troops, etc, the LTTE has walked away from the negotiations with its undiluted demand for a separate Tamil 'eelam'. This has given rise to a conviction among a section of political leaders that the LTTE is not serious about a political solution and that it will use all offers of talks to wrest concessions and reinforce itself.

Not surprisingly then, when Chandrika Kumaratunga decided, as among her first tasks after taking office as prime minister, to lift the embargo on movement of certain goods to the north-east, she spread more gloom than joy among political leaders, including from her own party. She also

made clear that this was a gambit in her attempt to get the LTTE to parley. That it was genuinely appreciated by the local population and brought gains to Kumaratunga also registered with the Tigers. It was after all for the first time that Colombo had even acknowledged the day-to-day needs of the people of the region. And for the Tigers, this was an important factor to take into consideration. But the tentative beginning was halted abruptly when the LTTE allegedly let loose its terror tactics with the assassination, on October 24 last year, of the opposition candidate in the presidential elections, Gamini Dissanayaka. Kumaratunga was forced to abandon temporarily all truce moves. However, after her victory in the presidential election, she has put in place further measures. For example, the LTTE's long-standing demand for reopening the Elephant Pass was acceded to when the government assured safe passage through the Pooneryn-Sangupittu route for civilians at the time of the visit of the Pope.

All this has led to a ceasefire from January 8, the creation of a 400-metre demilitarised zone and the constitution of an international team to monitor the truce. According to all reports the LTTE has agreed to a plan for an autonomous regional arrangement, although neither the LTTE supreme nor Kumaratunga have expressly made a statement in this regard. The situation has been repeatedly described as being 'hopeful' by Colombo. The government has also prepared a detailed plan for rebuilding of the northern province. Norway and Netherlands have deputed representatives for the monitoring committee and the International Red Cross has agreed to play a neutral and mediatory role. By the middle of January, three rounds of talks had been held, but there are several sticky points.

For one thing, the LTTE is clearly wanting to marginalise the military in these efforts. For instance, on the issue of the reopening of the land route, the government has been proposing that the military be withdrawn from the immediate route and monitoring of civilian movement be suspended. The LTTE has been adamant that the military camp in the area, one of the most strategic, be dismantled entirely. Another contentious issue has been that while the LTTE has been allowed free movement in the region, it has not been allowed to carry arms. The army points out that the LTTE has been reneging on this undertaking and has been tightening its hold over the eastern region. As a matter of strategy, at the height of the hostilities, the Sri Lankan army had, with a great deal of publicity, concentrated its campaign in the north, forcing the LTTE to withdraw forces from the eastern region, which were subsequently taken over by combined police and army operations. Now the army is crying itself hoarse pointing out that these military gains are being given away and that in the event of a resumption of hostilities the LTTE would have gained the upper hand. There are many in and out of government and in the army who believe that such a situation is imminent. They point out, for instance, that

the international monitoring team has not yet been put in place despite the fact that the two foreign representatives have already arrived but are encountering difficulties from the LTTE end.

While it is hard to say what gives Kumaratunga and her lieutenants the confidence to persist in the peace process, the political and economic imperatives are obvious enough. Neither economic nor political stability is achievable in Sri Lanka unless the north-eastern conflict ceases. But there is a problem nobody wishes to address yet: even if the ceasefire holds and a political solution is hammered out, transforming the ethos of a population which has been metaphorically on the run, either from the LTTE or the Sri Lankan forces, is not going to be either easy or quick. And this is where the numerous NGOs working in the region will play a crucial role. The LTTE is well aware of this and has in fact suggested that the NGOs come under some sort of monitoring - with itself of course playing a dominant role in the process. When peace finally comes to the north-east, it will bring with it a layer of non-official agencies which need to be accorded a definite role and location even now.

SOUTH AFRICA

Continuity over Change

A correspondent writes:

AN astonishing observation of Nelson Mandela, president of South Africa, made in the course of a recent interview to an Indian correspondent, deserves closer examination. According to the interview (*The Hindu*, January 13), Mandela is reported to have said, responding to a question about the role of the old regime in South Africa in the 'abortive intervention' in Seychelles, that "it was not intervention by South Africa, it was intervention by a group of mercenaries".

Such a perception is not even technically correct. It is true that the 'abortive intervention' in November 1981 was by a group of multinational mercenaries, masquerading as a rugby team, and was led by the well known mercenary, Mike Hoare. The group made a hash of the affair and later hijacked an Air India plane and forced it to fly to Durban where the authorities had no option but to arrest the mercenaries. Further, as if to disassociate itself from such activities, the then South African regime tried the mercenaries before the Natal Supreme Court which awarded all of them, including Mike Hoare, stiff sentences.

But none of this means that the affair was merely a 'caper', an initiative autonomously undertaken by a bunch of adventurers (in return for payment, of course) to secure the restoration of the discredited James Manchan regime. The account of the affair written by Mike Hoare after his release from prison makes several revelations concerning the deep involvement of the South African

Defence Force, which was the Natal Intelligence Service (NIS) in equipping and financing the affair. Even if these revelations were self-serving and so deserved to be discounted, the fact is that the Natal Supreme Court too upheld many of these claims made by and on behalf of the mercenaries. Among other things, the court established, in the course of the trial, that the mercenaries had drawn their weapons and equipment from SNDF stores; that these had been delivered to them in a South African army truck; that the deliveries were acknowledged to have been received on SNDF stationery. The invading force comprised serving members of the SNDF as well as a member of the NIS. The mercenaries had held discussions on the planned *coup* with senior SNDF officers. In the words of the judge president of the Natal Supreme Court: "It would be naive to suggest that the Natal Intelligence Service was not aware... It is impossible to escape the conclusion that the delivery of the AK47s and other equipment followed upon his [Mike Hoare's] contact with these brigadiers... The court must therefore accept that certain members of the South African defence force had lent aid and support to this operation."

That such initiatives by the SNDF and the NIS could not have been taken without political clearance at the highest level is a reasonable inference from these juridically established facts. The liberation movement in South Africa as well as democratic opinion throughout the world had severely criticised the South African regime for its attempt to destabilise the government of tiny Seychelles headed by Albert Rene, who had lent open support to the liberation movement, and restore the discredited regime of James Manchan who had virtually leased out the island to pleasure-seeking white South Africans as a sybaritic paradise.

With all these facts known for long, Mandela appears to be reluctant to assign to the old regime its proven role in the *coup* attempt. According to him, the whole enterprise was undertaken by 'a group of mercenaries'. Such eagerness to exculpate the old regime of its crimes abroad is of a piece with the ambivalence of sections of the leadership in the new South Africa towards the old regime's crimes within the country. The draft Bill on the Truth and Reconciliation Commission (TRC) introduced in parliament has come under criticism because several crucial provisions - like the one providing for in-camera hearings of indemnity applications - are watered down versions of what was originally intended, indeed promised, by the ANC. While these individual instances of possible backsliding may perhaps be considered as necessary compromises in order to achieve national reconciliation, the extraordinary sensitivity towards the old regime as a structure, even to the extent of overlooking its proven crimes, suggests that the balance between continuity and change in the transition from the old to the new South Africa appears to be tilted in favour of the former.

ASIAN PAINTS

Spurred by Excise Cut

ASIAN PAINTS, the market leader in the decorative paints segment, has done well in 1993-94 after a lean performance in the previous year. The company controls about 40 per cent of the decorative paints market and about 14 per cent of the industrial paints market. Net sales were up by 10 per cent (Rs 36.19 crore), operating profit by 11 per cent (Rs 6.16 crore) and net profit by 31 per cent (Rs 6.15 crore). Reduction in excise duty by 10 per cent in the last two years helped the company to pass on the benefit to its customers in the form of reduced price. Increase in taxation by 32 per cent was offset by decrease in depreciation and interest charges by 10 per cent and 23 per cent, respectively. Non-operating profit increased by 33 per cent while income increased by 108 per cent. A dividend of 50 per cent was declared for the year against 33 per cent in the previous year. Imports and exports increased by 39 per cent and 25 per cent, respectively.

Debt-equity ratio fell sharply to 13 per cent from 41 per cent in 1992-93 and 46 per cent in 1991-92. Sundry creditors to current assets has been steady at 4 per cent for the past three years. Sales to total assets fluctuated at 137 per cent in 1991-92, 144 per cent in 1992-93 and 139 per cent in 1993-94, while sales to gross fixed assets fluctuated at 322 per cent in 1991-92, 318 per cent in 1992-93 and 325 per cent in 1993-94. Inventories to sales ratio fell to 19 per cent in 1992-93 from 25 per cent in 1991-92 and has remained steady at 19 per cent in 1993-94. Raw material consumed to value of production has fluctuated in the past three years at 67 per cent in 1991-92, 65 per cent in 1992-93 and 66 per cent in 1993-94. Return on investment has bounced back to 17 per cent after a fall in 1992-93 to 15 per cent. Earning per share fluctuated at Rs 17 in 1991-92, Rs 9 in 1992-93 and Rs 12 in 1993-94. Net value added to value of production after being steady at 18 per cent during 1991-93 fell to 17 per cent in 1993-94. Remuneration to employees has remained steady at 27 per cent for the past two years.

The company continued direct import of tin plates to ensure the availability of containers. Domestic sales grew by 8 per cent with the paints division growing by 14 per cent. Sales of the phthalic division were lower by Rs 13 crore due to planned maintenance shut-down of the plant for 25 days and also due to lower selling prices. Paints were exported to new markets in West Asia and to certain countries in Africa; export of phthalic anhydride was limited due to unremunerative international prices.

Asian Paints has subsidiaries in Fiji, Tonga, Solomon Islands, Nepal and Vanuatu. Except

for the subsidiary in Vanuatu, all the other subsidiaries have done well for the year. The company is setting up a joint venture in Queensland, Australia, for the manufacture of paints, enamels and varnishes.

The company invested Rs 266 lakh in research and development activities in 1993-94. Development of new products and processes through innovations in surface coating materials and intermediates, cost reduction, technology upgradation, absorption and indigenisation of imported technology, development of tailor-made products for the export market, various industrial and high performance paints to meet the specific requirements of OEM customers are some of the activities of the department.

BARODA RAYON

Turn-Around Sustained

Baroda Rayon Corporation has done well in 1993-94 after doing badly in the earlier two years. The company incurred losses in 1991-92, but in 1992-93 marginal profitability was achieved. In 1993-94, the company did well with net profit increasing by Rs 30.31 crore, net sales by Rs 35.45 crore and operating profit by Rs 50.78 crore. Depreciation and interest charges were lower by Rs 3.67 crore (19 per cent) and Rs 3.55 crore (16 per cent), respectively. Other income fell by 8 per cent, while non-operating profit was up by Rs 8.30 crore. After a gap of two years the company declared a dividend of 20 per cent for the year. Increase in sales can be attributed to increase in exports by Rs 13.46 crore. Imports fell by 32 per cent (Rs 8.88 crore).

Consumption of raw materials to value of production fell steadily from 54 per cent in 1991-92 to 47 per cent in 1992-93 and 38 per cent in 1993-94. Export to sales ratio rose sharply from .55 per cent in 1991-92 to 4 per cent in 1993-94. Inventories grew by 21 per cent in 1993-94. Gross saving to gross capital formation increased from 13 per cent in 1992-93 to 136 per cent in 1993-94. Debt-equity ratio declined sharply from 200 per cent in 1991-92 to 116 per cent in 1992-93 and 67 per cent in 1993-94. Short-term bank borrowings to inventories fluctuated at 35 per cent in 1991-92, 49 per cent in 1992-93 and 41 per cent in 1993-94. Return on investment rose by 9 percentage points for the year as against 8 per cent in 1992-93. Earning per share rose to Rs 98 in 1993-94 from Rs 1 in 1992-93. Sundry creditors to current assets fell steadily from 43 per cent in 1991-92 to 40 per cent in 1992-93 and 29 per cent in 1993-94. Net value added to value of production rose from 11 per cent in 1991-92 to 19 per cent in 1992-93 and 30 per cent in 1993-94. Remuneration to employees declined over the three years from 58 per cent in 1991-92

to 38 per cent in 1992-93 and 31 per cent in 1993-94, but remuneration to employees as a ratio of value of production after being steady at 10 per cent during 1991-93 increased to 11 per cent in 1993-94.

The company maintained high production levels in rayon, nylon and POY. Capacities at the nylon tyre plant remained underutilised due to demand constraint which was a result of availability of imported tyre cord at cheaper rates.

Expansion of capacity of POY spinning to 15,000 tpa and polycondensation to 12,500 tpa is on. Modernisation/expansion of rayon plant is being considered. Installation of a state-of-the-art power generating system to increase in-house capacity to 34 MW is being planned.

ATUL PRODUCTS

Rise in Profit

Atul Products, manufacturers of acid and direct dyestuffs, sulphur dyestuffs, caustic chlorine, para cresol, etc, seems to have overcome the problem resulting from excess capacity. Net sales have risen by 12 per cent (Rs 24.09 crore), operating profit by 23 per cent (Rs 6.18 crore) and net profit by 103 per cent (Rs 7.24 crore). Depreciation fell marginally by 2 per cent, while interest charges were up by 5 per cent for the year. Non-operating profit rose sharply by Rs 1.52 crore (220 per cent), while other income rose marginally by Rs 20 lakh (.93 per cent). An enhanced dividend of 27.5 per cent was declared for the year against 25 per cent for the previous year. Exports and imports were up by 17 per cent (Rs 8.16 crore) and 30 per cent (Rs 4.16 crore) respectively.

Short-term bank borrowings to inventories after being steady at 22 per cent from 1991-93 fell to 21 per cent in 1993-94. Sundry creditors to current assets fluctuated at 22 per cent in 1991-92, 29 per cent in 1992-93 and 18 per cent in 1993-94. Gross saving to gross capital formation rose from 2 per cent in 1991-92 to 12 per cent in 1992-93 and 66 per cent in 1993-94. Raw materials consumed to value of production has been steady at 29 per cent for the past two years. Return on investment fluctuated at 7 per cent in 1991-92, 6 per cent in 1992-93 and 8 per cent in 1993-94. Earning per share fluctuated at Rs 7 in 1991-92, Rs 5 in 1992-93 and Rs 8 in 1993-94. Debt-equity ratio fell by 61 percentage points in 1992-93, but has now risen by 15 points in 1993-94. Net value added to value of production was steady at 17 per cent in 1992-93 and has now risen by 2 percentage points. Remuneration to employees rose by 10 percentage points in 1992-93 and fell by as much in 1993-94. Growth in inventories fell by 32 percentage points for the year. Sales to total assets and

sales to gross fixed assets have shown a steady decline in the past three years.

Raw materials were readily available. Increase in the prices of certain raw materials was offset by decrease in prices of certain others. The decision to generate power for its own consumption resulted in saving. Generation of steam through coal and lignite in replacement of costly LSHS oil enabled the company to generate electricity economically.

The modernisation of the caustic chlorine and azo dyes plants, expansion of sulphur black capacity and upgradation of the Diuron plant were completed during the year. Work relating to capacity expansion of chemicals and dyestuffs and de-bottlenecking of plants for the manufacture of intermediates and cresol also started during the year.

An investment of Rs 155 lakh was undertaken in the year under review for R and D activities which were carried on in the areas of dyestuffs, bulk drugs and agro-chemicals and intermediates in addition to natural product extractions for development and improvement of new processes.

BAJAJ HINDUSTHAN

Higher Return on Investment

Bajaj Hindusthan has done well in 1993-94, with net sales increasing by 5 per cent, operating profit by 792 per cent and net profit by 483 per cent. Taxation fell by 80 per cent, interest charges by 40 per cent and depreciation by 48 per cent. Other provisions increased by Rs 50 lakh. Other income rose by Rs 89.97 crore, while non-operating income was up by Rs 33 lakh. The company declared a 10 per cent dividend for the year. Imports rose by 66 per cent.

Debt-equity ratio fell sharply from 226 per cent in 1991-92 to 198 per cent in 1992-93 and 39 per cent in 1993-94. Short-term bank borrowings to inventories rose steadily from 37 per cent in 1991-92 to 42 per cent in 1992-93 and 52 per cent in 1993-94. Sundry creditors to current assets fluctuated at 33 per cent in 1991-92, 35 per cent in 1992-93 and 16 per cent in 1993-94. Return on investment rose by 43 percentage points for the year. Raw material consumed to value of production rose from 45 per cent in 1991-92 to 50 per cent in 1992-93 and 51 per cent in 1993-94. Earning per share rose sharply. Net value added to value of production fluctuated at 14 per cent in 1991-92, 9 per cent 1992-93 and 72 per cent in 1993-94. Remuneration to employees fluctuated at 39 per cent in 1991-92, 50 per cent in 1992-93 and 11 per cent in 1993-94. Inventories to sales fell from 74 per cent in 1991-92 to 49 per cent in 1992-93 and 37 per cent in 1993-94.

The company successfully completed its modernisation-cum-expansion project and the plant was commissioned in March 1994 with an increased capacity of 5,000 TCD.

The distillery division did not do well due to shortage of molasses for production of industrial alcohol which was the result of the imposition by UP government of control on molasses, bringing 65 per cent under levy. The company sold off its cement division which was incurring losses.

CESC

Raised Tariff

Calcutta Electric Supply Corporation (CESC), the RPG group power company, has shown good performance in 1993-94. Net sales went up by 15 per cent, operating profit by 13 per cent, and net profit by 73 per cent. Other income went up by 57 per cent for the year, non-operating income fell by Rs 11 lakh, interest charges fell by 3 per cent while depreciation rose by 5 per cent for the year. Imports were up by Rs 26.90 crore. The company declared a dividend of 30 per cent for the year as against 25 per cent in the previous year.

Debt-equity ratio fell drastically from 366 per cent in 1991-92 to 359 per cent in 1992-93 and 68 per cent in 1993-94. Net value added to value of production rose steadily from 26 per cent in 1991-92 to 27 per cent in 1992-93 and 28 per cent in 1993-94. Short-term bank borrowings to inventories fell from 133 per cent in 1991-92 to 94 per cent in 1992-93 and 91 per cent in 1993-94. Sundry creditors to current assets fluctuated at 46 per cent in 1991-92, 34 per cent in 1992-93 and 35 per cent in 1993-94. Sales to total assets fell from 65 per cent in 1991-92 to 59 per cent in 1992-93 and 25 per cent in 1993-94. Sales to gross fixed assets fell from 71 per cent in 1991-92 to 64 per cent in 1992-93 to 25

per cent in 1993-94. Growth in inventories fell from 133 per cent in 1991-92 to 32 per cent in 1992-93 and 3 per cent in 1993-94. Gross saving to gross capital formation rose by 6 percentage points in 1992-93 but has now fallen by the same in 1993-94. Return on investment fluctuated at 3 per cent in 1991-92, 4 per cent in 1992-93 and 2 per cent in 1993-94. Earning per share increased in the past three years from Rs 7 in 1991-92 to Rs 8 in 1992-93 and Rs 15 per share in 1993-94.

Total power generation increased by 67 million units in the year. Energy sales increased by 4.14 per cent. The company revised its power tariff to which the industry reacted sharply, though the company justified its action by claiming rise in the cost of coal and railway freight. CESC, the wholly owned subsidiary of the company, achieved a total turnover of Rs 204.40 lakh. The gas turbine station at Kasba is being renovated and overhauling of one unit has been completed. Work on the Budge Budge project for strengthening generation capacity has made substantial progress. The company plans to commission the first unit by the first half of 1996. The company proposes to set up a thermal power station at Balagarh in three stages. Under frequency tripping has been commissioned in the eastern grid as a protective measure to prevent grid collapse following loss of generation.

The company invested Rs 10 lakh on R and D activities in 1993-94 against Rs 5 lakh in the previous year. Development of digital equipment, introduction of modern tools/equipment and simplified joint system and various innovations in the attachment and parts of outdoor equipment for extra safety were some of the activities of the department.

TRAINING FOR DEVELOPMENT ANALYSIS AND ACTION

Conducted by :

**Behavioural Science Centre
Ahmedabad
&
Navsarjan
Surat**

A 21 week, post graduate residential programme for personnel of voluntary organisations and those interested in development action. The course begins on 1st September, 1995 and integrates theoretical understanding, personnel growth and field experience. Limited financial and placement support.

Write for details to :

**Course Coordinator,
Behavioural Science Centre,
St. Xavier's College,
Navrangpura,
Ahmedabad - 380 009.**

Last date for application 30th April, 1995.

CURRENT STATISTICS

Research Foundation

Commodity prices have registered all round increases in recent weeks even as reserve money and money supply growth has been moderated. Over the past month there has been an unusual 3.4 per cent decline in reserve money. Simultaneously, non-food advances are galloping. Foreign exchange reserves (other than gold) have touched \$ 19.77 billion. The havalra rate has been reported at above Rs 36 per US dollar. Money market is becoming increasingly tight with call money rates remaining very high and primary as well as secondary market yield rates firming up. Prime rates of banks and financial institutions have been raised in response, generally by a full percentage point to 15-15.5 per cent.

No Right to Vote

A G Noorani

How can the election officials explain the deletion from the 1995 electoral rolls of persons who had diligently exercised their franchise in every election since independence? Instead of admitting their lapse, they are using Form 6 as provided under the Registration of Electors Rules as a fig-leaf.

THE impressively high turn-out of voters should not obscure the fact that, as *The Times of India* reported on February 13, "tens of thousands of legitimate voters from several localities, most of them photo-identity card-holders, could not vote because their names did not figure in the 1995 electoral rolls". The chief electoral officer of Maharashtra, D K Shankaran, had a ready explanation for this: "The decision of the polling officer to restrain them from exercising their franchise was correct. The first list of voters was published in July 1994, after completing the work of photo identity cards. As per the directives of the election commission, the electoral register was revised in 1995 and necessary instructions were given to the entire electorate to ensure that their names were in the latest register. The names of such voters who did not bother to help the administration to update the electoral register did not figure in the latest list."

The returning officer, B R Pokharkar, provided the details. Identity videography began in September 1994 on the basis of the January 1994 electoral rolls. But a fresh enumeration of voters was done between July 15 and August 28, 1994. The fact was widely publicised. Voters were asked to ensure that they figured in the new electoral list. If not, they were asked to fill up Form 6. The new electoral roll was publicised between October 25 and November 24, 1994. The 1995 electoral rolls were frozen on January 7, 1995. Added Pokharkar, "Most voters become aware of this only on voting day. They do not care about the procedure on time." The onus was, therefore, on the voters who did not care enough to verify the fresh rolls after October 24, 1994, according to the returning officers of all constituencies which reported a fair number of deleted names.

Some arrogance and insensitivity! It was compounded by plain silliness:

When our enumerators ring their door-bells, first the dog appears at the door,

then the servant who promises to fetch the 'mehsaheb' only to come back and say she is resting and cannot be disturbed. What, then, are we supposed to do?

How many in Bombay keep dogs and have 'mehsahebs'? It is men like Pokharkar who give the bureaucracy a bad name for indifference to citizens' problems. Be it remembered that this time around political parties did not distribute polling slips or cards with the voters' names and numbers on the electoral roll, the addresses of the polling booths, etc., to the extent they did formerly.

Other election officials spoke in a similar vein. "All this happens due to ignorance and lethargy on the part of the voter", said Uttam Kholvagade, Bombay suburban district collector. One wonders how to characterise the failure to deliver photo identity cards to voters who did bother to get themselves photographed. Or, for that matter, the deletion of names of 'tens of thousands' of voters. How do these officials explain the deletion from the 1995 roll of persons who had diligently exercised their franchise in every election since independence? Whose 'ignorance and lethargy' were responsible for the denial of their right to vote in 1995, theirs or the election personnel's?

The Representation of the People Act, 1950 provides for the preparation of electoral rolls and registration of voters. Section 22 provides for correction of entries in electoral rolls by the electoral registration officer. It obligates him explicitly to "give the person concerned a reasonable opportunity of being heard" if the officer purposes, *inter alia*, to delete his name.

Section 23 enables a person whose name is not included in the electoral rolls of a constituency to apply to the electoral registration officer for the inclusion of his name in that roll. Section 28 confers on the central government power to make rules. Section 30 bars the jurisdiction of civil

courts. But this affects only civil suits. No statute can affect the writ powers of the high courts under article 226 of the Constitution.

The Registration of Electors Rules, 1960 provide the details. Rule 13 prescribes Form 6 for persons claiming inclusion of their names. Is it seriously suggested that the entire electorate should lay siege to the office of the electoral registration officer to see whether their names are included or not? The law does not dispense with the need for exercising intelligence while construing a statute. The law is based on the supposition that officials as well as citizens act with due sense of responsibility. In any case, there is no justification for any deletion without notice. Highly educated persons of known civic commitment say that they received no such notice and that they had exercised their franchise in the past. Obviously, it is the electoral registration officer's men who have bungled. Instead of admitting that, senior officials are using Form 6 as a fig-leaf to conceal their lapse.

The fact that the law is deficient in providing redress makes matters easy for them. In India the right to vote or to stand as a candidate for election is neither a fundamental right nor a civil right, but a statutory right exercisable in the manner laid down in the statute. Article 325 of the Constitution provides only that no person shall be ineligible for inclusion in an electoral roll on grounds only of religion, race, caste or sex. It provides against disability on these grounds. It confers no right as does the International Convention on Civil and Political Rights in article 25(a). It says: "Every citizen shall have the right and the opportunity... without unreasonable restrictions... (a) to vote and to be elected at genuine periodic elections..." India has ratified this covenant and is bound to account periodically to the Human Rights Committee, established by the covenant, for observance of the provisions of the covenant.

In the meetings of the Constituent Assembly's advisory committee on fundamental rights, minorities, and tribal and excluded areas, B R Ambedkar was emphatically of the view that adult franchise and all provisions for its free and fair exercise should be in the nature of fundamental rights. All except Rajaji agreed with him. But eventually Rajaji carried the day - to our loss.

Resource Mobilisation for New Welfare Programmes in Andhra Pradesh

J V M Sarma

The recent election outcome in Andhra Pradesh does reflect the popular mood to have safety net schemes for the poor in the wake of the liberalisation and globalisation programmes taken up by the central government. However, unless fundamental changes are brought about in the state fiscal administration along with proper targeting and rationalisation of the rice subsidy scheme, it is extremely difficult to cope up with the impending fiscal crisis. In a way, the present crisis should be welcomed as it has created a sense of urgency to speed up the process of the long-pending fiscal reform in the state.

THE welfare schemes announced by the new government in Andhra Pradesh have raked up considerable controversy. The food subsidy scheme in particular, popularly known as the 'two-rupee-kilo-rice' scheme, is seen in some circles as an election stratagem used by the Telugu Desam party to capture political power. While it is debatable whether the election success can be entirely attributable to the promise of rice subsidy since the Congress Party had also promised a similar scheme albeit on a modest scale, in a broader sense, the outcome does reflect the popular mood to have such safety net schemes in the wake of the liberalisation and globalisation programmes taken up by the central government.

The question is how far the rice subsidy scheme, along with the other equally important welfare scheme promised by the new government, namely, prohibition, is implementable in the face of the rather precarious financial position of the state. This note is aimed at exploring the possible alternative ways of raising the resources for these schemes without unduly affecting the longer term developmental activities in the state.

In a way, the present crisis should be welcomed as it has created a sense of urgency to speed up the process of the long-pending fiscal reform in the state. Unless fundamental reforms are undertaken on the revenue and expenditure fronts, along with proper targeting and rationalisation of the rice scheme, it is extremely difficult for the state government to cope with the impending fiscal crisis.

NEED FOR NEW WELFARE PROGRAMMES

It is well recognised that during the initial years of the economic reforms, the poor would be the hardest hit and that social safety nets are required to protect them from the possible adverse impact. The two most important threats from which the poor needs protection are inflation and unemployment.

Several measures were introduced during the last three years in the union budget as part of the structural adjustment and globalisation policies with a view to encouraging industrial growth; steep reduction in customs duties on industrial raw materials and in excise duties, introduction of *ad valorem* duties, lowering of interest rate, reduction of corporate tax and income tax relief. All these measures have led to huge budgetary deficits. The burden of the deficit-induced inflation is felt more by the poor. Added to this is the pruning of the subsidies by reduction in the allocation for irrigation, reduction of subsidies to small and marginal farmers, and the upward revision of the administered prices of several commodities.

Consequently, although the inflation rate was earlier brought down from a peak level of 17 per cent per annum to a reasonable 10 per cent, during 1991-92, 1992-93 and 1993-94 the wholesale price index has risen by 12 per cent, 13.25 per cent and 9.5 per

cent, respectively. Whether there will be any further price rise in the future remains to be seen, but the situation as it exists today already causes alarm.

As regards the unemployment situation, if the experience of countries following the World Bank models is any indication, the capital intensive technological upgradations adopted as part of the new economic policies have worsened the unemployment situation in the country. It is observed that during the past decade and a half, while the rate of growth of gross domestic product has gone up from 3.5 to 5.3 per cent, the employment growth has fallen from 2.8 to 1.6 per cent, the decline being even sharper in agriculture, from 1.8 to 0.07 per cent. It is estimated that every year roughly 8 million persons enter the job market in the country.

Although we are assured by the government that the price rise and the growth of unemployment is a short run phenomenon, there is need to reorient the policies towards minimising the burden of inflation on the poor and also have a clear focus on employment generation. The government has recognised the need for a human face even at the time of the commencement of the structural adjustment programme. It in fact set before itself as one of the most important tasks, "to address more effectively the problems of poverty, unemployment and social deprivation which affect a large mass of our people, particularly in rural areas."

The consequent enhancement of the budgetary allocations to rural development programmes, especially during 1994-95, do reflect the government's concern. A large part of the increase in the outlays on rural development programmes is in the nature of schemes for providing social security for that segment of the population which is discriminated against in the development process.

TABLE 1: STATUTORY AND EFFECTIVE SALES TAX RATES IN AP
(By Important Revenue Yielding Commodities)

(Per cent)

No	Name of the Commodity	Effective Tax Rate (tax revenue/ gross turnover)	Statutory Basic Rate	Combined Tax Rate with Additional Tax of 1.5 Per Cent and Surcharge of 10 Per Cent
1	Petroleum products	15	18	21
2	Cement	6	10	11
3	Fertilisers and bone meal	3	3	3
4	Electrical goods	4	10	11
5	Drugs and medicines	3	8	9
6	Others	2	6	6
7	Tyres and tubes	8	7	7
8	Cosmetics	5	10	11
9	Machinery	4	6	6
10	Paper	3	7	7
11	Tea, coffee	5	6	6
12	Chillies	4	5	5
13	Edible oils	2	6	6

First, the per capita sales tax as also the ratio of sales tax to GDP in AP are just about average compared to other states (Figures 4 and 5). The large agricultural content and primary sector content which, for various reasons, is either exempt or taxed at a very low rate, could, but partly, explain the low level of taxation.

Second, the effective tax rates (tax collections as proportions to corresponding gross turnovers) in respect of several commodities are considerably lower than the corresponding statutory tax rates derived by combining the different components, namely, the basic tax rate (GST), the additional tax rate, and the surcharge. The wide difference between the statutory and the effective tax rate is partly due to the plethora of exemptions, incentives, etc. This, however, is not to suggest that all the exemptions and incentives should be done away with as they reflect various social welfare objectives of the state. However, reviewing and restructuring of these exemptions and incentives may yield substantial additional revenue.

Third, the report by Sarma, Bagchi and Mehta⁴ as well as the Interim Report of the Chelliah Committee⁵ contain recommendations for various measures of rate rationalisation. While the former suggested merging of the additional tax and surcharge and combining into one tax rate for each commodity group, the latter has recommended regrouping of commodities to reduce the number of tax rates to four, and adoption of VAT system. Rough calculations show that a four-rate (4 per cent, 9 per cent, 11 per cent and 13 per cent) and a special rate of 27 per cent for petroleum products, a VAT system, with drastically reduced incentives and exemptions can generate substantial additional revenue (Tables 1 and 2). The rate-rationalisation will also bring about the much needed transparency in the tax system leading to improved tax compliance and higher revenue. It can be seen that these proposed rates are not much different from the present rates and also those proposed by the Chelliah Committee in its Interim Report. Thus, the time is

opportune now to bring about the much needed higher tax rationalisation.

Agricultural income or holdings base contains some scope for widening the tax base in many states including AP. As noted above, an important reason for the low per capita sales tax or the low sales tax to GDP ratio in AP as compared to industrialised states such as Gujarat and Maharashtra is the large content of agricultural commodities in the sales tax base and the relatively lower sales tax rates on such commodities. Commodities like rice and cereals come under the category of 'declared' goods the rates on which are not allowed to exceed the central sales tax rates. Consequently, states such as AP with large agricultural base are at a disadvantage.

Also, the only tax touching the agricultural sector so far has been land revenue, the productivity of which over the years has dwindled to a negligible level in AP. One way to compensate for the low sales tax potential from the agricultural sector and for the loss in land revenue is to levy the agricultural income or holdings tax in the state. While there exists near unanimity on the need to impose heavier taxation on the agricultural sector, it is surprising that a workable mode of taxing the agricultural sector has not yet been found. The tax as recommended by the Raj Committee⁶ no doubt involved many administrative problems. But nothing prevents the state governments from making innovations such as the one suggested by Bagchi.⁷ In spite of various schemes and modifications suggested, the state government's reluctance to go for agricultural taxes has to be attributed to political compulsions.

The scope for improving the revenue from other tax sources such as the stamp duties, motor vehicles tax and entertainment tax as also from the non-tax sources is very little.

Notes

Restructuring Banks' Capital

Need for an Integrated Approach

N P Kurup

Restructuring of banks' capital has to be done after a careful consideration of all the implications and not as part of hasty, half-baked schemes of partial privatisation. An outline of an integrated scheme for banks' capital restructuring.

TO get out of the muddle of partial privatisation, about which I wrote earlier (EPW, September 10, 1994), the government has promulgated the Banking Companies (Acquisition and Transfer of Undertakings) Amendment Ordinance on January 21. The ordinance became urgent to facilitate finalisation of the balance-sheet and profit and loss statement of Punjab National Bank, which unwittingly became a victim of structural reforms in the banking sector. On the merger of New Bank of India with PNB in September 1993, PNB came to be saddled with New Bank's accumulated losses of about Rs 430 crore. The perfunctory amalgamation scheme contained no provision about the manner in which the losses have to be absorbed. But PNB took a firm stand that notwithstanding the 100 per cent government ownership of both the banks, the losses should be borne by the government retrospectively from the date of merger. Pending acceptance of its demand, the bank did not finalise its accounts as on March 31, 1994.

The ordinance conceded PNB's demand. The special provision meant for PNB in the ordinance is that the loss arising out of amalgamation of another bank can be reduced from the capital with retrospective effect from the date of merger. It is the ordinance that enabled Rashid Jilani, CMD of PNB, to announce at the belated inauguration function of the bank's centenary celebrations held on January 28 that the bank will be showing substantial profits during 1993-94. Referring to the situations like the one in which PNB was placed, I wrote in September that "in such situations, the chief executives of the organisations have a wider responsibility going beyond complying with the wishes of the government; they have to display qualities of professional leadership of the organisation" (EPW, September 10, 1994). Rashid Jilani rose to the occasion and deserves all compliments, for a still more important reason also. At the function, addressing a gathering of about a thousand people, none of whom was below the poverty line, the PNB chairman stated in

the presence of union finance minister and RBI governor that poverty alleviation lending is not contradictory to profitability of banks. What the country needs is the PNB model of socially responsible and profitable banking and not one decrying social responsibilities and reciting the mantra of profitability and privatisation.

The ordinance envisages reduction in bank capital by three authorities. It empowers (1) the central government, in consultation with the RBI, to cancel capital of wholly-owned government banks against their losses; (2) the boards of directors of government banks, after consultation with RBI and with the previous sanction of the government, to repay paid-up capital which is in excess of the wants of the bank; (3) the shareholders of a partially-privatised bank, by a special resolution passed with a minimum of 75 per cent majority, to cancel capital against its loss or repay excess capital. The reduction in capital under all the clauses should not exceed 75 per cent of the paid-up capital as on the date of the ordinance.

Newspaper reports indicate that on the issuance of the ordinance, banks have rushed to RBI with their proposals for capital restructuring. As I understand the problem, there is no urgency, except in the case of PNB, necessitating *ad hoc* decision without a thorough study of the various issues involved. The four major factors which need consideration are (1) the nature of the loss to be wiped out, (2) the special features of the capital to be reduced, (3) the purpose for which capital is to be reduced, and (4) the competence of the bank management to achieve the objective of capital reduction in harmony with achieving the other objectives of the bank. Let us examine the four factors in some detail.

During the two years ending March 1994, the loss incurring nationalised banks incurred a total loss of Rs 8,767 crore. Of this, provisions claimed Rs 7,712 crore and operational losses Rs 1,055 crore. The bank managements, which did not follow even a modicum of norms for income recognition

and provisioning cannot be expected to follow the newly introduced norms also in their true spirit. Their mindset remaining the same, such managements jump to the other extreme of making excessive provisions. Citing a top executive of a bank with accumulated losses of over Rs 1,400 crore, a writer has mentioned the case of a dispute of about Rs 30 crore in an account in the bank. The bank has provided Rs 50 crore in the account despite auditors making it clear that no provision was needed. Further, apart from excessive provision in individual accounts, the bank has created a contingency provisioning fund by way of surplus provisioning. Such a policy has been adopted, we are told, to take care of future losses in advance and also to increase future profits by write-back of provisions. Therefore, what the bank management has done is to nationalise future losses when the bank is expected to be in partial private ownership and privatise current profits when the bank is fully owned by the government — a case of privatisation of government profits and nationalisation of private losses. The RBI and the government have to take note of the above character of provision-related losses and the lack of commitment to professional values displayed by such managements. Apart from the excessive provisions, substantial part of the current legitimate provisions and operational losses resulting from non-recognition of income is expected to be written back either by conversion of non-performing loans into performing category needing no provision or by recovery from borrowers.

The government has recently established many debt recovery tribunals to facilitate prompt recovery of dues to banks. The suit-filed cases involving Rs 10 lakh and above with public sector banks liable to be transferred to the tribunals numbered 10,595 on August 1, 1993. Based on information on the amount involved in such cases with four nationalised banks, the total amount involved for all nationalised banks may be estimated at Rs 4,677 crore. As compared to profit-making banks, the loss-incurring banks have a higher proportion of suit-filed cases falling within the jurisdiction of the tribunals with better chances of recovery. It appears correct to say that many bigger borrowers have become wilful defaulters taking full advantage of weak bank managements. Wiping out the losses of banks by the government will significantly eliminate the necessity for recovery from borrowers and will hamper the emergence of strong professional managements in banks. The reasons which the RBI adduced against the Janata

government's Agricultural and Rural Debt Relief Scheme (the government paid Rs 2,158 crore against a claim of Rs 2,833 crore made by public sector banks) and the Narasimham committee's recommendation for establishing an Asset Reconstruction Fund to take over bad and doubtful debts are valid here also. The point I wish to make is that cancellation of capital against loss has to be done after a careful consideration of all the implications and not under hasty, half-backed schemes of partial privatisation.

Conceptually, the reduction in capital should be related to the irrecoverable loss out of the provisions. One way to arrive at the figure of write down of capital against loss is to restrict it to the loss written off by banks out of the gross NPAs as on March 31, 1993. The RBI should study the write off and recovery experience of banks with regard to NPAs as on March 31, 1993 and formulate guidelines for cancelling capital against loss rather than creating opportunities for administrative discretionary decisions. Rule-based decisions are required if professionalism is to be developed, both in the supervisory and supervised organisations.

The ordinance empowers the shareholders of partially-privatised banks, either with or without extinguishing or reducing liability on any of its paid-up shares, to cancel any paid-up capital which is lost, or is unrepresented by available assets; or pay off any paid-up share capital which is in excess of their requirements. The power may be exercised from time to time. The objective of the clause, it appears, is to reduce government shareholding in stages. The objective is laudable, but I have a doubt. As I understand, after share capital is raised from public, all shareholders, namely, government and private, have equal rights and obligations. Under such a situation, will it be possible to say, even with the consent of the government, that only government-owned capital is lost or unrepresented by available assets or in excess of the wants of the bank?

Before taking up the problem of repayment of capital, let us look into the special features of the government contribution to the capital of banks. At the time of contributing capital to banks, government asked the banks to invest the funds in special bonds so that the capital contribution does not entail immediate funds outflow. Initially, the bonds were perpetual non-tradable securities at 7.75 per cent interest. On subsequent occasions, 10 per cent tradable bonds redeemable in instalments were issued. On reducing the government capital, the funds invested in

the bonds will become delinked from the government contribution to bank capital. It will become bank's own funds invested in very low earning securities without justification. A solution to the problem is to convert the 'Recapitalisation Bonds' into tradable bonds at market rates of interest but redeemable in instalments. The resultant lower demand for government securities from banks for SLR purposes could be managed by slowing down the pace of reduction in SLR and widening of the market for government securities. A suggestion to meet the higher interest payments on the converted securities is given below.

The ordinance enables the profit-making banks to reduce government capital by repaying it. As the contribution to the capital was tied to its investment in low earning 'Recapitalisation Bonds', there is a strong case for linking repayment of capital also to the same bonds. Nevertheless, it was suggested in the earlier para that they should be delinked, largely to the advantage of weak banks. As the objective of capital repayment by strong banks is to increase earning per share so as to get a high premium per share while issuing shares to the public — in excess of its wants is only a legal fiction — the capital repayment should be at a premium. The premium for repayment of capital should be fixed as a percentage of premium on public issues.

From the foregoing analysis, an outline of an integrated scheme for the capital restructuring emerges. To sum up:

- (1) India needs a commercial banking system which is socially responsible and profitable. The experience of many banks in the country shows that poverty alleviation lending is not contradictory to profitability under strong, professional work culture.
- (2) In any scheme of capital restructuring of banks, the first requirement is to delink bank capital from the 'Recapitalisation Bonds' by converting them into marketable bonds at market rate of interest and eligible for SLR purposes, but repayable in instalments. The consequent reduced demand for government securities from banks may be managed by slowing the pace of reduction in the SLR ratio.
- (3) The repayment of government capital by banks should be at a premium fixed as a percentage of the premium to be charged while issuing shares to the public. The percentage should be uniform for all banks. This will partly compensate the government for the additional interest on converted bonds.
- (4) For partially-privatised banks, no cancellation of government capital is envisaged. This will reduce the scope for speculation in their shares.

(5) For weak banks with substantial losses, the primary requirement is to strengthen the management and work culture so as to ensure that they can become profitable and socially responsible banks in a competitive environment. They should strive hard to become profitable on current operations after meeting the current provisions.

(6) The write back of provisions relating to NPAs as on March 31, 1993 will be excluded while assessing a bank's turn around.

(7) The cancellation of government capital will be against the irrecoverable losses out of the gross NPAs as on March 31, 1993. Such cancellation will be done from time to time.

(8) The ploughback of the profits and the cancellation of capital against irrecoverable losses will substantially reduce the losses and increase the real capital of the banks. Only after a bank demonstrates its strength to manage the affairs of the bank profitably and with the social responsibility expected of it, it will be permitted to approach the capital market for equity capital.

(9) Under the above framework, it will not be possible for all banks to achieve the minimum capital adequacy ratio by March 1996. While there will not be a general extension of the date, the RBI will give exemption to individual banks for a specified period depending upon the position of each bank.

(10) For the interim period, extremely weak banks will be provided with Tier II capital support by government. Banks may also raise Tier II capital from the market.

There may be disagreement over the elements of the integrated policy frame outlined above, but the need for an integrated approach is beyond dispute. Even the finance minister underlined its need when he said, on the occasion of the centenary celebrations of Punjab National Bank, that privatisation of the economy should be based on rule-governed systems involving the laying down of objective and publicly-stated criteria and guidelines for the conduct of regulatory authorities. Formulation of an integrated policy for the nationalised banks, which are under his direct control, will add credibility to the finance minister's observations.

'Once Upon A Language'

Peggy Mohan

Literary Urdu is not adapted, in India, for modern discourse of a technical nature. So you choose: if it is emotional it will be in Urdu; if it is scientific it will be in Hindi; if it absolutely must be in common 'Hindustani', it will be trivial and depthless. You mustn't jump from branch to branch of this language tree. But intuition and fearlessness have a way of cutting through these man-made strictures.

SOMETIMES it takes nothing short of all your dreams coming true for those dreams' inner hollowness to come to light.

I was taken to see Alkazi's 'Three Greek Tragedies' (Hindustani adaptation: S M Mehdi; direction: E Alkazi) with the simple brief of finding and exposing what was 'wrong' with the language of the script. My companion confessed that she could never follow the language used in Alkazi's adaptations of European plays. This time they were calling it 'Hindustani'. I was to find a way through the jungle of terminology – Hindi/Urdu/Hindustani – and to psychoanalyse what Alkazi was up to this time.

But in less than five minutes I was utterly hooked by the script-writer's spell. The language was alive, and it glowed. It was not 'easy', nor was it meant to be. One could ride alongside Mehdi-Sahab's struggle as he tossed between the limitations of his audience and the minimum demands of a language which has to deal with complexity. And in the end he chooses to look on his audience as any elder in an educated Urdu-speaking family would look on its children: he decides that we will find our way, and that the words and phrases we might miss would at least stir a memory. We would feel 'at home' with him, drinking in the familiar but elusive language of 'adults'.

And what he means by 'Hindustani' is another bright surprise. There is no way he could have trivialised the depth in the original plays by rendering them in the 'Hindustani' of superficial domestic conversation or of Bombay films. The only languages before him with that amount of range and depth were literary Urdu and literary Hindi. Of these two, literary Urdu was the one that truly felt and breathed. But, as anyone writing a script today knows, literary Urdu is not adapted, in India, for modern discourse of a technical nature. So what normally happens is that you choose: if it is emotional it will be in Urdu; if it is scientific it will be in Hindi; if it absolutely must be in common 'Hindustani', it will be trivial and depthless. You mustn't 'jump' from branch to branch of this language tree.

But intuition and fearlessness have a way of cutting through these man-made strictures. The 'what if' of a younger, more timid writer materialises here as a healthy hybrid Hindustani that takes depth from both literary

Urdu and technical Hindi. And all of a sudden one sees it: 'yes!' Instantly one can recall the faces of all those thoughtful souls who really *do* live their lives in this kind of language. It's just that it could not be contrived: it had to come from the heart. Like his breathtaking phrases in Persianised Urdu which burst forth like 'alaaps' from a singer who knows he is way beyond his audience, but, who must run-swift-run-free in order to feel: it had to come from the heart.

But why, you ask, did he have to outstrip his audience especially when he *knows* the extent of our linguistic impoverishment? Well, the problem doesn't begin at script level. To refocus: why is *the director* so doggedly insistent on adapting abstruse Greek Tragedy, or any other 'approved' European genre, for that matter, into Hindi or Urdu? Why this morbid need to 'be Indian' about something so undeniably foreign? For, much of the mismatch that damns Alkazi's productions, with their awkward Nordic costumes and mouth-splitting names on a warm Brown language, is there because he insists on reliving the White Man's ready-made experience and thrusting it roughly at the Indian elite through the proxy mode of translation. He has always felt safe, with his White security blanket, safe enough to press serious script-writers into the less-than-worthy enterprise of 'dyeing' it to present to us as an Indian 'purdah', in shades of linguistic saffron and green.

I am not the only one to mount this attack on Alkazi. But earlier I used to wonder: how is he so invulnerable to this constant drone of criticism? Is he carved in granite? And there it was: granite. The ultimate male director's refuge, an overdose of masculine 'yang'. 'I must be strong and stick to my way because if I fall I will never get up again.' But it is *normal* for artists to fall, again and again, but we just know we have to get back up, shaken, humbled, *educated*, by these shocks. We *learn* because we allow negative experience to transform us. We grow and change *because* we are vulnerable.

If there is one nightmare which has the power to paralyse me with fright, it is of finding myself on a set, directing a script in an Indian language I feel unconfident in, wondering what the crew thinks of my presence in the production, too 'locked' to reach out and *lead*, seeking solace in mere

technological expertise. But the dream ends happily – I am dashed to pieces by my own crew and reborn as a director who can 'feel' the language of the script. Alkazi's rock-like façade has allowed him to *remain* the fully-formed foreigner who once came to India, and this, *this* is what has made him hold back and resist 'inflicting' his own human warmth on an 'Indian' production. Alkazi solved his nightmare by encasing it in an intimidating level of literary Urdu: intimidating both to the crew and the intended audience. But, of course, you cannot *create* in a medium you do not feel you 'own'. You can only exist on borrowed ideas, and manipulate outer form by remote control. But – you can never be said to 'fall'.

And what about the fakeness of an elite Indian audience who pretends and pretends to understand and enjoy what is 'ours' in a tiresome game of 'ghar-ghar', since French-watch-plays-in-French, and Chinese-watch-plays-in-Chinese, and English-watch-plays-in-English? It is ironic, but we are probably the only audience left on earth that struts into the hall in fancy non-western designer-clothes – sarees, shalvar-kameezes, khadi kurta-pajamas, pashmina shawls – and the only audience on earth that ends up feeling inadequate on account of our diffidence about our 'own' language. It was not Mehdi-Sahab's decision to stage 'Three Greek Tragedies' in Hindustani. His was only the artist's task of writing the very best possible script given the absurdity of the situation and the falsity of the audience that must be the patrons of his inspired work.

Falsity. Because I *know* I will have to hear the indignant whine that 'most of us actually understood everything'. And with this self-deception the downside within us will only go on. Because I *know* that if I 'froze' some of the phrases in the script and asked this audience to explain, I would get, at best, a glimpse of meaning shrouded in mist and uncertainty. I *know* they do not read novels in Urdu. I *know* they do not read newspapers in Hindi. Yes, there are many-many people all around us who *do*, but we have done our best to disempower them and render them invisible. Invisible and unconfident. There is no other way for us to make sure that all the goodies of globalisation come to us alone. And our penance for this selfishness and iconoclasm is that we will roam the earth half-blind to a beauty that only the 'invisible' among us can truly enjoy.

This is not just my imagination: I have heard that the young cast of actors had precisely *this* honest reaction when confronted at first with the script. But, amazingly, they were given the power to change anything 'too difficult' – provided it did not lose the meaning and rhythm of the original script. So these representatives of modern India 'lived with' the script as a flexible thing, and played around with it, only to fall under its spell in the end, as I

did. They decided to change nothing, because they understood, in the end, that any lesser script would fall far short of what the original version demanded, in terms of complexity, sophistication and beauty. And *this time* one was amazed to hear a cast one had heard before enunciating Urdu scripts as though they were awkward gymnastic exercises, *this time* dripping language in shades of love. The sense of alasp in the beautiful Urdu phrases came as much from the actors as from the script-writer.

Some ancient Buddhists have likened enlightenment to the cracking of a mirror, allowing man a glimpse of a truer reality behind it. For the same reason, the ancients were wary of perfection, because a perfection in just one tiny sector of reality could not

fail to show up the other workings every where else. My last review of an Alkazi effort was easier to write. The script-writer, then, was different. And the script, then, was bad, the language unliving. In 'Three Greek Tragedies' Mehdi-Sahab has removed that as a factor in my reckoning. And now the arrow of blame points straight back at me, and at the director, and at the rest of the audience, for the silly games we have been playing up to now.

And I am left here remembering one glimpse, long ago, of Mehdi-Sahab sitting in his timeless-looking room with his books, his eyes shining with the compelling clarity of innocence, and I wonder if the world in his language was not a better world, after all.

Domestic food shortages, therefore, reveal tensions have grown and are bound to grow further, initiatives in policy-making and determining the direction of the economy have passed into the hands of the owners of foreign capital and their global institutions. Investment flows and price movements have aimed at restructuring the economy in tune with a design for aggravating income disparities and opening up the Indian market for foreign capital, goods and services. Prices of specific commodity groups and fiscal concessions have been so adjusted as to increase the purchasing power of the elite segment of the population for the high priced goods and services. It has now been established that the percentage of the population below the poverty level has grown, the middle classes have been squeezed and those enjoying affluence, a very small number, have become more affluent.

Import of sugar and recently also of edible oils has suddenly been found to be a soft option by the government because of the burgeoning exchange reserves which it is unable or unwilling to use to step up investment and promote growth of the economy. With inflation touching higher and higher levels week after week and no sign of the budgetary deficit, especially the revenue deficit being brought under control, the budget of the union government to be presented in the middle of March is obviously posing severe dilemmas for the union finance minister. Manmohan Singh, in addition, has to reckon with crippling political-electoral constraints. He has been 'advancing false alibis for the failure to achieve macro-economic stabilisation and promote growth impulses in the economy. Rather than admit the inherent contradictions and infirmities of the so-called economic reform programme and the methods adopted by the government to implement it, he has sought to blame the 'slippages' in the performance' of the economy in the last three and a half years on exogenous factors. The large buffer stock of food grains and the build-up of the foreign exchange reserves may still be applauded by interested quarters to be a bright patch in an otherwise grim economic scenario. But the food stocks and the exchange reserves are not likely to be used as real assets for price stabilisation or for promoting growth and generating employment. The only way to price stability and economic growth is to enhance the rate of domestic saving and step up investment under a well-conceived order of priorities, economic and social. The rate of domestic saving has actually declined under the economic reforms regime. Despite the diversion of saving to the private corporate sector through the mechanism of stock exchanges and trading in shares and stocks, investment in the economy remains subdued.

The upshot of these conditions is a further shrinking of already small demand in the domestic market - small relative to the needs

NEW DELHI

Inflation: Finance Minister's Forgotten Promises

B M

Official policy is now guided by the notion that there is no way, at least for a long time to come, to pull the economy out of the mire of stagflation. It has, therefore, settled for keeping inflationary pressures within what may be just tolerable limits for the upper and middle classes, though the mass of the people are hit hard.

THE inflation rate showed a declining trend for a brief period after the launching of the market-oriented economic reforms in the middle of 1991. But it started climbing up again from as far back as the middle of 1993-94. Administered prices of several sensitive commodities, among them food grains and petroleum products, had to be raised under the new policy dispensation. Side by side, the fiscal deficit of the government had to be cut, which drastically scaled down investment in both the public and private sectors. There have, therefore, been fluctuations in the rate of inflation. But the general tendency has been for the rate to go up. The upward pressure on prices is now gaining momentum because the policy options of the government have become more and more circumscribed for economic as well as political reasons. This is indeed very disconcerting for the Congress party when the general election to the Lok Sabha is due little more than a year hence and is causing much disquiet among Congress supporters whose ranks are fast thinning as can be seen from the results of the state assembly elections.

Finance minister Manmohan Singh promised in the middle of 1994 that he would bring inflationary pressures under control within three months, well before the end of the year. This promise held good for hardly three months. Afterwards, he seems

to have become totally indifferent to the rise in the inflation rate. He has become a helpless spectator for the simple reason that the assumptions on which he was relying have turned out to be misplaced. Market forces obviously do not in general work in the interests of the consumers in underdeveloped economies, especially the mass of consumers with low incomes. Owners of capital, the producers and traders, however, find easy opportunities to enhance their profits under market-oriented policies. Manmohan Singh seems to have reconciled himself fatalistically to this position. Official policy is now guided by the notion that there is no way, at least for a long time to come, to pull the economy out of the mire of stagflation. It has, therefore, settled for keeping inflationary pressures within what may be just tolerable limits for the upper and middle classes, though the mass of the people may be hit very hard, even as the rate of economic growth remains sluggish.

The notion that fiscal concessions for the private corporate sector and the middle classes would give positive results and boost investment and growth too has turned out to be fanciful. The upshot of the market-oriented adjustment policies has been helpless dependence on massive inflows of foreign capital to provide investment funds and supply of goods to meet expectations of a thin top stratum of the population. This has been the experience of other developing

of the mass of the people. This is bound to discourage market-oriented investment, even in the private sector, by both Indian and foreign business interests. Side by side, public authority has lost the ability as well as willingness to mobilise resources for investment – either for education, health services and development of human resources, as loudly promised, financial or for augmenting supplies to satisfy essential consumption needs. Investment in energy, transport and intermediate goods to strengthen and enlarge the material infrastructure for growth too has been grossly neglected. It will be misplaced to expect that the budget for 1995-96 will reverse these trends. It is more likely to be inspired by gross political opportunism, especially so after the electoral setback for the ruling party and in view of the general elections to the Lok Sabha which are due to take place in early 1996, if they do not have to be advanced to sometime in 1995 itself. The budget will further expose the total poverty of leadership of the union government. There will be a side-stepping of all meaningful policy initiatives. Even those who glibly talk of a populist budget to win votes may find themselves disappointed. All that may be proposed is large disinvestment of the capital of public sector undertakings, while avoiding any cut in food and fertiliser subsidies.

While appropriate corrective measures will have to wait till a government enjoying the mandate of the people takes charge after the Lok Sabha elections, in the intervening period groups of vested interests, domestic and foreign, will manipulate policies and administrative action in their favour and against the needs of the people. The increasing pressure on the budget-makers for enlarging the scope of import-liberalisation, including for consumption articles, will have significant economic and social implications. There will be a further deepening of recessionary conditions for domestic industry exposed to foreign competition. The inability of the economic reformers to deliver the bonanza for the middle classes they promised when they embarked on the IMF/World Bank structural adjustment programme has become stark in the fourth year of its implementation. This presents tricky choices in the making of the budget for 1995-96. The economic reforms programme, it may be noted, was supposed to be completed in a period of three years, but it has yet to really take off. In the meantime, the government headed by Narasimha Rao has lost the political will as well as authority for meaningful policy-making.

The prime minister who has been thrown into the position of having to function virtually in a caretaker capacity is under contrary pressures from many quarters. The cabinet expansion which he finally resorted to has not improved his position. Even Rao's

protest, who for long avidly awaited the cabinet reshuffle, have not been able to find anything refreshing in it. It has been merely suggested that the cabinet expansion may hopefully enhance Rao's authority within the government and the faction-ridden ruling party. But this too may turn out to be a vain hope. That there was intense wrangling over the allocation of portfolios is a reflection of the state of affairs in the Congress party. Ministers, old and new, sought more influential or remunerative portfolios, while the prime minister found it necessary to

continue to retain direct charge of a large number of portfolios, among them defence and industry which certainly require full time attention and care. That Rao has kept the industry portfolio under his charge is really intriguing. The fissures in the Congress party at all levels have visibly sharpened after the cabinet expansion. That the ailing Dinesh Singh had to be retained as minister without portfolio was a pathetic admission of the constraints, political and personal, under which the prime minister is functioning.

AGA KHAN FOUNDATION

Requires a
PROGRAMME OFFICER
(Education)

Aga Khan Foundation, a non-denominational development agency based at Geneva, has programme interests in Health, Education and Rural Development. The Foundation in India currently supports programmes implemented by NGOs in Gujarat, Maharashtra, Andhra Pradesh, Rajasthan and Delhi. Its particular emphasis in Education are Early Childhood Development and School Improvement.

The *Programme Officer (Education)* is responsible for developing and appraising project proposals, including budgeting, monitoring, documenting, evaluating and networking with other international organisations, NGOs and Government. The person should possess: a) an advanced degree in Education/Social Sciences/Management; b) 3-5 years experience in education development work in an international agency/major NGO or academic/research institutions; c) excellent oral and writing skills in English; d) ability to work as a member of inter-disciplinary team; e) strong administrative and people skills; f) willingness to travel extensively in India.

The challenging position is Delhi-based and offers an attractive compensation package commensurate with professional skills and qualifications.

Applications with full curriculum vitae, contact telephone/fax numbers and names of two referees, should reach the **Chief Executive Officer, Aga Khan Foundation, Sarojini House, 6 Bhagwan Dass Road, New Delhi 110 001, within 10 days** of this advertisement. Applicants should be in a position to attend interviews in March 1995.

Aga Khan Foundation (Incorporated in Geneva, Switzerland)

Funding Higher Education in India

Jandhyala B G Tilak

While stressing continued subsidising of higher education, a recent seminar also favoured fee hike for modest cost recovery and corporate financing of educational institutions.

RECENTLY, the University Grants Commission (UGC) has brought out a Report of the Committee of Funding of Institutions of Higher Education. The committee was headed by Justice K Punnayya. The All India Council of Technical Education (AICTE) has also brought out a similar Report on Mobilisation of Additional Resources for Technical Education under the chairmanship of D Swaminadhan. Though these two reports came out independently of each other, as parallel reports, there are also several common arguments and suggestions on wider policy issues as well as specific procedural issues in these two reports. Though the main focus of the UGC report was on central universities and other institutions of higher education, its suggestions and recommendations are applicable to most higher education institutions in the country, including state universities. Besides, these two reports provide corrections to several general misimpressions about, say for example, on the levels of subsidisation and cost recovery in higher education in other countries, and thus contribute to informed policy-making in higher education in India. The UGC and the AICTE are also actively engaged with the implementation of the recommendations made in these respective reports. Having been brought out after the introduction of the new economic policies in the country, these two reports spell out the need for various new strategies in funding higher education, that have serious short, medium and long term implications. At this stage, it is generally felt that a discussion on these two reports would be very useful, providing valuable inputs into policy planning of higher education in the country, besides raising a public debate, on several issues raised in these reports. These two reports taken together, present an integrated approach to the problems of financing of higher education in India. With these in mind, the National Institute of Educational Planning and Administration has organised a two-day seminar on Funding of Higher Education in India on January 23-24 to discuss problems relating to financing of higher education in India, based on these two reports. More than a score of senior academics and heads of institutions (from several universities, and institutions of higher education like the Indian Institute of Technology and Indian Institute

of Management), policy planners from the Ministry of Human Resources Development, University Grants Commission, members of the two committees, and others participated in the seminar. During the one-and-a-half day seminar, several important issues were discussed intensively. The context of the discussions were the two committee reports but the discussions were not restricted to the reports. The issues covered include the role of the state, the role of the market or the private sector, principles and practice of grants by the UGC, extent and scope of cost recovery in higher education, particularly the role of fees, scholarships, loans, special taxes, etc., and generation of internal resources by institutions. The discussions also pondered on specific details. There was much consensus on many macro-level and micro-level issues, and there was also much divided opinion on several other major issues and specific procedural details and institutional arrangements.

SUBSIDISING HIGHER EDUCATION

The discussions proceeded on a familiar but a questionable premise of limited resource base. It was argued that the government does not have adequate funds, fiscal resources are restricted; and tax revenues are relatively inelastic, and hence public resources for higher education will be limited. As Atul Sharma stated, there is a fiscal crisis in India, with the tax system being highly inelastic to the needs of the economy. It is an irony that on the one hand, the government claims high economic growth during the last one or two years, and hopes to reach a higher rate of economic growth in the near future as an important outcome of adjustment policies, with increased levels of capital inflow from multinational companies and bilateral and multilateral organisations, increased levels of private investment, and high probability of availability of more resources with the government as a result of dis-investment in public sector undertakings. At the same time on the other hand, it is forecasted that the education sector, particularly higher education, will continue to be engulfed with the problems of severe degree of financial inadequacy. According to N C Mathur, even if 6 per cent of gross domestic product (GDP) is allocated to education as promised by the prime minister

in the past, higher education will face increasing financial crisis. Hence the need for mobilisation of additional non-governmental resources.

There was a consensus amongst the participants on the need for continuation of the dominant role of the state in funding higher education. As the two committees have strongly recommended, the state should consider it as a main responsibility to subsidise higher education, and make a firm commitment to fund higher education, including technical education. The subsidisation of higher education by the state was argued to be necessary on a variety of grounds. With globalisation and liberalisation of domestic economy, demand for skilled manpower will increase significantly. Currently only about 5 per cent of the relevant age group population is enrolled in higher education institutions in India, compared to above 70 per cent in US and Canada, more than 30 per cent in South Korea and several European countries, and more than 20 per cent in several developing countries such as Philippines and countries in Latin America, viz, Cuba, Costa Rica, Panama, Chile, Argentina, Bolivia, Peru, Uruguay, Venezuela, etc. With inadequate highly educated manpower, globalisation will not be meaningful and beneficial to the Indian economy. Secondly, it was strongly felt that for ensuring equity and social justice, public investment in higher education becomes very important. As D N Rao convincingly argued, higher education is the only instrument of social mobility in India and hence for upward mobility of the weaker sections of the society, it is necessary that state liberally subsidises higher education. Higher education is probably a better and more effective instrument of ensuring equity and social justice than many other direct measures. Besides, two theoretical arguments are also relevant here. Externalities, including inter-generational externalities, associated with education are substantial, even if all of them cannot be quantified. In case of higher education and technical education that are regarded as specialised human capital, the dynamic externalities will be particularly significant. Higher education adds to the stock of knowledge of the society. State subsidisation of education will be necessary to capture these externalities. Significant reduction in state subsidies will result in below social optimum investment in higher education. With imperfect information flow of the kind we have, the 'merit' argument also seems to be particularly relevant in India. Many could be ignorant of the multi-faceted benefits of higher education. Imperfect knowledge necessitates public investment in higher education.

Further, as S N Mishra argued, all societies in the past did fund accumulation of

knowledge. Higher education widens the horizons of knowledge and thus adds to the stock of intellectual knowledge of the society, which is very important. Besides, there are several important but not necessarily marketable disciplines of study (e.g., arts, humanities, social sciences, research, fundamental sciences, high technology, etc.) that need to be rather fully financed by the state. If state subsidisation does not favour such disciplines, there is a danger that these disciplines would perish, as market forces would not be interested in them. For the complete development of the individuals and societies, these areas of study are as important as other tradable areas, if not more. C S Jha suggested that many courses in higher education can be divided into three categories, viz., fully funded by the state, partially funded by the state, and self-financing courses. Such a classification can be attempted on the basis of the critical importance of a given area, its marketability, and the costs of education. From this it would be clear that besides arts, humanities and social sciences, several other vital areas of study need to be fully funded, several areas need to be partially but substantially funded and very few courses can be totally self-financed.

With respect to state financing of higher education, the UGC committee has recommended few important measures. The most important measure suggested refers to unit-cost formula based grants mechanism to the universities, according to which most of the state grants will be related to enrolments. The formula was welcomed by many as an important measure of significant improvement over the present *ad hoc* system of grants. Such a formula is hoped to be equitable and efficient as well. However, it was noted that the use of the formula requires detailed estimates of several important components of the costs of higher education in each institution. This may require, Amrik Singh observed, massive training of staff in the UGC, universities and other institutions of higher education. Besides, it is felt that it is not necessarily an efficiency promoting measure, as the enrolments do not indicate any level of efficiency of the system. Tapas Majumdar cautioned that it may induce the institutions to enrol more and more students, including less qualified ones, or it may induce the institutions to report fictitious inflated enrolment numbers in their reports. While the weaknesses of the formula were well noted, it was agreed that this would be an important and significant improvement over the present system. It is also necessary, according to Jha, to develop a set of specific parameters for measuring efficiency of the universities. After all, efficiency in the universities is different from efficiency in private sector industries. Many highlighted the need for evolving procedures and

guidelines for overall improvement in the system and these measures, if found reliable, could be linked to grants, so that the whole grants mechanism becomes efficiency-oriented. In this context, social audit of the university systems was also suggested.

The need for detailed and elaborate data base was strongly felt by many. It was noted that the statistical information system in the UGC (perhaps as well as in the central and state governments) and in the universities need large-scale improvement. Tapas Majumdar warned that without a strong, reliable and updated statistical information system, policy-making and planning in higher education becomes extremely fragile. It is a pity that though the UGC regulations link yearly grants to a university to the submission of financial details of the preceding year, these regulations were never strictly adhered to, resulting in a wide gap in the data base for several years in the recent past. It should be realised that the costs of mis- or inadequate information are high. In this context, many stressed the importance of making not only the government bodies and institutions, but also the students aware of the costs of education, the extent of subsidisation, and the present levels of cost recovery. The need for transparency at all levels is obvious. Transparency will improve the efficiency levels considerably. Detailed statistical information system should be able to help in accurately estimating the total costs of higher education, the components therein, the subsidy being provided to each student under various heads, etc. Such information is crucial in making sound policies regarding financing of higher education. V P Garg noted that this might require substantial changes in the format of the university budget statements.

COST RECOVERY IN HIGHER EDUCATION

While every one agreed on the need for continuation of the critical role of the state in funding of higher education, there seemed to be some consensus emerging on the need to raise more resources outside the government. Important resources in this regard include fees and loans. Tapas Majumdar argued that support for low fee structure in higher education was meagre. Fees have to be raised, essentially because, they have not been subject to systematic revision. They are not only not linked to inflation, but also they have been left unchanged for several decades in many universities. Secondly, it was reported that there was willingness to pay for higher education among a majority of the students. Referring to a study conducted at the Indian Institute of Technology at Madras, V S Raju observed that as many as 75 per cent of the students were ready to pay a fee of something like Rs 40,000 per year for education in IIT,

compared to the present level of less than Rs 1,000 per student, and that the remaining 25 per cent would also be ready to pay the same, if loans were made available. It was felt that this willingness on the part of the students and parents is not tapped enough by the educational institutions. Thirdly, it was also stated that high fee structure would improve internal efficiency of the system, by compelling students to demand high quality education, though this need not be necessarily true: if it were true, the capitation fee colleges should be offering very high quality education.

Further, the fees paid in higher education has no correspondence to the fees paid in school education. While students pay very high fees for primary education (particularly in private schools), there is no reason why they should not be asked to pay reasonably high fees for higher education. Amrik Singh suggested that the fee paid in the school for each student should be taken as the minimum level of fees to be charged for higher education. Though there seems to be much sense in such a proposal, it may be noted that only 5 per cent of primary school children go to fee-charging private schools. Even if one takes the actual students and not their proportion, there would still be large number of students whose education would have to be fully subsidised. Another desirable suggestion in this regard refers to some form of differential fee system in higher education according to the undergraduate, postgraduate and research levels of higher education. An increase in fees also corrects the regressive nature of financing of higher education out of general tax revenues, a substantial part of which comes in the form of indirect taxes paid by the poor. As Atul Sharma observed, since higher education is still a privilege of the rich there is no justification in financing higher education out of general tax revenues.

The UGC committee has suggested that all costs of universities and institutions of higher education should be broken into three components: academic (teaching and research) costs, academic support costs (libraries and laboratories), and student welfare costs (hostels, etc.). The committee opines that attempts should be made to recover near full costs with respect to student welfare costs, substantial proportion of academic support costs, and *reasonable* or *meaningful* proportion of academic costs from the students. Yet, few have argued for a steep increase in the fees, and a high cost recovery ratio from the students. Both, the AICTE committee and the UGC committee, have pleaded for raising the cost recovery rate to about 20-25 per cent of recurring costs, and that this level should be reached gradually. The UGC committee suggests that the cost recovery rate should reach 15 per cent in five years, and 25 per cent in a

span of 10 years. Amrik Singh found this feasible, as quite a few cases have shown that increase in fee rates do not attract any serious resistance from the students and parents. This can be done by hiking fee of selected items (e.g., examination fee, educational development fee, laboratory fee, library fee, computer fee, and occasionally tuition fees), and of selected groups of students (e.g., the new comers). Such a modest cost recovery ratio (20-25 per cent) is desirable compared to 50-100 per cent cost recovery from the students, since the former does not substantially affect the access of the weaker sections to higher education. Jandhyala Tilak argued against high cost recovery rates as it would further tilt higher education in favour of the rich.

Strong arguments were also made in favour of modest cost recovery rates based on international evidence. As the UGC committee documented, even in so-called market economies, students bear only a small fraction of costs of higher education: nil in Germany, less than 5 per cent in France, less than 10 per cent in Japan, and less than 15 per cent in US (in mid-1980s). In fact, as Dinesh Mohan pointed out, introduction of fees and raise in fee in higher education were not a global trend. These are confined to a very few countries (like US under president Reagan and Britain under prime minister Thatcher). In fact, if the present levels of cost recovery in higher education in India are about 15 per cent, as Jandhyala Tilak and a few others claim, the present levels in India should be treated as higher than in many European and developed countries. But if the fee contributions form only negligible (1-2 per cent) proportion of costs in central universities, as reported by J L Azad, there is a case for increasing the fees in these institutions. Further, Tilak commented that the actual incidence of fees and other costs of higher education in other countries is much less than what the estimates on cost recovery indicate, as there exist effective student aid mechanisms, supported by the state. For example, the incidence of fees on home students in the UK is practically nil. Dinesh Mohan also referred to the historical evidence that couple of decades ago higher education was provided free in many developed countries; and this contributed to the economic growth of developed countries. Instead of comparing the current Indian situation with contemporary situation in other countries, valid comparisons should be between present conditions in India with conditions prevailing 20-50 years ago, if not earlier, in developed countries. A historical reading of social factors is disastrous. Dinesh Mohan argued that if lessons are to be drawn from the history of developed countries, it is simple: provide free higher education to everyone and also provide liberally direct subsidies like scholarships and other types

of financial assistance to cover students' direct and even opportunity costs. In this context the inter-sectoral relationships between several layers of education also need to be taken into account. It was argued that fees in higher education has an adverse effect on the demand for not only higher education, but also on demand for secondary and even primary education, as secondary and primary education is mainly demanded not to secure employment (as school education does not offer any employment opportunities), but to seek entry into higher education later.

Along with increase in fees, the participants also argued for elaborate and well designed scholarship and loan schemes. It is indeed surprising that the AICTE committee and the UGC committee have only recommended very limited free and concessional studentships for the weaker sections (5-10 per cent of the total number of students). Majumdar agreed that these proposals might require upward revision, based upon actual number of students in higher education belonging to weaker sections of the society. The need for strengthening the scholarship scheme was also stressed. A case of well designed scholarships and freeships was emphasised, as fee is inherently regressive in nature and effect, and to counter this effect, a very efficient scholarship system is needed. There is no second opinion about it. Jandhyala Tilak further observed that since fee is at the entry point into higher education, and scholarships are received by the students during (and sometimes even after) studies that too with no certainty, the restrictive effect of fees has to be taken into consideration, while designing the scholarship schemes.

Many participants were highly favourable to student loan programmes as an effective mechanism of financing higher education and of safeguarding the interest of the weaker sections. But the over-enthusiastic optimism in favour of student loan programmes has been questioned by some on the basis of international evidence and Indian experience. It was noted that loan programmes requires an efficient capital market. Besides, it requires huge investment in the short and medium terms and hence it cannot be a short-to-medium term solution to the problem of finances (the AICTE committee suggested a capital base of Rs 3,000 crore to set up Educational Development Bank of India for floating soft loans); and even in the long run it might not be a strong solution to the problem of funding higher education, as loan recovery rates are depressingly low even in industrialised societies. As a recent World Bank study on Higher Education reported, average loan recovery ratio (including default and administrative costs) ranges between 2 per cent in Brazil and 67 per cent in Sweden and Barbados. According

to Tilak's calculations only 5.9 per cent of the total loan amounts could be recovered between 1963-64 and 1987-88 in India.

The principle of selective subsidisation, i.e., targeting the subsidies to the weaker sections, came under attack from economists like D N Rao, who favoured universal subsidisation instead, since targeting of subsidies has often proved to be problematic and inefficient, contributing to the accentuation of inequities and injustice in the society. Dinesh Mohan argued that the present system of scholarships for poor is inherently inequitable: as the poor should be meritorious to receive scholarships and stay in higher education, while no such conditions exist for the rich.

There was also repeated reference to brain drain and the extent of enormous loss of national resources involved therein. The loss includes not only investment loss, but also loss of skills. While investment loss can be checked through some measures of cost recovery like lump sum payment at the time of emigration, or tax on brain drain, and other measures, it would be difficult to recover loss of talent or skill. Dinesh Mohan regards the bias in enrolment distribution in favour of the upper income classes as the principal factor responsible for the whole problem of brain drain.

NON-GOVERNMENT FINANCES

Both the UGC and the AICTE committees have recommended several measures to augment resources by institutions from corporate sector. Important measures include allowing the institutions to keep the internally generated resources with themselves to be used for the development of the institution.

and liberal tax concessions to the donors. The former proposal is to encourage the institutions to generate on their own resources from non-governmental sector, and later one to encourage the donors to make contributions to higher education institutions. The committees have also proposed matching grants and other incentives to the institutions to match the internal generation of resources, as an additional incentive. These proposals were widely welcomed by the participants of the seminar. However, while some expressed much optimism, some were not so optimistic. V S Raju argued that the industrial sector was ready to make huge investments in higher education and research and development, but the higher education sector was not ready for the same. By offering tailor-made programmes, the institutions of higher education can generate substantial amount of resources from industrial sector. N C Mathur also saw an existence of such a scope, and suggested that generation of resources from industrial sector should start with Regional Engineering Colleges to produce demonstration effect on other institutions. On the other hand, some argued that given the past experience on the interests of the corporate sector in research and development activities, despite protection accorded to them by the government, one should not be highly optimistic about these proposals. Bashiruddin Ahmed also noted that there are several self-financing courses that can be started to generate sizeable resources. At the same time, the dangers in relying too much on such courses should be taken note of. Institutions may end up with emphasising self-financing courses, and ignore other vital areas. The links between profit seeking industrial sector and non-profit making higher education sector need to be forged with caution and utmost care.

There are some institutions that do generate a very high level of resources from non-governmental sector. Amarlal Kalro mentioned that 70 per cent of the resources at the Indian Institute of Management, Ahmedabad were internally generated through fees and other contributions. It was also noted that this was possible by being highly selective and elitist. While such elite institutions are necessary for development and to maintain excellence, and that such elite institutions should not be subject to common denominators, such levels of resource generation might not be possible and should not be attempted in higher education in general. Dinesh Mohan argued that while resources can be generated from industrial sector by organising skill upgradation courses, and requiring industries to make a one time contribution to the institution concerned for employing a graduate of that institution (similar to

jump sum payroll tax), it is necessary to note that higher education is not just for factory-based employment. It is for the development of individuals, for social development, social transformation, and it is for its own sake. The approach to financing of higher education has to take this into account. Rao cautioned that the predominance of management-based approach to the problems of financing higher education was not desirable. Under the present euphoria in favour of markets, there is a danger to miss the distinction between goods like higher education and goods like soaps and cars, and this will be proved costly in the long run. P Thakur also warned that too much reliance on market-oriented measures will be counter-productive as there are chances of educational institutions becoming mainly money-raising institutions.

There is a familiar argument that many higher education institutions are inefficient. Raja Raman remarked that these institutions were providing poor quality education, imparting no skills, and serve at best the screening and labelling functions for the benefit of the labour market, and hence, do not deserve more funds. But Dinesh Mohan responded that these higher education institutions were inefficient as the public investments made in these institutions are so inadequate that these institutions could not provide anything better. Inefficiency is rather the outcome of low investments made in education, and inefficiency should not be treated as a reason for low levels of public investment in higher education institutions. C S Jha stated that high quality education costs high; it requires higher level of investments, and the state that stresses on high quality and excellence should invest accordingly a good amount of resources in education.

The scope for more efficient utilisation of resources in higher education institutions was also dwelt upon by many. Bashiruddin Ahmed and Anand Sarup felt that much of the incidence of the financial crunch could be avoided by avoiding mismanagement in the utilisation of existing resources. Substantial savings could be effected by better management practices in the utilisation of the given resources. The UGC committee has suggested a normative pattern of spending resources on various activities: 60-65 per cent on teaching and research, 10-12 per cent on academic administration, and 20-25 per cent on auxiliary services, other departments, etc. Expenditure on non-essential activities should be reduced substantially.

There were several suggestions regarding augmentation of resources in higher education. Some proposals refer to special taxes, or earmarked taxes and education cess on industries. While many favoured

such taxes, theory of public finance does not favour earmarked taxes since the theory does not link issues of raising resources with issues of utilising resources. Besides, such taxes restrict the degrees of freedom of resource planners.

Many agreed that choices are indeed limited: the government has to finance higher education substantially; it cannot reduce its role. What is needed is the need for educating the government, politicians, policy-makers and planners. As Raja Raman argued, the rationale for state financing of higher education need to be made explicitly clear, showing how social benefits from higher education percolate down. Informed policy choices can be made only by properly educating the policy-makers. But there are also valid compulsions to attempt at raising resources from non-governmental sources. Hence the search for an optimum mix of government and non-government finances for higher education, and many participants strongly felt that this mix should be rather severely skewed in favour of government finances for obvious reasons.

To summarise, a few important policy suggestions emerged loudly and clearly from the seminar. They are: (1) The state cannot abandon its responsibility of funding higher education, and shift it to market forces. The state should continue to play a dominant role in financing higher education in India. (2) There is need to improve the mechanism of UGC/ government grants to universities and institutions of higher education. Grants mechanism based on unit cost formula is a minimum needed reform in this direction. This requires estimation of costs of education in great detail. (3) Efforts can be made to raise resources from non-governmental sources to supplement governmental resources, without affecting equity and efficiency in education. (4) One important measure in this regard is a modest and gradual increase in fees to cover about 20-25 per cent of the recurring costs of higher education, along with introduction of a well designed scholarship and student loan programmes. (5) Another important measure refers to generation of resources through voluntary donations, and other contributions from corporate sector, through tax incentives on one side, and incentives in use of these funds by the institutions on the other side. (6) A basic need of the whole system is a strong, reliable and up-to-date statistical information system in the UGC, AICTE, central and state governments and higher education institutions. (7) All aspects of financing of higher education – grants, costs, fees, cost recovery, scholarships, other direct and indirect subsidies, generation of other internal resources, etc., – should be completely transparent.

Rebellion, Repression and Reform

Carol Upadhyia

The army crackdown on the Zapatista rebellion in the Chiapas and its subsequent withdrawal in the face of popular opposition underscore the instability and weakness of the government of president Zedillo who is forced to walk a tightrope, balancing his promises of electoral, party, judicial and economic reforms against his obligations to the old guard of the PRI who saw him into power.

ON February 9, president Ernesto Zedillo of Mexico, after two months of attempted conciliation and apparently frustrated by accusations of his government's weakness, ordered a crackdown on the rebel Zapatista National Liberation Army (EZLN) in the southern state of Chiapas. The army was ordered to move into the region to execute arrest warrants for five Zapatista leaders, including the charismatic 'Subcomandante Marcos'. The justification given for this move was the discovery of stashes of weapons, ammunition and explosives during raids, which according to the government indicate that the rebels were preparing for armed attacks in Chiapas and elsewhere. The government also seized documents which revealed the identity and 'bourgeois origins' of the rebel leader, who has always used a nom-de-guerre and appeared in public wearing a mask. (Zedillo's 'revelation' is nothing new, since Marcos himself has said in interviews that he comes from an upper-middle class, non-Indian background in Mexico City.) The government alleged that several other leaders were linked to urban terrorist groups of the 1970s, and on this basis the president claimed that the group's leadership and goals are "neither populist [nor] indigenous". These accusations were meant to strike at the core of the movement, which represents the struggle of the indigenous Mayan Indians for political, economic and cultural rights.

In the first army action in a year, government troops drove deep into rebel territory, reaching the guerrillas' best-known jungle stronghold of Guadalupe Tepeyac and easily consolidating control over a dozen Chiapas villages and towns because they encountered no resistance. But in spite of sending in 2,500 troops, 33 aircraft, 30 tanks and 32 armoured vehicles, the army was unable to capture Subcomandante Marcos; one of the five rebel leaders was held and the capture of another was claimed but not confirmed. The Zapatistas appear to have staged a strategic retreat: the army found several Chiapas towns all but

abandoned, and rebels were seen marching in columns into the jungle-covered mountains to the north. In response to the action, Marcos pledged to wage a long drawn-out guerrilla war if the clampdown continued.

The deployment of troops was a very unpopular move, as several large demonstrations in Mexico City showed. Perhaps in response to this opposition, on February 14 the president, calling the operation a 'success', did another about-face by cancelling the search for the rebel leaders, offering amnesty, and proposing to reopen negotiations. In an apparent attempt to appease the rebels, the governor of Chiapas, Eduardo Robledo Rincon, who the rebels say was elected fraudulently, stepped down. In another conciliatory move, the government allowed a human rights inspector into Chiapas, who confirmed that the army used torture on those arrested, seven in all, to extract 'confessions'. Besides the resignation of the governor, the rebels are demanding the withdrawal of troops before talks can begin.

Zedillo's turn-around may have also had something to do with the results of the elections held on February 13, which went against the ruling PRI (the Institutional Revolutionary Party). The National Action Party (PAN), a centre-right party, won the governorship of the state of Jalisco and control of the state legislature and a majority of city halls. The vote was hailed by some as the fulfilment of Zedillo's promise of fair elections and greater democracy in Mexico. (These elections followed two days of rioting by protestors in the state of Tabasco against the allegedly fraudulent election there of the PRI governor Madrazo.) The election was the first since the devaluation of the peso in December and the subsequent economic crisis which forced the country to appeal for international aid. The vote, according to analysts, could be the first in a series of PAN victories; given the disarray in the PRI, the party has a chance to win control of Mexico's lower house of Congress in the 1997 federal election. Three other states, all PAN

strongholds, have gubernatorial elections this year.

Mexico is hardly a democracy in practice. A strong centralised bureaucracy has ruled the country since the revolution, and the PRI has retained its hold on power for 66 years by using fraud, force and public funds. The Zapatista rebellion, among other things, represents pressure for democratic reform, and the rebels have received wide support from other Mexicans on this count. The feudal attitudes of ruling party bosses in states like Chiapas have contributed to the discontent. Having treated Mexico as its private fief for years, the PRI is beginning to see the results when elections are conducted fairly. The rebellion in Chiapas may actually have achieved one of its aims, by pushing Mexico towards a more democratic system.

But the Zapatista rebellion is not only about democratic reform; to some observers, it represents the indignation of Mexico's poor over free market reforms. Even supporters of reform acknowledge that the new economic policies have increased the already-huge disparities of wealth. Sixteen per cent of Mexico's population is officially classified as living in 'extreme poverty', and another 28 per cent as 'poor'; most of the poor live in the countryside, and the state of Chiapas is the poorest of all. Economic reforms have not benefited the peasantry; for one thing, the government phased out agricultural subsidies, including those on maize, the staple diet of the peasants. In January 1994 at the start of the rebellion (which significantly was launched on the same day that NAFTA took effect), Comandante Marcos denounced NAFTA as a 'death sentence' for Mexico's Indians. The Indians are also opposed to the recent land reforms, aimed at freeing up the market for land, because the original land reforms to distribute land to the peasants never really took effect there. Many Indians have lost their lands to cattle barons with connections to the PRI, and many remain landless in a region of large estates. Salinas' anti-poverty agency, Solidarity, was created to channel resources to the poor agrarian regions, but the money received has not offset low prices for coffee, the state's main commercial crop, and the withdrawal of agricultural subsidies. Rather disingenuously, president Zedillo blamed the recent economic 'meltdown' on the Zapatistas, whose activities are supposed to have put pressure on the peso and the stockmarket. But he has yet to recognise that the same economic (and political?) policies that led to the meltdown also have created the social conditions that sparked the movement.

Even more than a peasant rebellion about agrarian issues, the movement represents a pan-Mayan cultural uprising that

encompasses the rest of Mesoamerica as well – their demand is for Indian political and cultural autonomy. Half of the population of Chiapas is Mayan in language, culture and ethnicity, and the Mayan Indians have suffered centuries of oppression and discrimination in Mexico and other countries at the hands of the non-Indian population and the state. The Indians in Guatemala have been engaged in political struggle for indigenous rights; it should come as no surprise that the Chiapan Indians are beginning to awaken.

These recent events, on top of the economic disaster (which significantly followed the

installation of a cabinet full of foreign-educated, market-oriented economists – Zedillo himself has a PhD in economics from Yale), underscore the instability and weakness of the present government. Zedillo is forced to walk a tightrope, balancing his promises for electoral, party, judicial, and economic reforms against his obligations to the old guard of the PRI – the 'dinosaurs' – who saw him into power. It remains to be seen whether, from such a weak position, Zedillo can proceed with the promised democratisation of Mexico and also address the legitimate demands of the Zapatistas without again resorting to the use of force.

to work on their lands, particularly during peak agricultural periods. With workers losing wages and factories losing production, this could not be a sustainable solution to the problem of meeting the labour requirements of agriculture.

The leasing-out solution emerged in the village. As a result the village has four specialised agricultural households, producing crops for sale and operating an average of 37.25 mu each. But more than 80 per cent of the village land is to be devoted to production for village consumption. This land cannot be leased out for commercial farming. Finally, the availability of outside labour was also limited.

A VASS was set up providing mechanised agricultural services to the farmers. The VASS is itself owned by the village collective, as are all the other enterprises (electrical fan, enamel-insulated wire and silk thread factories and a fishery unit) in the village. The VASS was set up with indivisible equipment acquired from the old commune. Initially the VASS only provided agricultural supervision and operated equipment that could not be used by household farms. But over time the functions of the VASS increased to cover a wide range of agricultural operations. These vary from land preparation, water management, farm input provision, plant protection, field drainage, rice nursery and fertiliser application to harvesting and transplanting. Due to lack of adequate and reliable machinery, rice transplanting and harvesting have both remained problems.

The VASS in order to keep its full-time workers occupied during the slack agricultural periods has taken up contracts for related construction works. The VASS carried out the construction and maintenance of the irrigation system and roads. At other times the VASS workers are taken up in the village-owned factories or provide transportation services.

With the uniformity of crops grown in the village, the VASS in effect carries out most of the agricultural work in the village. There is now no question of a lag in extension, as the trained workers of the VASS themselves carry out all the operations, supplemented by the labour of women and the elderly.

Land on which consumption crops are to be grown are distributed to households on the basis of the number of its adult members. But from the earlier situation of family members performing all the labour, the growth of VASS functions has led to the village collective itself (in the form of the VASS which it owns) providing most of the agricultural labour required. The village collective, through its Village Agriculture Development Fund (VADF) as it is, already undertakes all the investment in agriculture. The further growth of

Emerging Alternatives in China

DN

The self-proclaimed collective of Nanjie village and the virtual collective of Weinan fall into the category of common property systems. They are property and so involve the exclusion of non-owners from their benefits. They are different from the old communes in that their external relations are those of the capitalist markets within which they exist, while their economic relation to the state is basically one of delivering some amount of grain.

PROBLEMS in maintaining agricultural, particularly foodgrain, production and neglect of essential investment in agricultural infrastructure, along with problems of environmental degradation are well known features of present-day China. With the dismantling of the communes and the introduction of household distribution of land there are obvious problems in mechanising agriculture. One way out of this situation is through the emergence of a lease market for land. Some households would lease out land and become effectively dispossessed labourers; while there would be a centralisation of production on larger farms. This is the classic process whereby rich peasants and capitalist farmers emerge. To foster such a development there have been changes in the agrarian law to make it possible for long-term leasing of land.

The dismantling of the communes not only broke up the production units in agriculture, it also ended the social security and welfare systems, shattering the 'iron rice bowl'. Shortfalls in the provision of health and education services and their availability to the rural and urban poor have been reported.

In the context of capitalist market developments it is necessary to note the emergence of alternatives to the above processes, alternatives which seem to provide a better deal for the producers.

A study of Weinan Village in Wu County of Jiangsu Province (south-east China) points out that in order to resolve problems of mechanisation and modernisation of agriculture, a Village Agricultural Service Station (VASS) has come into existence. (This account of Weinan Village is based on Jun Zhou's Master's thesis, 'The Agricultural Service in Small-Farming Systems: A Study of Wu County, Jiangsu Province, PRC', at the Asian Institute of Technology, Bangkok.)

With the household responsibility system there emerged an acute problem of labour shortage. Households economised on the use of labour by substituting purchased inputs for those that had to be collected manually. In the place of the earlier practice of dredging up river sludge for fertiliser (which used to be done over half a year) farmers substituted chemical fertilisers. As a result the ratio between organic and inorganic fertiliser decreased dramatically from 1:2.9 in 1980 to 1:16.2 in 1992. China's famous stress on organic fertilisers was wiped out by the household farming system. Herbicides were used to reduce labour requirement for weeding.

While women and the elderly are the main farmers, most others are part-time farmers, also working on the enterprises owned by the village. These enterprises arranged 'agricultural vacations' to enable the workers

industry, by increasing the demand for labour, would push up the opportunity cost of the women who are now left as the sole whole-time family farm workers. The VASS would then take over all the agricultural operations of the village, leaving a household system only in name.

Already agriculture provides just about 1 per cent of the income of the village. Meant basically for subsistence (besides the sales to the state) agriculture is in effect a supplement to the income earned from the village-owned factories and other enterprises. (The situation bears a resemblance at one level to what one finds in plantations in many parts of the world, where unused lands are given to the families of workers to produce crops to supplement their wages. Of course, there is big difference in that the plantations are not owned by the workers, while the village enterprises in this case are owned by the village collective.) Since land is held on the basis of the number of members in a family, there is an equity in the distribution of foodgrains, at least part of which is not related to the income that the workers earn from the village enterprises. Further, with the basic foodgrains being produced in the village and not being subject to distribution through the market, the spectre of inflation that looms over China is partly kept at bay in Weinan village.

If Weinan village has virtually abandoned the household system of farming, Nanjie village in Linying County, Henan Province, has formally abolished the household responsibility system. A report in the *Far Eastern Economic Review* (November 17, 1994, on which the following is based) says that Nanjie abandoned the household responsibility system after working it for six years. In this period agricultural production fell by 50 per cent. After reverting to communal production village agriculture has reached record levels. But in common with Weinan, in Nanjie too agriculture accounts for barely 1 per cent of village income. The rest comes from various village enterprises. The village collectively owns 26 enterprises.

Migrant workers in Nanjie are three times the village's own population. But their wage rates are reported to be even higher than those paid to Nanjie's own workers. As at Weinan, workers get a portion of their income in kind, so that inflation is not a problem.

What Nanjie workers get as direct entitlements does not depend just on the number of members in a family (as it does in Weinan where grain entitlements depend on land allotments). Evaluations of social factors, such as cleanliness, studiousness of children, political participation, etc, are the basis for the distribution of welfare benefits. Overall, the village has the highest per capita income in China.

While it is necessary to investigate the relations between the ruling elite (of the party and managers) of the village-owned enterprises, on the face of it, there is not that separation of the workers from the means of production characteristic of capitalism. These are not the state enterprises that were supposed to be owned by the whole people. They are owned by a group of people, defined as the (adult) residents of a village. The enterprises are private property. Not individual property, which anyway is not even characteristic of capitalism with its joint-stock companies. But this is not a simple corporate village entity, since there is not a disjunction between workers and owners. If (and it is a big if) there is not a separation of party officials and managers as a stratum from the workers, then there would not be a stratum or class of non-working owners (as the owners of a joint-stock company are).

But there are some non-owning workers. This is revealed in the distinction between local and 'guest' workers. Certainly, the guest workers would have no part in the political affairs of the village. Or, in determining the use of surpluses for accumulation, etc. In economic terms, there are differences in the benefits the two categories get. At Nanjie, those of the village get superior housing. Free education right through to college is unlikely to be availed of by guest workers. In Weinan, village workers get a portion of income in the form of grain from land; while guest workers would have to buy all of their requirements

on the market. Thus, even if guest workers are better treated than, say, Palestinian guest workers in the Israeli kibbutz, there are still important differences in the benefits that accrue to workers who are owners, and workers who are not also owners. (This is reminiscent of the situation in Munda villages in Jharkhand, where residents who are not of the original land-clearing clan, do not have the same status as the descendants of the original clan of village founders. Given that Chinese villages are largely clan-based, is this more than a mere similarity?)

The self-proclaimed collective of Nanjie village or the virtual collective of Weinan fall into the category of common property systems. They are property, and so involved the exclusion of non-owners from their benefits. They are different from the old communes, in that their external relations are those of the capitalist markets within which they exist, while economic relation to the state is basically one of delivering some amount of grain (amounting to far less than 1 per cent of village income). But while operating within a capitalist market and thus having to abide by its laws of competition, accumulation, etc, can ownership of enterprises by its workers enable the workers to secure a better position in the market, internalise at least some externalities and introduce more equitable methods in the internal distribution of income within the enterprise? A deeper study of the newly emerging trends in China would enable one to answer these questions

New Book from	MD	Publishers of the Humanities, Natural & Social Sciences
INTEGRATED HORTICULTURE DEVELOPMENT IN EASTERN HIMALAYAS		
By A N Sarkar		
This book attempts to address to various concerns, developmental options and priorities in horticulture and allied fields through an integrated and holistic approach, in the Eastern Himalayas. A systematic, scientific and planned development in the region has been analysed. The book is of great interest of academicians, planners, development workers, entrepreneurs and industrialists in the region, country and abroad.		
1994, xiii, 292p, 32 plates, col ill, bibliography, index; 25x19cm ISBN 81-85880-40-9		Rs 800.00

New Trends in Sociology in France

M Coornaert

Sociology in France is undergoing great changes; the rejection of older paradigms has thrown up new problems. Some aspects of this transformation and its causes are outlined in this note.

FOR a sociologist engaged in research for many years, it is obvious that sociology in France has undergone and is currently undergoing great changes. There are many signs of this transformation: the use of new words, the renewal of concepts (one example among many others: the concept of 'identity' was practically unheard of when I first began as a sociologist). Themes have changed and so has the overall problematic, in urban sociology, for instance, the 'after 1968' period was strongly marked by the theme of 'segregation', which in turn gave birth to a new way of tackling social relations in the city. The emergence of this concept was both linked to the objective reality – the inflow of foreign workers, immigration, etc – and to a specific ideological and political background, that of 'urban struggle', in which many urban sociologists were engaged. Yet, nowadays, the issue of 'segregation' is receding (even though some of us continue to study its effects and characteristics) while the theme of 'exclusion' is taking over. At the same time, the overall problematic is being displaced from 'city' to 'society' at large, the city being the place where exclusion is being 'created', generating problems exceeding by far the limits of the city – unemployment, training, education, and so on. Nowadays, those among us who call themselves urban sociologists are speaking of the 'dual society', 'first' and 'second' rate economy, and social justice. As a consequence, the very framework of the analysis had to be reconsidered while sociologists were compelled to reconsider the criteria and categories they had been using in the past. Such changes, directly related to the changes that are taking place in society, put rather squarely the famous question asked by Max Weber about the relation between science and politics. But we shall return to this later on.

There are many other examples of these changes. If, for Durkheim, 'anomie' was one of the central themes of reflection of the past few years, a vast quantity of studies and investigations have flourished around the issue of the 'social link', an expression hardly ever used as such in the past. Judging by the essays dedicated to the issue, the

so-called academic social studies are clearly coupled with philosophical interrogations: thus the question, "Why is the social link missing in our society?" (an issue which is generally tackled by the negative) is coupled with another, "How do we recreate the social link?", with a clear tendency to focus on the elements of social, political and economic life that may help recreate the missing social link. As a consequence, whole series of studies have been conducted around these 'solidarity links' in their various forms, and how these links are being weaved in, one is compelled to resort to concepts so far unheard of, such as 'solidarity economy', for example, in order to study the new services implemented in neighbourhoods, new industrial relations between companies and salaried workers, new forms of employment and management, etc. Also, full attention has been given to these 'networks' and the links they create between individuals, neighbourhoods, and different categories of social 'actors'. Whole series of investigations are being conducted on these networks, exploring transportation, communication, and daily life in a common perspective.

At the same time, in a different area of social life, the surveys conducted around companies and labour practices and organisation have equally developed alongside the changes affecting the very links that exist between workers and companies. In France, the company was traditionally considered by labour sociologists as the place where the 'working class' was being 'created'. Yet a recent survey revealed that employees no longer identify solely with their company; it is no longer the only place where they can achieve a goal. In fact they tend to seek resources elsewhere, in other areas of social life. Some sociologists consider this phenomenon a small revolution. Equally, and due to various factors, labour relations in large companies have undergone profound changes – hierarchy and authority are no longer what they used to be, and they require new terms and conditions. Participation, equal relations, shifts in responsibilities, and broader information are elements that sociologists must take into account and study, elements which, in

turn, sociologists contribute to developing through debate and communication.

Here again, the bond existing between science and society stands at the very heart of an extremely vivid and tense debate – the standpoint of the scientist vis-à-vis his field of investigation, his observees and interviewees. The relation between society and sociology is a major issue – depending on the importance given to the topic, the idea of sociology as a science takes on its full meaning. Broadly speaking, it can be said that 'academic' sociology was born of a need for objectivity and veracity, which required that the observer or scientist remain an 'outsider'. In fact, one among the most eminent founding fathers of sociology, Durkheim, and others with him, were haunted by the idea of breaking off with metaphysics and philosophy and, in this particular case, with social philosophy which was, in their view, unable to meet the requirements of sociology as a science. Their ideal model was the natural sciences, or, to be more precise, experimental sciences. Thus the celebrated formula, taken up in turn by many, although with a variety of interpretations: "Treat social facts as objects". We also know the debate initiated by such authors as Dilthey, regarding the difference between the human sciences and natural sciences, and the path opened by Weber, among others, leading to comprehensive sociology and the necessity to take into account the characteristics proper to social phenomena and all human actors involved in the social process. Over a long period of time, and even during the 1960s, French sociologists, regardless of the various trends, considered the 'outsider's standpoint' as the only guarantee of truly scientific work.

Yet, in practice, things were not so simple, even less so when the very conditions of investigation urged the investigators to break the golden rule. Indeed, for a great many reasons, a large number of investigators, be they 'public' (that is government-paid) or private, were caught up in the machinery of contractual research. While French society was experiencing profound changes, some governmental bodies were putting up ambitious research programmes (under the guidance of some illustrious investigators), that provided the financial means necessary to carry out fieldwork otherwise impossible. Although supposedly free to carry out their surveys as they pleased, investigators were often imposed deadlines, as well as other more subtle constraints – concerning the questionnaires and the themes proposed – which, one way or the other, contributed to subordinate scientific investigation to what is currently

known as the 'social requirements', often to the prejudice of rigorous methodology and to the benefit of approximate, albeit 'interesting', results. It is my view that much of the disarray expressed by French sociologists is due to the fact that investigations are being conducted in a somewhat hectic manner, without any capacity for accumulation (which is not the case in biology or physics, for instance, where investigations are carefully conducted over long periods of time), without proof and counter-proof procedures (cross-examination). Under such circumstances, even well-conducted investigations have suffered from non-renewal of contracts, non reproducibility, lack of comparative work among different studies conducted around the same theme. Often when one reads the reports one feels the lack of distance (despite the preliminary declarations and other preambles of the author), and even those who claim to be rigorous are not altogether free from ideological sidings, especially when the quarrel, not only between the different schools, but also between the various political trends – between 'marxists' and 'American empiricists', or the 'conservatives' in the proper meaning of the word – was, to say the least, scathing.

In any case, over the past 10 years it has become commonplace to hear that French sociology is undergoing a crisis, the absence of a duly established and universal paradigm, the need for a general Theory (with a capital T), except for some who consider their own sociology as the only one (in this respect, Pierre Bourdieu is a past master), the lack of universal references. It is true that there are many different trends, each with its own set of references and own sources but the word 'crisis' seems a bit strong.

As I have said earlier, sociology has undergone profound changes, changes that are directly related to the transformation of society itself. Yet it is precisely the very task of sociology to understand what is going on in society. Many sociologists were shocked to discover the gap existing between the conclusions they had reached and social reality at large or in its minutest manifestations. Was it not a sign that their postulates, assumptions, and methods of investigation had to be revised? And indeed, such discrepancy was often interpreted as a sign that old patterns, concepts and methods of investigation were outdated. Here again I shall give an example, even if it may seem incidental. Grossly speaking, due to the fact that many sociologists were Marxists, society was considered a compound of classes, and often a two-class compound. Yet, even if it is generally assumed that social classes are a compound

rather than a simple reality, it became more and more difficult to speak of a 'working-class', especially when the surveyed population was one of white collars, when middle-classes labelled as such seemed to be in the making, when new categories were emerging, working together as a combined and dynamic movement (I won't use here the word *group*) endowed with a consistent approach and a desire for collective action, as was the case of the executives which were the subject of a well known book. Thus there was a need to revise categories and nomenclature, and for the two-fold task carried out over the past few years – that of definition and reflection. The need for reflection has brought together specialists from different areas of the social field – statisticians, economists, sociologists.

It is interesting to note here that, of late, collaboration between these different areas has been reinforced, and that the encounter between such areas as history, philosophy and sociology is much more common than it used to be, the existing frontiers appearing all too rigid and somewhat artificial when the surveys compel the surveyors to take the multidimensional aspects of social life into account. Thus, for example, the whole nomenclature of professional categories is being currently revised for a better and more accurate grasp of the different types of population, taking into account criteria – job, income, place and type of dwelling – far more complex than in the past. In the first place, the new criteria allow a better and more accurate study of the social compound of the different units – cities, neighbourhoods, companies, etc. They also offer a broader explanation of the present and the possible future behaviour of actors. One is often tempted to speak of 'social recomposition', taking into account the changes brought about by the organised types.

This work of reflection has led some sociologists – namely, those anxious to preserve methodological theory – to reconsider their modes of classification: some of them question how categories come into being and the consequences of this or that formalisation; others question about alternatives, taxonomy or not, for instance, others question the relevance of the notion of category in sociology by comparing the various, more or less vague, terminologies in use, and by dismantling the various forces involved in the construction of the said categories. It could be said, in other words, by quoting Durkheim once more, but from a critical point of view this time: If we are to treat social facts as objects, we ought to keep in mind that the categories we refer to are compounds.

Since I cannot give here a thorough account of the various trends that offset the very idea of a united sociology in France, I shall restrict myself to one issue only which, in my view, is a major one: the concept of action in relation to the knowledge sociologists have of actors, their impact, and their practice. This is a major issue in my view because it is directly related to the idea of society itself – as a whole, as a system, or even as a multiple compound whole coherence, complementarity, and also compatibility and incompatibility are to be taken into account. It is a major issue also because it compels sociologists to reconsider the bonds between macro- and micro-sociology, one of the cornerstones of traditional sociology. Regarding this issue, today's sociologists speak of an epistemological break-up. What do they mean by that? Why such a break-up? What are its causes?

Of course, categories are already being reconsidered, alongside an attempt to grasp the different social units in the process of daily life (and in France, more and more emphasis is put on daily life, with many different trends, from Henry Lefebvre to Maffesoli, as well as all the essays concerning the "history of daily life" – a certain way of using and weaving history into the social canvas, which is a rather innovative approach and which, in itself, constitutes a break-up. But more profoundly, it is the very pattern of sociology – either new or traditional – that are being put into question. In other words, it is critical sociology. For many sociologists, working individually or in teams, and despite their differences, the theoretical formulation of these 'socio-logical trends' has a common postulate (or belief): society forms a whole, a unit which works according to mechanisms in which individuals are involved in an external causality, excluding the subject as capable of any creative activity or intention. Durkheim, his associates and followers, say it is strictly 'social', thus avoiding all references of the past: humanism, psychologism and idealism. By viewing society as a whole, some sociologists say that we have created an ontology, that of 'holism'. But it is not altogether free from a certain 'voluntarism', a desire to consolidate a society on the move, because of industrialisation and the new forms of capitalism – which in itself constitutes a sort of break-up with the ambition of a pure science. On the other hand, this vision of society as a universal mechanism is insufficient, because even Durkheim, when investigating the reasons for suicide, is tempted to resort to anthropology in order to identify the contingencies linked to the emergence of such phenomena, and to personal experience.²

As to critical sociology, either that of the 1960s and 1970s onwards – strongly influenced by Marxism – or that of Pierre Bourdieu, it proceeds according to a certain ontology, an ontology of the subconscious replacing that of the 'great whole'. This sociological trend equally considers that individuals are overwhelmed by society, reduced by it to the role of simple agents.

This trend stems from a principle of external causality which acts as a driving force for the functioning and development of society. The social forces lead social beings within a global project, that of domination, in order to achieve stability and ensure reproduction. Even when Bourdieu insists on practice, it is a practice which finds its expression in a *habitus* embodied by socialised agents caught in the illusion of free-will. For Bourdieu, this illusion of free-will is, to a certain extent, the necessary mechanism ensuring the well-being of collective life. Since French sociology is still bearing the hallmark of Bourdieu's work, it is only natural that his concepts and methods should come under attack from more recent innovations. If one readily admits the part of truth in his work, one also discovers its limitations. When, for example, parents organise the curriculum of their children, drawing a career plan for them, they rarely realise that the choices they make freely are in fact pre-determined and linked with their own history and social position. However, today, this kind of assessment can only result in a neutralisation of sociology, denying it any capacity for explanation. But above all, it seems to me impossible to consider only he who is endowed with the title of sociologist as capable of revealing the unknown; moreover, when common agents are deprived of the capacity to grasp the processes in which they are involved – not to say that he denies them the least part of personal intention – by what miracle an agent, who is not a sociologist, could agree with the vision presented by the sociologist. We are here in the presence of a conjuring trick which deserves an epistemological reflexion of which no hint has been provided so far by Bourdieu, the great decipherer.

Another major trend in France, also crossed by sundry currents, is that of Crozier and Boudon, among others, who have always rejected the holistic vision of society. To them, individuals are, on the contrary, rational actors, capable of strategy, of rational choices. Inspired by Anglo-Saxon utilitarianism, the file-leaders of this trend, have attempted to demonstrate, both through fieldwork and through major organisations, how the 'actors' played their own game according to interests they were either trying to optimise or maximise, or to combine according to specific goals.³ Yet, here again, even if one is referring to supposedly rational individuals – a

socialised version of the *homo economicus* – the critics have attempted to demonstrate that the system as a totalising unit outweighs the individualistic concept. Here again, through reflexion and research, one is compelled to moderate the structures of rationality taken as models.

These hasty incursions lead me on to the present propositions, which tend to offset the postulates and certainties of the past. These propositions, I believe, can be summarised thus: first, "There is a plurality of social worlds" or "There is not one society but a variety of societies". The second point which is felt as an urging obligation as well as an intimate conviction, is: "There aren't only socialised (or mechanised) agents. There are subjects, practical and endowed with intentions that are not only the expression of interest. Society begins where individuals cohabit – for good or bad, as enemies or friends, where actors attempt to co-ordinate their lives, their paths alongside other individuals. Individuals are actors, as says Boltovskoi, who do not live in just one sphere, but in various worlds."

These propositions create a whole range of new tasks and new possibilities for sociologists. Among these new possibilities one in particular is interesting by exploring action, interaction and connection between the various actors (partly the heritage of Grossman and of American interactionists), it is, or it would be possible to bridge the impossible gap, that exists with traditional theories, between micro- and macro-sociology.

By discarding the idea of a single society and taking into account the plurality of worlds while returning to the sources of the logic of action, it becomes possible to understand how co-ordination was impossible and becomes possible. Two authors, Boltovskoi and Thevenot, take the example of a conflict in a company. In this case, each one of the actors starts acting according to his or her own rationale. The worker who has made a mistake will incriminate the bad quality of the material, or the lack of proper instructions; the foreman will blame the inefficiency of workers; the inspector will blame the organisation and the working conditions; the employer will put forward economic reasons detrimental to working rates. As each one of them pursues his or her own rationale, a settlement seems more and more out of hand while the whole affair is turning into a dialogue of the deaf. It is the task of the sociologist who has failed to solve the conflict to discover the reasons of each one of the actors and the rationale of the world in which he or she operates. And, first and foremost, if the sociologist wants to understand, he must consider each one of the participants as a serious person, aware of what he or she is doing and capable

of expressing and voicing his or her demands. The first and foremost condition, as I said, is therefore to get rid of one's prejudices according to which agents are not actors but objects deprived of conscience, and to accept plurality.

Also, one should not merely focus on the demands of the agents, but grasp the agents in their encounter with objects – here the gas tank. But this would take too long to develop, even if it seems to me essential to point out the introduction of objects as elements of proof and counter-proof in the confrontation of actors.

In fact, it is a new definition of the word *action* which is at stake here. In this particular case, it is clear that French sociologists have sought inspiration in the Anglo-Saxon model. The traditional analysis has attempted to tackle action in a new manner – step by step, sequence by sequence. To follow the procedure in such a manner is not easy, it raises a number of methodological problems, but these in turn contribute to the renewal of the procedure.

To study society by understanding how actors make decisions, how they move along, hesitate, demand, ... leads to other consequences – to accept that a 'diffuse' rationality may exist. Some authors work in this direction, attempting to describe the emotional elements that summon up the actors (of Boudon in his latest studies).

Last, a vital issue is at stake, that of language, with its complex dimensions of understanding and communication. In the wake of Max Weber's ever increasing influence, many a sociologist has returned to Weber's work, sometimes with diverging views, and have contributed in turn develop comprehensive sociology in France. As to communication, the influence of Habermas, especially in his last essay, 'The Act of Communication', is very sensible. Here again, it is a certain conception of sociology which is at stake.

These trends have rekindled the interest in social practice, a social practice which has been both neglected in the past and considered as fundamental by some young and not so young specialists, that of argumentation: in order to reach an agreement, one must argue; to advocate one's demands one must argue. Thus, seeking inspiration in areas outside sociology – linguistics, philosophy – some sociologists have published essays around the theme of action in which they put the emphasis on the different aspects of argumentation. Aware of the criticism surrounding their work – accused of neglecting their own speciality, of not giving enough attention to social facts, of concentrating solely on theoretical problems – they argue that without thorough investigation the everyday work of the sociologist will lack the necessary basis.

In order to follow the process step by step, and to consider actors as allowed a certain margin of action, not so much in the classical sense of the term freedom, but as the expression of uncertainty, compels one to reconsider the observer-observee relation. Instead of superbly taking the outsider's position, the observer is compelled to adopt a method of investigation which does not avoid the encounter with the observee. Touraine had already implemented a 'participating sociology'. Even if the latter has undergone setbacks and sidings through a misinterpretation of the two categories of partners, it has nonetheless showed the way out of a certain outdated and conventional approach – that of objectivity-exteriority – linked to the very concept of causality in society matters. Once improved, the method allows one to sharpen both the terms of the encounter and the elements as wagers of veracity. In this respect, in a recent essay F. Puket puts forward the idea of likelihood in order to qualify the relationship that exists between situation, utterance and interpretation. At the same time, he puts the emphasis on the fact that the method is the wager of the theory, and that a theory without a method will end up in the pantheon of pure ideas. And in turn a method without a theory is meaningless: one may proceed to a great number of factual analyses, yet one will end up with 'clouds', clouds that will never go beyond a certain level of comprehension if the theory is not there to underline them, and force the searcher to put his or her conclusions to the test.

The link between theory and method has always been a headache, even for the most illustrious of sociologists. In fact, break-ups and sidings often interfere with complex reasoning, sophisticated method and interpretation usually based on reliable data. In this respect, Berthelot has undertaken a very interesting task in order to grasp the links existing between paradigms, theoretical constructions and conclusions, bringing forward the evidence of how, in order to cover up a flaw, such or such author has operated a kind of 'camouflage', by using either tools or concepts that are exterior to the issue in question.

These considerations lead me on to one point which seems to me quite remarkable: as more and more sociologists reject a holistic view of sociology, they become increasingly aware of the links that exist between macro- and micro-sociology, of the continuity that exists between them, even if the latter is sprinkled here and there with voids and flaws. They have come to accept the social actor no longer as a dummy, but as a human being capable of common sense, reasoning and feeling. These sociologists increasingly feel the need to turn themselves towards new approaches, other than those offered by strictly conventional sociology. In today's

sociology, one currently resorts to philosophy, history, and human sciences in general, but also to technical analysis. By opening up to novelty, sociologists have ceased to intellectually confine themselves to their own country. It is amazing to see the number of foreign references – American, German, English – to which they resort. Equally, to tackle the world of labour, justice (a theme much in favour nowadays), state, and social justice, French sociologists have stopped referring to French sociology, to turn to sociology in general.

Is there a crisis? Without any doubt if one is attached to one general theory on society when there isn't any, and because of the absence of universal paradigms. But the task is gigantic, multiple, dynamic, because changes are constant, and changes are the most difficult thing to tackle, in particular for those among sociologists who believe that there can be no society without stability. A huge task that breaks up with the models and habits of the past by the emergence of a reflexion that goes beyond the limits in which scientist-sociologists would like to confine sociology, by implementing new approaches so far unheard of.

At the very heart of society lies action, but for sociologists who are willing to take part in the debate about the reasons for action and not about its causes, action is not the simple result of social mechanisms, nor is it deprived of meaning. Action, either

individual or collective – and at one point or the other both come into accord – cannot really be explained nor understood if one refuses to admit that it conveys a meaning. Action leads up to problems that exceed by far 'scientific' sociology, on questions of justice, ethics, responsibility – concepts that have been dug up and reconsidered as inherent and essential to society. Society is not – as many searchers of the new generation have become aware – an object, and those who envision it as such are sure to fall short of their goals, because, in other words, they refer to something which is not society.

Notes

- 1 One example of the changes occurring in the identification of social units is that of the family. Naturally, the term keeps its traditional meaning, but nowadays it includes other types of organisation and relation. With the extension of divorce, with the emergence of single-parent families, of relations so far unheard of between various members of split-up families, it has become necessary to revise the pattern of these units, their behaviour as well as their consequences for social organisation as a whole, dwelling, work, family income, legal problems, etc.
- 2 Equally, in a recent debate, Bourdieu admitted that each individual is endowed with a margin of freedom, albeit narrow, that makes struggle, refusal of injustice, etc. possible.
- 3 Here the influence of the theories of games and systems appears clearly.

STRUCTURE AND ADMINISTRATION OF SALES TAXATION IN INDIA

– An Economic Analysis –
(1995-Second Edition)

by

Mahesh C. Purohit

Professor

National Institute of Public Finance and Policy, New Delhi - 110 067

Price Rs. 450.00 ★ US \$ 60.00 ★ Hard Cover ★ Pages XII + 303

★ ISBN No. 81-85930-01-5

Contents: Introduction; Fiscal role; Economic effects; Structure of sales taxes: Rate structure, exemptions, taxation of inputs, surcharge and additional sales tax, works contract and leases. Empirical estimates of incidence of sales taxes. Rationalising sales tax structure: Weaknesses of the existing structure, short and medium term reforms, an approach towards State-VAT. Inter-State coordination in sales taxes; Administrative organisation: Operation of the tax including evasion and enforcement; Management Information System; Summary and Policy imperatives.

Another valuable treatise from the same author on:

**Principles and Practices of Value Added Tax
Lessons for Developing Countries (1993)**

Price Rs. 250.00 ★ – U.S. \$ 30 ★ Pp 226-ISBN No 81-85930-00-7 – ★ Hard Cover

Madras: Not Benighted?

A R Venkatachalapathy

The National Movement in Tamil Nadu, 1905-1914: Agitational Politics and State Coercion by N Rajendran; Oxford University Press, Madras, 1994; Rs 275 (hb).

At last we have a coherent account of events in the swadeshi movement in Tamil Nadu. Based largely on relatively untapped colonial documents in the Tamil Nadu Archives, Madras, N Rajendran narrates in considerable detail the extent and outcome of the early nationalist movement in the Tamil-speaking areas of Madras presidency. Much in the manner of Philip Barrow and Lucy Lacuna (*pace* Bernard Cohn's *Anthropology and History: The State of Play*), Rajendran sets forth to fill in a major territorial gap in nationalist historiography. This, as we shall see below, explains both the strengths and weaknesses of the book under review.

The study is set out in seven short chapters. The first two, on early challenges to British rule in Tamil Nadu and economic conditions during the period of study, are the weakest, especially in terms of analysis and drawing interconnections. These prefatory chapters lead to the more substantive part of the study. Chapters 3 and 4 trace the rise of extremism and the spread of the swadeshi movement in Tamil Nadu. To stress his point, Rajendran takes up the vigorous nationalist activity in Tirunelveli district as a case study (chapter 5). In the final two chapters, he fixes the responsibility for the failure of the swadeshi movement at colonialism's door, and attributes the rise of revolutionary terrorism to its repression.

The book seems to be consciously set as a response to the Cambridge school, especially David Washbrook's rather abrasive comment that "between 1895 and 1916, scarcely a single anti-British dog barked on the streets [of Madras]".¹ But in his zeal to impute too much to the swadeshi movement in Tamil Nadu, Rajendran overstates his case and often slips into nationalist hagiography.

Rajendran prefaces his account with the assertion that he is only reacting to the conventional characterisation of Madras as being a 'benighted province' and then concludes, after 160 pages of minutiae and empirical detail, that "Tamil Nadu in the years 1905-1914 emerges from our study squarely within the mainstream of Indian nationalist history" (p 160). This may explain his liberal use of empty nationalist rhetoric like "the quest for political freedom" (p 120), "courage, integrity and intelligence" and "a sense of intense patriotism" (p 85). It is doubtful if this is the way to put mind back into history! In any case

this does little to explain or understand concrete historical processes. The book is written as though Bipan Chandra and Sumit Sarkar did not exist, not to speak of the subaltern critique of Indian nationalism and its historiography. Nor does Rajendran even consider the not insubstantial Tamil scholarship on this question.²

It would appear that the positivist manner in which the study has been structured precludes the raising of any probing questions. But for a brief foray into certain aspects of mobilisation (pp 49-57), no questions regarding the social base, programme or ideology of the movement and its protagonists are posed. Even the shifts within the movement, between moments of moderatism, extremism, and revolutionary terrorism (which often tended to overlap with several shades of grey - for instance, G Subramania Iyer's extremism was more ambivalent than Rajendran would have us believe), have to be sought out by the discerning reader. The moderates get a raw deal, their role getting only cavalier treatment. Surely, K R Guruswamy Iyer, M Gopalakrishna Iyer, Maheshakumar Sarma, not to speak of V Krishnaswamy Iyer and V S Srinivasa Sastri, deserved something better.

Further, Rajendran seems often to overstate his fitting-into-the-nationalist-mainstream thesis. The swadeshi movement, at least in Tamil Nadu, was certainly not that widespread and tended to concentrate in a few pockets, especially Tirunelveli district and, to a certain extent, Madras city. Rajendran seems to conveniently bypass this by writing an extended study of the movement in Tirunelveli, calling it a 'case study' (chapter 5). Clearly it was not just a case, but for all practical purposes, the very movement itself. Likewise, the prevalence of nationalist songs (pp 53-54) is seen to be an indicator of the creative power and strength of the movement, but no more than four poets other than the famed Subramania Bharati are named. This too actually masks the fact that A Shanmugam Pillai and Kandaswamy Kavirayar wrote no more than one swadeshi song each. Similarly, in the last chapter, while Rajendran waxes eloquent that the "anti-colonial struggle in the south became growingly [sic] clandestine and conspiratorial, with arising accent placed on individual acts of terrorism", all that actually happened was one solitary instance of the murder of a district collector! As

Bharati himself was to remark later, "The terrorist movement in the Madras presidency was still-born".³ Rajendran valiantly tries to piece together minutiae from confidential colonial records to paint a larger-than-life picture of the swadeshi movement in Tamil Nadu. Unfortunately, it did not possess the kind of intellectual resources, mobilisation and spread as found in Bengal. It made only a marginal impact on the later course of the movement in Tamil Nadu, unlike in Bengal where it was to make a deep (and creative) impression on subsequent generations.

This lands Rajendran in a difficult spot, having to explain the abject failure of the movement whose magnitude he has inflated. Colonial repression offers a convenient panacea to all his troubles. Intelligence-gathering mechanisms; strategies to inculcate government employees and Indian sepoys against the multiplying 'virus' of nationalism; the persecution and exemplary chastisement of extremist leaders; action against the press - all these are supposed to explain away the ultimate break-up of the movement (p 164). The picture of the colonial state that Rajendran paints is nothing less than panopticon of the Foucaultian variety! The "ever-vigilant police machinery" (p 158) of which Rajendran speaks so much needed 25 years to take note of a swadeshi pamphlet and proscribe it.⁴ At best it contained a few scores of dithering, and not exactly well-trained, policemen. As for prosecutions, less than a dozen extremists were tried and imprisoned for sedition. Only one journalist was imprisoned and another bound over on an undertaking. Only two periodicals were banned and less than a dozen publications proscribed. If this meagre colonial harvest of Tamil swadeshi scalps explain the failure of the movement, it speaks eloquently for the strength and magnitude of the movement.

Moreover, Rajendran appears to have taken colonial intelligence reports rather more seriously than even the colonial masters. He would do well to remember the pithy comment by one official regarding frequent reports from policemen concerning prevalent rumours and discussions in trains and other public places about impending large-scale insurgency: "They have to earn their keep." But such is his fascination for colonial 'confidential' records that even for his account of the Surat split, he prefers *Secret Police Abstracts* to contemporary observations by V O Chidambaram Pillai and Bharati. Similarly, his table on the passenger traffic carried by the Swadeshi Steam Navigation Company could have been more elaborate and illuminating, (by tracing, for instance, the weekly movements of ships) had he

cared to step out of government archives.

No doubt, it is a worthwhile project laying bare the fallacies of the Cambridge school. But I would daresay it would involve more of theoretical combat and less of grubbing at the archives. Ultimately, Rajendran's considerable skill and labour in culling data from colonial records would have proved much more useful if he had desisted from unconsciously succumbing to the nationalist myth of a uniform and homogeneous process of a monolithic nation-in-the-making. More than any other part of the Indian subcontinent, it is Tamil Nadu which has exposed the many chinks in the nationalist armour, in terms of region, language and caste. A study of nationalism in terms of these contestations could have yielded new insights. But, unfortunately, even when such opportunities crop up during the course of his narrative, Rajendran prefers to miss them. Therefore he is able to see the emergence of the Justice Party as only paving the way for "polemics to enter the discussion of Tamil Nadu's nationalist traditions, and obscure the past" (p 1).

Given this premise, Rajendran constructs a linear narrative that silences ambivalent and contestatory responses. For instance, he attributes the aloofness of Nadars (a numerically preponderant upwardly mobile caste, previously downtrodden) in the movement

in Tirunelveli to the district collector's attempt to stir up caste antagonisms (p 114), while the reality was far from being that simple. In fact, when one Sankaralinga Nadar, despite having regularly attended swadeshi lectures, expressed his misgiving, "If you get swaraj, you will ask us to do menial things", VO Chidambaram Pillai could only mumble an ambivalent answer.³ (Later in his life, VOC was to distance himself from the Congress and identify himself with the non-brahmin movement.)

Another line that Rajendran could have pursued is the relative absence of communal tension in the swadeshi movement in Tamil Nadu. Apart from the material basis for such amity, an analysis of the language employed by the swadeshi leaders could also have been attempted. The relative absence of Hindu religious idiom in the discourse of VOC and other non-brahmin leaders are useful leads in this regard. Recent studies indicate that Tamil Muslims were more comfortable with a Tamil identity rather than with a Hindu-Indian one.⁴ If such issues had been kept in mind, the result would have been a more analytical work shedding light on many contemporary concerns.

To conclude, Rajendran's work is meticulously researched and documented, but ultimately, only flatters to deceive. An analytical history of the early nationalist movement

in Tamil Nadu still awaits its historian, but it cannot be gainsaid that she would find Rajendran's book useful.

The book could have done with some more editing and proof-reading. (While the title refers to the years 1905-1914, the narrative stops in 1912!) An index would have been useful.

SAGE PUBLICATIONS

METHODS FOR DEVELOPMENT WORK AND RESEARCH

A Guide for Practitioners
BRITHA MIKKELSEN

This book is an indispensable, down-to-earth, richly illustrated guide to a variety of quantitative and qualitative methods for research and practice in development settings. Providing practical examples, techniques and tools for different types of studies, Britha Mikkelsen examines in detail both the concept of participation and ethical considerations in field work, and stresses methodological pluralism and dialogue in development planning. She supports her exposition with illuminating case studies, quotations and graphics.

The major part of the book is devoted to new rapid and participatory methods, viewing them as an important adjustment of or complement to other long-established qualitative and quantitative field study methods.

Labour, Law, Liberalisation

Radha D'Souza

Labour Law, Work and Development: Essays in Honour of P G Krishnan
edited by Debi S Saini; Westvill Publishing House, New Delhi, 1995; pp 221,
Rs 295.

THE sociology of law is a nascent subject in this country. When a subject is new, any effort to advance the subject is a positive contribution. Labour law, work and development is a vast subject encompassing many disciplines, such as law, sociology, economics and management. Since the putting into place of the new economic policies, labour has once again become a subject of acrimonious debate. While the proponents of the new economic policies would simply like to wish away the fact that there was a labour aspect involved in the whole process of liberalisation and globalisation, the opponents of the policies have, focused on the human costs of liberalisation forcefully enough to cause discomfort to the proponents. Be that as it may, labour has once again become a subject of debate. The book under review reflects this dichotomy and divergence of views.

It is interesting that the very structure of the book should embody such a divergence. Section 1 deals with the socio-legal issues related to labour power as such, both organised (Saini) and unorganised (Baxi). The second section is a more descriptive account of how the law and the constitution have worked for some of the most marginalised sections of our society such as bonded labour, agricultural labour and migrant labour. The two sections, comprising of five essays each, hang together as the underlying focus in both is the worker as a human being – a human being in the vortex of a gigantic legal machinery. The focus is on the way the legal machinery tramples on the individual worker qua human being.

Any understanding of social issues proceeds on certain epistemological premises, stated or unstated. Historical determinism has been an important tool of analysis in social discourse, but this smacks of a certain 'inevitability' in the course of events. However, historical determinism has been a most effective tool in describing the complexities and inter-relatedness of phenomena. Such an analysis deals with things as they 'actually are' rather than things as they ought to be. A normative discourse, however, is concerned not only with what things 'ought to be' but leads invariably to prescriptions on policies and actions. This may seem idealistic and impractical. Law more than any other subject can be said to possess a natural affiliation to a normative discourse and a pull towards prescriptions for action and improvement. Baxi's essay on unorganised workers provides important

insights into the workings of law as an instrument of 'unorganising' the workers. According to him, law "disorganises" labour due to the historical need for "primitive accumulation through agrestic serfdom, carceral exploitation of capital". Having understood the sociology of labour law in these terms, Baxi shifts the terms of discourse when he advocates law as an instrument of "production of politics" rather than allowing it remain "politics of production"; such a change according to him must be through the active utilisation of law as an instrument of change. If law is an instrument of the dominant class, can it be expected to 'empower' the 'disempowered'? This is a basic contradiction rooted in epistemology. If Baxi's essay raises the issue, the issue itself requires a more thorough examination.

Saini puts on a scientific footing what is already known to all those who are familiar with labour adjudication forums and how they work for the workers. That what is commonly known is established by proper research methodology is an important contribution, as it elevates what was hitherto 'subjective' knowledge to a more 'objective' plane. Saini confines himself to the lower forums for dispute settlement such as the conciliation machinery and the labour and industrial courts. His special focus on termination cases – how most of them are espoused by the workers individually; how they end up in monetary settlements; how this itself is an important means of weakening collective bargaining strength; the use of courts to disempower collective strength – is an important contribution in understanding how legal processes work at the grass roots. The Supreme Court itself has played an important role in bringing about this state of affairs. For example, in numerous termination cases, even after finding that the workman deserves to be reinstated, the Supreme Court has made exceptions and persuaded the workman to accept monetary compensation for 'pragmatic' considera-

tions. Such 'pragmatism' by the highest court sends definite signals to the lower judiciary. It may enhance Saini's work greatly to examine the role played by the higher judiciary in bringing about the state of affairs described by him in the essay under review.

It is significant that when the subject changes to globalisation, industrial restructuring and industrial relations law in the third section, the underlying premise in sections 1 and 2 undergoes a change. Now the terms of discourse change. It is no longer the workers as human beings and the effects of the new industrial policies on them, but the inevitability of the globalisation process, in the face of which the worker must somehow fade away. This hiatus between sections 1 and 2 and section 3 is significant in the present context, for the very subject of globalisation seems to carry with it a sense of doom for workers. The point is whether this must be so?

In this section Mamkootam's essay on 'Industrial Restructuring, Technological Change and Industrial Relations Law' begins by describing the impact of technology changes on work organisation and industrial relations. Having set out the premise, it is possible to postulate that given the kind of changes heralded by the globalisation process, it is inevitable that labour is subjugated by the iron rule of capital, and equally inevitable that labour resists such subjugation. Or it is possible to prescribe the best ways available to labour to adapt and survive in the new economic context. The essay avoids both courses and thereby evades the issues posed by globalisation. Kher, on the other hand, smacks of typical management jargon that one hears day in and day out at any meeting of personnel managers. While personnel managers may have their own reasons for viewing the courts as condoning misconduct as suggested by Kher, it would not be too much to expect an academic work in a collection such as the present book to show greater insight and understanding of how and why things are what they are.

Had the book put together essays on the globalisation process, industrial restructuring and industrial relations law, keeping the worker and the impact of these changes on him as the key thread underlying the essays, the value of the collection might have been far greater.

Dispossession, Degradation and Empowerment of Peasantry and the Poor in Bengali Fiction

Tony Beck
Tirthankar Bose

While within the mainstream paradigm of peasant studies the peasantry and the poor are represented as apathetic and passive recipients of elite ideology, Bengali fiction reveals a more complex pattern of dispossession, degradation and empowerment of the peasantry and the poor.

FEW social scientists have turned to the literature of the society they are studying for insights into that society. There are some very significant exceptions, for example, the historian E. P. Thompson's reference to Wordsworth and Blake in *The Making of the English Working Class*, or the same author's use of Fielding and Defoe in his analysis of early 18th century Britain, *Whigs and Hunters*. It is a pity that there has been so little use made of literary sources, particularly in studies of rural societies, because novels, stories, and poems can provide much information that is otherwise hidden from even the discerning social scientist.

In an attempt to tap this promising methodological resource, we are going to take a cross-disciplinary approach to the Bengal peasant and poor, viewing these curiously anonymous figures through the optics of literature and peasant studies. Such an approach is of course fraught with dangers and perils – different frames of reference, different disciplinary methodologies, and different bodies of theory. We have made things more difficult for ourselves by purporting to deal with representation, a subject that has received extended comment over the last 10 to 15 years and particularly since Said's publication of *Orientalism*.¹

Beck introduces the article by looking at what we already know of the poor and the peasantry from rural studies in India as a whole, straying outside of Bengal, and then writes briefly about the socio-economic framework in Bengal from the mid-19th century onwards, within which the peasantry and the poor had to carry on their everyday existence. This sets the scene for Bose to continue with an historical exposition of changes in the representation of the Bengal peasantry in fiction from the early 20th century.

I

The Obscured Poor and Peasantry

In the late 20th century the Bengal peasant, like his or her 19th century British counterpart, remains an obscure and obscured figure. 'Peasant' continues to remain a term of both abuse and affection (affection for example in John Berger's set of stories, *Pig*

Earth). Recently there has been much interest in peasant strategies and peasant revolt, what James Scott has termed "everyday forms of peasant resistance", as well as a rewriting of the historiography of rebellion and revolt in South Asia from the subaltern's perspective (Ranajit Guha 1981-1987). These revisionist accounts have partly illuminated one particular aspect of peasant society. But we continue to rely on Marxist terminology, and more recently on feminist terminology, to describe the structure of peasant society. As a result, we know more about modes of production, landholding patterns, differential mortality patterns and the sex ratio in villages, than we do about the way in which peasants think, feel and act. In addition, definitions of peasantry and the poor remain obscure. One reads of marginal, small, medium and large peasants, most of whom might however be considered poor in contrast to the urban middle classes. In this article we note the difficulties involved with the use of such terms, but we do not try to redefine what either of the terms 'peasantry' or 'poor' mean.

If the peasant remains half in light, half in dark, the poor are an even more shadowy and anonymous set of rural inhabitants. What is meant by 'poor' is increasingly debated from several angles and disciplines – for example, economics, nutrition, rural development, political science. Each one of these disciplines dismembers and reconstructs the poor according to its own principles. From the dominant economic perspective (for example, the hundreds of articles on the 'poverty line' in India), the poor person is the archetypal 'economic man', who is transformed from a human being to an income or set of ciphers which are insufficient to raise him or her above the tantalising poverty line.

Reasons for the obscurity of the poor are not hard to find. There is an urban bias against the village and the so-called animal brutality of rural life. If one can escape this, it is still difficult to contact the peasantry, let alone the poor. Living in villages in India for extended periods is not easy for outsiders who are used to city life, but who are likely to be the main interpreters of the village voice. Once inside the village, it is still

difficult to find and talk to the poor or to women. Then there is the difficulty of interpretation. Can we trust what villagers have to say? Can we even understand what they are saying, because their vocabularies and insights are so different from ours? How do we differentiate between hidden and public transcripts, to use Scott's (1990) terms, between the face the poor put on for outside consumption and their real feelings? How do we deal with cultural 'norms', such as women internalising patriarchal norms and feeling they have more self-respect if they comply with 'purdah' regulations? The concepts of false consciousness and 'mental metricism' [Sen 1985] begin to rear their confusing heads. Under this optic, individual village studies can be discarded from an intellectual perspective as being subjective, lacking a general overview, and being too far from scientific 'hard' knowledge.

RESULTS OF COLLECTIVE IGNORANCE

Is this obscuring of the peasantry and the poor simply neglect, or is it a manifestation of the political framework within which most students of village society operate? This is an important question. One of the 'meta-debates' concerning development in rural south Asia has focused on the characteristics of the peasantry and the poor. Should the peasantry be considered as moral or rational? Are the poor hard-working entrepreneurs denied opportunity, or are they lazy and apathetic? Debates around these issues are often based on hypothesis and assumption rather than analysis of existing situations, and their distance from reality means that they are conducted at the level of pre-conceived ideas. This is particularly a problem when such debates feed directly into policy-making at the state or national level, as they often do. For example, the state will conceive different development projects partly depending on the view its planners take of the poor. To flesh out these ideas, here follows an analysis of the way in which mainstream North American political science discourse represents the peasantry, the poor and village relations.

The most influential North American political scientists writing on India over the

last two decades, in particular Barrington Moore (1987), the Rudolphs (1987), and Francine Frankel (1971, 1978) have used moral economy theory to explain changes in peasant society in contemporary India. Less influential academic accounts, such as Greenough's work on the 1943 Bengal famine or Marvin Davis' work on village society in Midnapore, have taken the same approach, and the example which follows extends to Bengal as well.

Moral economy theory, as used by many writers concerned with changing societies in developing countries, was fathered by E P Thompson in his essay, 'The Moral Economy of the English Crowd in the 18th Century' (1971). Thompson's view of the moral economy was that the rich and poor were bound in a ring of mutual antagonism and need, and that the poor in late 18th century Britain re-echoed the patriarchal ideology of subsistence for all to which the rich purportedly held, by making constant demands on the rich to uphold their duty to the poor. Thompson focused on contestation over resources and ideology, and his representation of the English peasantry was of a radical group who were active in the making of their own societies.² One can note in this analysis of demands made on the rich by the poor a similarity to rich-poor relations as described in the writings of Mahasweta Devi, which are analysed in the second section of this article.

The North American political scientists mentioned have developed their own bastardised version of moral economy theory. They postulate that the penetration of capital into subsistence agrarian systems erodes patron-client relationships that may have been unequal, but provided minimum security for all. The disruption of this security, and the increasing differentiation caused by capitalist development, is then seen to be followed by rural instability and peasant protest.³

In Frankel's work the erosion of traditional patron-client ties during economic modernisation is a key concept. Although what constitutes the traditional is never clearly defined, her most common use of the term comes in describing a breakdown in past agrarian relations, as is apparent from the following discussion of the effects of the green revolution in India:

Occurring as these changes are in a local context characterised by an erosion in traditional ties, and an incipient polarisation on the basis of class, it would not be surprising if efforts by political parties to mobilise social discontent for power purposes would lead to increasing instances of class confrontation in rural areas (1971: 45-46).⁴

Rudolph and Rudolph also comment on the traditional nature of pre-capitalist agrarian ties in India:

Under forms of traditional domination, the legitimising ideologies and power asymmetries of local hierarchies sustained interdependence with relatively stable local social equilibriums. Legitimising ideologies sanctioned rights and obligations as well as duties and dependencies by linking putatively nonantagonistic strata in harmonious social order (1987: 384-85).

Moore (1987: 358-59) also invokes the same idea of the pre-modern harmony existing in 'traditional' Indian rural society.

The assumption of the existence of a pre-modern 'harmonious social order' rests on the view that the lower castes and classes passively accepted the ideology of the prevailing order. Frankel notes an attack on "...the traditional village system under which harmony was preserved by the mutual acceptance of ascriptive inequalities sanctified by the religious myths of caste" (1971: 116). In Frankel's work the poor are variously described as 'resigned', 'deferent', and "deeply conservative and inert, strongly committed to the traditional social hierarchy of caste, and largely reconciled to their impoverishment" (1971: 10, 107, 177). A similar view is also taken by Moore, who writes of the "passive acceptance" of their situation by the lower castes (1987: 335). In her more recent work, Frankel returns to a similar refrain:

Village studies show that... asymmetrical obligations among unequals were oriented toward ensuring subsistence for all members according to their ceremonial and productive functions. Religious symbolism became attached to the notion of a 'hierarchical collectivity' in which the use of concentrated politico-economic power was circumscribed by moral obligation... As a result, it is arguable that commands by the dominant castes were perceived as legitimate and evoked a high level of predictable compliance for the lower castes toward whom they were directed (1989: 1).

Let us return to this passage in a few moments. The Rudolphs write in similar terms of the modern agricultural labourer. "We infer that isolation accompanied by normlessness and apathy has replaced decaying mutual ties in many other local contexts..." The term 'normlessness' here, again implies that labourers simply echo elite norms (1987: 387).

As well as being conceptualised as passive receivers of elite ideology, the poor are seen as increasingly susceptible to organisation by forces other than the 'traditional'. As Frankel puts it: "...high rates of economic development may actually exacerbate social tensions, and ultimately undermine the foundation of rural political stability" (1971: 8). This leaves room for communist agitation and the possibility that the poor will become convinced by "...the Marxist political propaganda that fundamental

social change can only be accomplished by the complete overthrow of the existing property system" (1971: 185).⁵ The Rudolphs also warn that the "dissolution of traditional interdependence and absence of a reconstituted moral order" may lead to "undeclared civil wars", the leading characteristic of these being "spontaneous, leaderless violence against property and persons" (1987: 389-90).

A political scientist of a newer generation, Atul Kohli, in his book on democracy and discontent in India, also wheels out the same patient for surgery and follows closely what has now become the 'traditional' construction of Indian social and political relations:

Economic development has generated new patterns of division of labour that have undermined traditional caste authority. The spread of commerce has similarly replaced seemingly reciprocal patterns of exchange with the impersonal medium of money, again undermining the traditional bonds of 'solidarity' between social 'superiors' and 'inferiors'. Unequal economic gains have also generated new types of tensions that increasingly resemble class conflict (1990: 485).

And so on. We are presented here with the received idea about the Indian peasantry and the poor - a group that is deeply conservative, a group that accepts passively elite ideology, that is inert, and a group that is subject to irrational violence when aroused by communist or other organisation. This picture of a sleeping giant ready to awake and overturn the foundations of society is one that has haunted liberal social scientists for decades. From the perspective of the planner and politician, many of whom are as out of touch with the peasantry as Frankel and her colleagues, this sleeping giant is a Gulliver-like figure that has to be pinned down by various methods of social control - and this is what is meant by representations of the peasantry and the poor feeding into policy-making. Such extreme views of social relations cannot help but influence how external intervention to deal with village problems is determined.

CLOSER VIEW OF VILLAGE LIFE?

Let us return to that quotation from Frankel: "Village studies show that... asymmetrical obligations among unequals were oriented toward ensuring subsistence for all members according to their ceremonial and productive functions." Frankel unfortunately only mentions in passing one of the studies she is thinking about; but it is fortunate that there are a select number of ethnographies from South Asia that deal closely with the life and life-styles of the poor, and which challenge the standard representations of the poor that come from the world of political science. It

will be useful to mention a few of these and then summarise what is common in their findings. One thinks of Breman's study of changing labour relations and migration in Gujarat (1979, 1985), which is the only major longitudinal study from India we know of that specifically sets out to examine the condition of the poor within local power structures. Other excellent case studies are Jodha's work on poor people's perceptions of poverty in village Rajasthan (1989); and Mencher's research in Tamil Nadu on untouchables' 'rejection of brahminical ideology, a rare analysis of the view of the power structure of the exploited [Mencher 1975, 1980]. *Labour Pains and Labour Power* by the Jefferies and Lyon (1989), a study of gender roles, childbearing and patriarchal ideology in Uttar Pradesh, is a vital account of the complex nature of female oppression, much of it in the villagers' own words. Details of grass roots organisation among untouchables and women can also be found in Joshi (1986), Kishwar and Vanita (1984) and Illina Sen (1990). Oral history remains another important method for representing the viewpoint of the poor, but apart from the book *Untouchable* by Freeman (1979), and studies concerning poor people's uprisings [Stree Shakti Sanghatana on Telengana 1989; Cooper on Tebhaga 1984] no significant work appears to have been carried out in this area.⁷

What can one learn from this scattered evidence concerning poor people's priorities and how they experience poverty? First, it is clear from this literature that poor people do not always subscribe to the dominant brahminical or other ideologies. Rather, they assert their own identities, identities which are usually closely tied to the material circumstances of deprivation and exploitation in which they find themselves. Second, poor people feel sympathy for, and identify with, their fellow poor, and help other poor people where this is possible.⁸ Of course there are converse findings from village studies which show how untouchables or other subordinated groups have internalised dominant ideologies or do not support each other [Bandyopadhyay and von Eschen 1988; Moffat 1979], but these go against the trend of the ethnographic literature that has attempted to interpret the village through direct contact with the poor.

Of course all of the studies we have mentioned are interpretations of village society from the outside. Tirthankar Bose has reminded me that we rarely hear the indigenous voice of the peasantry or the poor, except occasionally in songs. But it is clear that the representation of the Indian peasantry and poor in peasant studies is itself an important area of contestation, important because how we choose to represent the poor determines to a large extent our actions towards them. The representations of Joan

Mencher and Jan Breman, who have spent time living close to the poor and peasantry in villages in India, rather than the political scientists who come with pre-conceived notions and ideological pretensions, seems to be more worthy of trust. These close accounts of the poor would contribute to an alternative kind of policy-making, one in which the poor are seen not as a dangerous sleeping giant but as a group that can contribute positively to the making of their societies.

SOCIO-ECONOMIC CHANGE IN BENGAL

The main point to note concerning socio-economic change in Bengal is that the peasantry experienced a secular decline in standards of living and quality of life from about the middle of the second half of the 19th century. There were a number of interlocking geographical, political, and economic reasons for this. During the 19th century, the river systems in West Bengal continued their move eastwards, turning West Bengal into a moribund delta. The construction of rail and road embankments from the middle of the 19th century, in the words of Sugata Bose (1986: 44-45), "played havoc with the fast deteriorating drainage system of the region", leading to decreasing soil fertility and stagnating yields. The number of agricultural labourers and sharecroppers grew throughout the 19th century; reasons for this included the influx to the state of large numbers of tribals who worked in plantations in north Bengal or clearing frontier regions; indebtedness which led to landlessness; and the displacement of rural artisans from traditional occupations. Declining yields and increasing population growth, particularly in the 1930s, were among the causes of the Bengal famine, and this secular decline has continued up until the 1970s at least. By the 1970s, landless agricultural labourers made up about 35 per cent of the rural population, and within these agricultural labourer households, female-headed households and widows, doubly oppressed by patriarchy and class, could be considered as the poorest. The Bengal peasant now finds him or herself in the unfortunate position of living in one of the poorest regions of India. Since 1977 and the dominance of the Left Front there have been improvements in the position of the poor in some areas, but this is the subject for another article.

II Through the Literary Looking-Glass

Despite the efforts of historians, economists and sociologists, the rural poor of India remain a problematic. We do know a great deal about the measures of hard resources that spell poverty, the political

acts (or lack of such acts) that characterise people in such conditions, and the social exchanges that bind them as a class. But the quantifiable data give us the profile, not the face of the human beings who live and die in India's villages. Who are the poor? It may be that we will never quite know the truth, especially within the confines of the social sciences. For that matter, I doubt that the resources of imaginative perception will lend veracity to any one conception of the poor, but at least the impersonalities of quantification may yield to portraits that claim engagement, a claim often of dubious virtue, for portraits represent the painter as much as the subject. Art, like science, views from the outside.

What is beyond doubt is that the poor confront the Bengali writer on every side. The experience of poverty, particularly rural poverty, is so central to the Bengali writer's psyche that it can only prove the centrality of poverty in Bengal's social experience. From Dinabandhu Mitra's play *Neel Darpan* and Bankimchandra's essays on the Bengali peasant to the fiction of Samarendra Basu and Mahasweta Devi, the poor have systematically displaced the idealised images of humanity that modern India inherited from its own classical tradition and from British literature. I have not counted plots, but it seems a safe bet that at least half the Bengali stories and novels written in the last hundred years deal with the poor. Does this persistent concern bring us closer to the poor? Or is it an obsession that distorts the representation? The answer will be ideologically loaded and will not serve the social scientist in the way Tony Beck hopes it might. But this at least is certain, that in Bengali fiction the poor have become a central site of imaginative action played out by contending social perceptions. This demands a sustained study, to which the present look at a few representative works can at best be a modest prolegomena.

It is fair to recognise that the literary representation of rural life has not always been a painful dirge. A sweeter strain can be heard in the pastoral tradition, which is of respectable antiquity and upheld by poets as well as storytellers such as Kalidas Roy, Jasimuddin, Rabindranath, Satyendranath Datta and Nazrul Islam. One of my favourite childhood books was *Bhombal Sardar*, a picaresque tale of a young boy's adventures in a Bengal flush with autumnal plenty. In more recent times Abdul Jabbar has written lyrically of life in the villages around Calcutta. But this comforting vision exists precisely because it sees the poor only as relatively disadvantaged, not as persons facing or in a state of total dispossession. In these works rural life is one of abundance, health and integrity, invoking memories of a mythologised golden age of pre-industrial India. Not surprisingly, these odes to

Recent Perspectives of Early Indian History

Edited by
Romila Thapar

Over the last couple of decades the study of History has gradually changed. History is no longer a mere study of the events of the past but its scope has broadened. Along with discoveries of new inscriptions and relics, hitherto neglected areas like socio-economic, environmental, ecological, linguistic and historical changes, have slowly come into focus in recent writings. This subtle but identifiable change in perspectives has led to History being regarded as a Social Science. One development resulting from this is the adoption of an interdisciplinary approach.

This volume of essays, serves as a unique guide to new interpretations of early Indian history currently being discussed by historians and other scholars working on India's past. Each chapter covers a specific theme from a chronological period. This volume is intended to draw the attention of students of Indian History to some of the recent work on the various aspects of early Indian History.

The time has come when the younger generation has to be told, in clear language, what was really noble and progressive in our ancient past, and what was reactionary, oppressive and unjust. They must know what they have to be proud of and what has to be renounced and rejected.

This book deals with the period from the Rig Veda up to, roughly, 1200 AD i.e. the arrival of the Afghans and the Turks.

A running conflict took place between progressive and conservative forces in all spheres of social life and thought during this long period. It was expressed in our economy, politics, social and religious life, philosophical and scientific development. The purpose of this book is to bring out this conflict and relate it to the contemporary struggle between progressive and reactionary forces in India.

Bengali joy pipe but faintly against the discordant notes of rural crisis in colonial and post-colonial Bengal. The glory of Rabindranath's, Nazrul's and Jibanananda's enchanting Bengal fades into darkness as they speak of the dispossessed.⁹ In our times this passage of the Bengali writer from delight and hope to fear and anger, a passage too from the romantic to the realistic, is perhaps best seen in Bibhutibhusan Bandyopadhyaya's uneasy yoking of life and death in *Pather Panchali* and *Ashani Sanket*.

Despite the idyllic image of rural life that is part of the tradition, the great majority of stories of rural Bengal are uncompromising in recognising poverty as the overriding condition of rural life. To the social scientist 'poor' may be a relative term, but there is little ambiguity in the conception of the poor in Bengali fiction. Poverty means dispossession. So powerful and widespread in this vision of the poor, so apocalyptic, that Bengali narratives become locked into an insistent plot pattern: peasant or artisan families that are barely scratching out a living in a failing economy within an inimical social organisation are faced with a crisis in the form of debts or sickness or famine, or often all of these together. As a result they lose what little they possess, surviving physically by selling themselves into functional slavery, the men becoming the landlord's or moneylender's creature and the women prostitutes. The social event is the break-up of the family which is a microcosmic representation of the breakdown of civil society. The moral event is the brutalisation of human beings.

Within this general format the poor are portrayed as one of three types. The most common is the timid, trusting peasant or artisan who knows the forces driving him/her to ruin but feels helpless in their grip. A second type is the man or woman reduced by want to a bestial level at which all human understanding have been eroded. The third type is the polar opposite in being not only aware of the nature of the threat but also resolved to oppose it. Not surprisingly, these constructions derive from separate ideologies, although they often merge into a complex pattern of shifting attitudes, from despair to militancy to hope.

THE DISMEMBERED VILLAGE

This complexity has lent as much variety to the conception of the poor as to narrative structures. A case in point is Tarashankar Bandyopadhyaya's *Panchagram* (Five Villages). The novel records through the eyes of a village schoolmaster, Debu Ghosh, himself of peasant origin, the accelerating decay of a vast area of rural western Bengal through the 1920s and 1930s. Debu, who has lost his wife and child to disease, now devotes his life to the welfare of his extended

community of poor Hindus, Muslims and outcastes, including individuals of particular vulnerability such as Durga, the village prostitute, and Padma, the abandoned wife of his blacksmith friend. The crisis of the community is one compounded by crop failures, epidemics and rising taxes. Traditional defences fail because the world of the Five Villages has changed, and landowners such as the parvenu Srihari Ghosh disavow the age-old duty of the rich to feed the poor, ignoring Debu's negotiating powers and even the moral authority of the brahmin patriarch Nyayaratna. Debu's people have neither the wherewithal nor the will to fight the crisis, and their downward slide into ruin becomes irreversible. Debu's political initiatives do not work in the face of this inertia. Nyayaratna's communist grandson makes even less of an impact. The economic decay of the community is reflected in its moral decay. Social sanctions against Debu engineered by Srihari Ghosh readily pass on charges of immorality even though the villagers continue to trust Debu. Realising that the redemption of the people can come only in a new age to be brought about by India's independence from British rule, Debu joins Gandhi's freedom struggle, goes to jail and returns to find his community still more weakened. Death has claimed many, agriculture barely survives because people have migrated to cities in search of work in factories, the Srihari Ghoshes are in still greater control. Yet a new generation represented by a brother and sister pair, Gour and Swarna, who were Debu's proteges, keeps Debu's flag flying. Rediscovering in them his vision he resolves to forge ahead, rebuilding his programme as well as his personal life by marrying Swarna.

The panorama of misery and failure in the novel seems to make the logic of decline unbreachable. Given the conditions Tarashankar so faithfully records (on the basis of intimate personal knowledge), what redemption can there be? Yet the tale ends on a meliorist note that can be the product only of the writer's ideological intervention. The narrator begins with a retrospective of the prosperity of the region but also lets us know that those days are gone. Then as now the land belonged to the landowner, not to the tiller who would pay rent with his produce as well as free labour, but on his part the landowner would forgive or at least defer revenue collections at times of want and finance public works. In that golden age even calamities proved the strength of society's moral fabric: "In times of want the landowners and the local rich used to help out" (p. 193).¹⁰ Tarashankar's historical assumption here is the same as that of what Tony Beck calls the "bastardised North American version" of EP Thompson's moral economy.¹¹ Now, however, the reciprocity of power and resource relations has vanished

and the legitimising ideologies have fallen into disuse. The owners no longer allow defaults. When they can they foreclose, often by shady legal proceedings aided by the corrupt police and government officials. The peasants, particularly the more spirited lower castes and the Muslim tenants, mutter their disaffection, but do so ineffectually. Debu Ghosh's efforts to achieve reasonable compromises fail because the system is too strong, the landlords are too rich and wily, they have the support of the police and district officials, and the peasants have no fallback savings or prospects to sustain them through a contest. Note that not only does Tarashankar have a clear view of the events constituting poverty, he also insists on demonstrating, even commenting on, their causes. At several places in the narrative he builds up the crisis to a point at which the militant stand taken by Raham Sheikh or Tinkari Mandal seems an unavoidable response. But at every such critical moment Debu's idealistic option of negotiating the community back to the golden age takes over, leaving his community gripped in its downward spiral. The iterative force of the view of Panchagram's decline is Tarashankar's own:

Allar duniya shaitane dakhai karya nile [Satan has taken over God's world]. - Raham Jamidarke rajshakti adhikar samarpan kariyacche [The state has surrendered its power to the landlord]. - author
Panchagramer manush sarbaswanta hoiya giyacche... prati barite bhangar dhariyacche [The people of Panchagram have become paupers... every household is breaking up]. - Debu
Manushguli jeno sah kemon hoiya giyacche [How strange everyone has become!]. - Debu [Bandyopadhyaya 1972, my translation: 73, 86, 287, 288].

How does this realisation lead to Debu's final vision of triumphant rural prosperity? Only an ideology committed to a self-deluding nostalgia can turn imaginative perception so completely inside out. The result is a fractured literary construct in which the realistic mode abruptly surrenders to the symbolic, images of ruined cottages fade out to make room in the novel's last sentence for the hero holding hands with his new love against a frame of "the sun arising out of the darkness - today's dawn marching through the moments, the hours, days and nights towards tomorrow's". Caught between hard reality and liberal sensibility, the novel takes on an ambiguity in regarding the pauperised peasantry that is rich as an imaginative product but no less troubling than the obscurity of the poor behind the social scientist's statistical smokescreen.

"IS MAN NO MORE THAN THIS?"

One of the alternatives to this meliorist view swings to the bitterest opposite. Even

in as early a work as Saratchandra Chattopadhyaya's *Srikanto*, the poor are frequently placed on a subhuman level. In Part 3, Chapter 12 of this influential novel, Saratchandra describes labourers uprooted from their villages and brought to work on the railway. Their reality has narrowed to filling the belly, copulating and dying. All human feelings have atrophied so that their only response to suffering – their own and that of others – is passive acceptance. The author's comment is: "This is what an animal is!... Such patience is subhuman." How did they sink to this? He explains: "These people have been alienated from all natural bonds of family and society so that they can endlessly toil... because unless human beings are turned into animals, animal labour can't be drawn out of them" [Chattopadhyaya 1985: 428-29; my translation].

The author's horror and disgust underscores a deep rage at what he discovers at the root of poverty. Merely implicit here, that rage comes to a sharper focus in Saratchandra's short story 'Mahesh', named after the central character Gafur's beloved pet buffalo. Gafur struggles under a double misfortune: he is poor and he is a Muslim. Instead of enabling him to feed his only child and Mahesh, the hardships he silently bears force him evermore into the punitive clutches of the village power structure. Finally, maddened by want and failure he lashes out at Mahesh, killing one of the two beings he loves most. Then, as he leaves the village for the town jute mill holding his daughter by the hand he looks up at the dark night sky and cries out: "Allah! Punish me as you please but remember, my Mahesh died of thirst. Nobody let him graze on the smallest plot of land. Do not forgive those who denied him the grass of your fields, your water to slake thirst" [Chattopadhyaya 1985: 1733].

In the grief and anger fuelling this passage we see a characteristic feature of Bengali fiction. Description here leads to explanation and marches on to a call to action; the author changes from witness to judge. Often, though, the weight of experiencing the poor creates a black hole from which the author's judgment cannot exit. Samaresh Basu's 'Aam Mahato' is such a tale. In it life is merely biological survival, in pursuit of which a rice-for-wife exchange is an instinctive imperative for the central character. Powerful body imagery fixes Mahato's dehumanised state in the viewer's eye: his near naked body barely senses the breeze and the sun; the rag he wears is stripped off him by the village policeman looking for hidden sheaves of rice. The only thought that stops him from bartering his wife for a rupee to the policeman is that she might bite and scratch the man who might then beat Mahato in revenge. Eventually he does barter her to a rich trader whose throat she tears out, and the story ends with the wife led away by the police as Mahato gobbles rice, his eyes playing in his

imagination over the rippling bodies of the sleek oxen he had lusted after in exchange for his wife's body. The insistent body imagery turns the human into the animal, sexuality into bestiality.

The process to which Saratchandra and Samaresh Basu bear witness is one of the loss of material possession, which forces on them the loss of all human dignity, freedom of action, perhaps even belief and eventually human identity itself. If there is ideology here, it is overwhelmed by experience which silences authorial comment. In these, the bleakest narratives of poverty, the poor are victims of a world that denies them even the minimal dignity that is implicit in the term 'decline'; because it is a process, decline implies a past state of relative well-being and worth. But in the examples given, poverty is not a process but a state. The human figures are human only biologically, not socially or morally.

Perhaps because imaginative perception can dive no lower into the decay of humanity, a different voice begins to be heard in Bengali fiction since second world war. The reduction of humanity is countered by the very pauperisation that denudes the human. Samaresh Basu himself represents this school well. His short story 'Pratirodh' begins by recalling the great Bengal famine of 1942. The famine is gone but the peasants are little better off because half of what they produce as sharecroppers is taken away by the landowner. They demand a two-thirds share (the historical backdrop is the Tebhaga movement), and although the forces ranged against them have beaten them into submission time and again, they band together and swarm upon the fields to take what is theirs: "They will fight, they will give their lives, but they will shake off their necks the burden of the ages." The landlord's thugs launch a spree of murder and rape but are driven away by the village women. Resistance triumphs but at a terrible cost in lives: Rahim is killed and Radha, a central figure, dies with her pregnant stomach slit.

RESISTANCE AND REDEFINITION

This situation becomes a common plot pattern in Bengali fiction of the 1950s. Samaresh Basu is in fact antedated by Manik Bandyopadhyaya in countless stories of rural life, all telling of the poor pushed to the wall and realising their only option is to fight back. They are no better led or equipped than Tarashankar's peasants, except that hunger and want prove too much for the legitimising ideology of subservience and fatalism to keep them passive. The hero of 'Mejaj' (hot temper) gets into fights with everyone over the slightest provocation, defies authority and beats his wife for fancied offences. Because of his visibility in resisting extortionate laws, the zamindar's men attack

his hut, tie him up and gang rape his wife. When they leave he shows no anger. Confounding everyone's expectation he persuades the villagers in the calmest tone to keep up the resistance, citing his wife's violation. Then one night as the thugs attack another family he pounces upon them and shows what 'mejaj' really means.

Yet another iteration of the same theme and the same plot pattern occurs in Nani Bhowmick's story 'Salimer Ma', which centres on the Muslim peasant couple Moin and his wife, the latter known only as their son's mother, Salimer Ma. Despite the hardships of successive crop failures and the death of his son, Moin holds on to his sense of what he thinks is Muslim family decorum, and is enraged at the thought of other men seeing his wife unveiled, as she would be if she were to take up domestic service. Maddened by poverty, he joins other sharecroppers to seize the crop against the threats of the leaseholder, Karam Ali. When Ali's thugs come to take the crop away, Salimer Ma holds the sheaves to her body. Even though they beat her and strip her she does not let go until the villagers come to her rescue. As she weeps at her dishonour, her fierce husband comforts her, the myth of female honour set aside in the light of a refashioned reality.

The construction of political reality that imposes this pattern on Bengali fiction is at least partly propagandist, inviting the poor

to militant action. It is not an accident that it was about the time that these stories began to appear that the Progressive Writers' League was formed with the express purpose of showing life as it was,¹² and at least for the large left-wing contingent it was a platform to call the proletariat to arms. The reversal of the earlier pattern of passive suffering to one of militant self-determination is only too obviously founded in the doctrine of the dispossessed having nothing but their chains to lose.

To give the doctrine social reality the writers focus on human figures that acquire a symbolic status in the process of telling the tale. The commonest figures are the Muslim peasant and the female because they survive at the very bottom of the social pile. The raped woman in particular becomes the symbol of the kind of suffering that is not an accident of history but a condition actually required by the power relations of an expropriative society. In the stories noted above, and many others, the agonies these figures suffer are demonstrated to be socially constructed rather than a product of fate or nature or innate flaws of character. Yet in a sense, the militant vision of these writers is self-defeating. Even as a description of rape arouses rage it invites mourning and concedes the disempowerment of the oppressed, which is offset by no energising resolution that might build upon loss. Radha's husband dissolves into tears, Salim Ma weeps: "The bandits shamed me." No re-affirmation of the poor's personhood arises on the wreck of self-esteem.

It was in the 1970s that an entirely new construction of the poor was achieved in Bengali fiction by Mahasweta Devi. Working in the tradition of activism and life-sharing among the poor, a tradition served by both Saratchandra and Tarashankar, Mahasweta shows us not only that being poor is a socially constructed state and thus open to transformation, but also that defeat and loss may paradoxically be victory and gain. The narrative and rhetorical strategies she uses lead to the perception that 'poor' is an arbitrary term filled with deadwood from outmoded cultural norms, which makes a redefinition of the self-in-society a necessary and possible precondition for the empowerment of the weak. This essentially subaltern view of society is radically different from the prescriptive imaging of reality we have noticed in other writers, which explains why we have in her fiction images that achieve an altogether different texture and resonance even though she uses the same figures of the peasant and the female.¹³ Probably her best known story in this mode is 'Draupadi', which narrates the arrest of the militant tribal woman Dopdi Mejhen and her interrogation by her captors led by a commander, an intelligent, educated man to whom she is an object of scientific political study. He treats her courteously through the

period he has decided requires civility, that is until dinner time, when he leaves instructions to make her pliable. In a lifetime of reading I have not come across a more forceful word than the Bengali word Mahasweta uses for the commander's instruction: "Oke baniye niye esho". The verb 'baniye' here is the same word as 'dressing' a chicken. Word and deed (of repeated, bloody rape) thus join into a semiotic event that carries an incomparably greater load than clinical description. The dehumanisation of the powerless seems even more irreversible here than in the narratives we have discussed. But in a triumphant irony the lowest point of Dopdi's life becomes the highest. After waking up from her post-rape coma she walks up to the commander:

Draupadi comes closer. Hands on hips, she laughs and says, "Your hunted woman, Dopdi Mejhen. You told them to make me up, so don't you want to see how they have made me up?"

"Her clothes—where are her clothes?"

"Clothes? What's the use of clothes? You can strip me, how are you going to clothe me? A man, are you?"

Draupadi advances on the commander, pushing him back with her torn breasts, and this is the first time the commander feels fear in front of an unarmed target, a terrible fear. [Devi 1987: 108, my translation].

Roles have been reversed, power relocated and human worth redefined. The inevitability of the plot pattern that is a mark of this type of narrative invests the central figure with a presence that fills the viewer's eye and then, instead of remaining a motionless emblem of grief and loss, that figure acquires control over her reality, assuming not just militancy but moral supremacy. The very objects of defeat become the weapons of victory. Note that Mahasweta is using the same narrative pattern as Manik or Samaresh and particularly the same symbol of dehumanisation, the raped woman.¹⁴ The difference is that precisely at the moment when the reader is asking, is a human being no more than this, the writer transforms that symbol into a trope which elevates the reader's perception to a redefinition of humanity by eschewing arbitrary constructions of worth into an icon of inalienable rights. In contrast to Manik and Samaresh, whose very sympathy for the violated poor turn them into subjects of patriarchy, Mahasweta's chilling disengagement accords the poor autonomy at the same time as it bridges the distance between the perceiver and the perceived. Uncharacteristically for Bengali fiction, the romantic idealisation of spirit over body yields to the revolutionary realisation of the dispossessed reclaiming their world.

In this perception of the poor pressed upon the reader, the poor cease to be the alien and metamorphose into the viewer in an

imaginative event, the remaking of the viewing self. Does this remaking have a social equivalent, a social policy implication? The temptation to think so is underwritten by long traditions of didacticist literary theory, from neo-Platonist to Marxist, and may well be a necessary position, but we must pass it by in the interests of pursuing the problems of representation. Its significance here lies rather in forcing upon literary as well as sociological scholars the intensity of the experience of poverty in Bengali fiction, which pulls into its orbit the narrator's sensibility to a point where the narrative teeters between the fundamentally separate potentialities of representation, one driven by a direct political agenda, the other by a cathartic recognition. These alternatives are reflected in the texts I have considered in this article, most powerfully in the works of Manik Bandyopadhyaya, Mahasweta Devi and Samaresh Basu.

Mahasweta Devi's work includes the modes and values of traditional Bengali fiction even as it transcends them. While all these stories are pre-eminently realistic, the narratives tend at critical moments to be caught in the meshes of authorial intervention whereby ideologically mediated conclusions are forced upon them. The revolutionary sympathies of Manik and Samaresh are no less controlling of the poor than the ameliorative romanticism of Tarashankar or the disgust of Saratchandra. The poor become the author's political creatures; in contrast, Mahasweta shows a way in which the poor may be seen as autonomous even as they emerge as the icons we build out of our own sense of worth.

Notes

- 1 The literature on Orientalism is extensive. For different perspectives, see Inden (1986) and Kabbani (1988).
- 2 In his recent volume *Customs in Common* (1991), Thompson reviews 20 years of use of moral economy theory, and states that the theory has now come of age.
- 3 Moore (1987) takes a different perspective from the other writers discussed, in that he views a lack of penetration of capital into subsistence systems as the reason for peasant revolt, because this leaves patron-client relations intact as a vehicle for peasant mobilisation. However, despite this difference, Moore's representation of the peasantry is very similar to that of the other authors discussed.
- 4 Frankel reiterates the same view elsewhere (1978: 8, 21, 26, 582; 1971: 38, 40, 208).
- 5 Seavoy (1986: 260) also suggests that the main characteristic of the precapitalist peasant is laziness, and Bauer comments on "the widely prevalent and readily observable torpor and inertia of the population of the Indian subcontinent..." (1976: 191).
- 6 For similar comments see Frankel (1978: xii, 3, 21, 580).
- 7 Representations of the experience of the poor can also be found in Marathi literature and

- songs [Miller and Kale 1972; Omvedt 1977].
- 8 This does not mean that there are no divisions among the poor (fostered by indigenous elites or otherwise), or that they do not compete with each other, as Breman's studies make clear.
 - 9 For a telling contrast, compare Rabindranath's 'He matah banga shyamala anga jhalicche amala pravate' with his 'Dui bigha jami', the first a paean to the deified Mother Bengal resplendent in the light of dawn, the second a tale of a rich rural landowner robbing his poor neighbour of his only property, a mere two acres of land, and sending him to jail in the bargain.
 - 10 All text references are to the editions cited in the References.
 - 11 A similar view of relationships is taken by Bankimchandra in 'Bangadesher Krishak' (Peasants of Bengal), but note that he attributes the erosion of reciprocity to the Permanent Settlement of land by the British [Chattopadhyaya 1970: 305].
 - 12 Formed on April 10, 1936 in Lucknow with Munshi Premchand as president, followed by the Bengal Progressive Writers' League on July 11. Tarashankar was a member for some years.
 - 13 For a sense of the categories that control Mahasweta's priorities, see Kalpana Bardhan's note [Bardhan 1990: 46, n 24]: "Mahasweta... was not sure whether she should give priority to speaking on women's condition over getting the tubewells [for marginal communities]."
 - 14 I limit my references to these authors as they are the most distinguished representatives of this particular tradition. But similar perceptions, perhaps of less gripping force, are widely found in contemporary Bengali fiction, particularly in the active little magazine arena.

Improving Sales Tax Management in India

Mahesh C Purohit

Proper management determines the effectiveness of a tax system. Failure to properly administer the tax defeats its purpose and threatens the canon of equity. It increases evasion of tax and creates a parallel economy. Over the years there is an increasing realisation that in practice administration is law.

In view of the important role of tax management in achieving the objectives of the given tax policy, this paper analyses the features of sales tax management in India and suggests possible improvements in it. In doing so, it presents the organisation for tax administration, analyses the operation of the tax including management information system (MIS) and suggests plausible improvements in both administration and operation of the tax.

The policy prescriptions for improving sales tax management are particularly relevant in view of the proposed move to introduce a system of value added tax to replace sales tax in the states.

TAX administration plays a crucial role in determining the effectiveness of a tax system. Improvements in administrative procedures and organisation are important to tax payers as well as administrators. As Casanegra and Bird (1992) say, the subject of tax administration is extremely important both to those concerned with the key role increased tax yield can play in restoring macro-economic balance and to those concerned with tax policy and its effects on the economy in general.

Failure to properly administer the tax defeats its purpose and threatens the canon of equity because full payment is then made only by those whose elasticity of conscience is such that they cannot do otherwise [Oster 1957: 157]. It may further increase the evasion of tax because the large amount of evasion breaks the morale of the honest tax payers. Also, a poor quality tax management may collect large proportions from easy-to-tax sectors [Casanegra and Bird 1992] thereby further creating intersectoral inequity in the incidence of the tax.

In view of the important role of tax management in achieving the objectives of the given tax policy, this paper analyses the features of sales tax management in India and suggests possible improvements in it. Section I presents the organisation for tax administration. Section II analyses the operation of the tax including management information system (MIS). In analysing all these aspects it takes note of the past trends. The final section makes suggestions for plausible improvements in both administration and operation of the tax.

I

Organisation for Tax Administration

Sales tax administration in the Indian States could be analysed under four heads, viz, (i) Headquarters organisation; (ii) Administrative organisation; (iii) Enforcement organisation; and (iv) Appellate organisation.

Headquarters Organisation:

The organisational leadership of the Department is provided by the officers of

the Indian Administrative Service (IAS). However, in some states, where the tax yield is growing but has not made any significant mark, this leadership is not really forthcoming from the IAS cadre. The commissioner, who is a IAS, heads the department with no prior working experience of that organisation, takes time to get to know its working to be able to provide guidance for policy formulation. Thus, the tenure of the commissioner is important for efficient functioning of the department. However, a study of the tenure of the commissioners in many of the states reveals that the post is generally a transition for the incumbent in the IAS cadre. The posting in the sales tax department is tantamount to a stopgap arrangement. In some cases, it has been observed that the commissioner of the state lasts for a few months only. Under these circumstances, the department functions without any effective leadership. This is detrimental to its performance and efficiency. It is obvious that this practice needs to be changed, either by assigning the commissioner a minimum tenure in the department or by appointing a commissioner from the finance services in the state.

The administration at the headquarters is under the direct supervision of the commissioner. The commissioner is designated as commissioner of sales tax in Jammu and Kashmir, Gujarat, Maharashtra, and Delhi; as excise and taxation commissioner in Punjab, Haryana and Manipur; as commissioner of trade tax in Uttar Pradesh and as commissioner of commercial taxes (CCT) in other states. Notwithstanding the variation in the designation and nomenclature of the department, his functions and purposes in all the states are identical, except in Punjab, Haryana and Manipur where the work relating to state excise is also entrusted to this department.

Whatever the nomenclature of the department, usually in the hierarchy, immediately below the CCT there are additional commissioners of commercial taxes (ACCT) or senior deputy commissioners of commercial taxes (DCCT) or joint commissioners of commercial taxes (JCCT). These officers work directly under the superintendence of the

commissioner and exercise the powers delegated to them. Normally, one of these ACCTs works as incharge of legal section; the other is given the charge of enforcement or vigilance. The additional/joint/deputy commissioner is responsible for the work related to vigilance and tax evasion; and the joint commissioner is incharge of appellate and statistical work.

Next in line to addl/joint/deputy commissioners is the assistant commissioner (AC). Where the organisational structure is strong enough, the JCCT looks after the major sections of the department at the headquarters and the DCCT/AC assists the JCCT. In such cases AC is looking after the area/range/zone in which the state is divided for administrative purposes.

Administrative Organisation:

The administrative organisation of the department follows a two-tier system; the first is the division and the second is referred as circle, which is the ultimate unit for the administration.

The division is headed by joint commissioner (Adm). The distribution of administrative work by divisions is mainly on a territorial basis. Normally, there are 10 to 15 divisions in larger states and four to five divisions in smaller states. The third-tier known as circle, comprises a district. However, the formation of a circle is mainly on the basis of the overall workload. If the work in a district is not sufficient to form a circle, two districts could be joined together to form the jurisdiction of a circle. Similarly, more circles could be carved out of a district when the workload justifies it. There are also cases of formation of subcircles within a circle. This, of course, depends upon the workload in a particular circle.

The circle is generally headed by an AC. At the circle level, the assessment work is done by the AC and the commercial tax officer (CTO) who is assisted by the additional CTO as well as the assistant CTO. Commercial tax inspector (CTI) represents the lowest level of the basic administrative cadre of the department. The CTI assists the assessing authorities in conducting market

surveys, verifying the bona fide of the dealers, sending requisition for registration and looking into irregularities. Its role is crucial in administration of the tax at the grass roots level. In some of the states this designation has been abolished and the lowest level is that of ACTO in junior grade called ACTO-II. In these states, these ACTOs perform the field duties.

Enforcement Organisation:

The enforcement work is undertaken at the divisional level. In the organisational structure of the enforcement wing the AC is in overall charge of the enforcement work at the field level. However, at the headquarters level he has to report to the DCCT or to the CCT. The work of the enforcement personnel at the field level involves surveys and investigation of places of business, seizure of books of accounts, and reporting on malpractice. In order to perform these tasks, this wing collects information from various sources such as railway station, transport organisation and octroi post.

In most of the states checkpoints have been established by the department for the enforcement of the tax. The rationale for establishing checkpoint lies in the need for monitoring the flow of goods into the state through the main arteries of inter-state trade. The checkpoints record the flow of goods and keep the relevant circles informed about the import of taxable goods by dealers in their jurisdiction. They are located either at the borders of the state (termed as border checkpoints) or in the vicinity of the important towns within the states (known as internal checkpoints). The former could be termed as border checkpoints and the latter as internal checkpoints.

Appellate Organisation:

Because of the possibility of abuse of discretionary powers by the assessing authorities and of errors in the interpretation of law, the tax administration provides for the right to appeal, revision and reference. In most of the states there are three-tiers of appellate organisation. The initial appeal is made to the DCCT (appeal), who works as the first appellate authority. The work is territorially distributed. The DCCT works under the superintendence of the JCCT (appeals). A revision petition against the order of the DCCT can be filed before the JCCT (appeals). The second revision against the findings of the JCCT (appeals) is filed before the commercial taxes tribunal. In many of the smaller states this appeal is made to the revenue board. The tribunal or the revenue board consists of members from different walks of life. Normally they are drawn from the judiciary, accounts and taxation services.

Besides these regular channels of appeals, the CCT exercises *suo motu* powers of

revision either on his own or on the basis of the petition filed before him. In cases involving points of law, reference can be made to the high court. The judgment of the commercial taxes tribunal/revenue board is final.

II

Operation of the Tax

The basic procedure of tax administration and enforcement is determined by the structure of the tax. The existing structure being predominantly a tax on the first-sale in the state, the first seller (importer or manufacturer) pays the tax. All subsequent sales of a commodity (known as tax-paid goods) are exempt. Hence, enforcement of the tax entails two important tasks: (i) ensuring that the first seller pays the tax, and (ii) verifying that the following dealers have documentary evidence to prove that the goods are already "tax-paid". In contrast, the last-point levy which is in vogue in some of the states, is collected at the time of sale by the last registered dealer to a non-registered entity, that is, the collection of tax is deferred until the last stage. Accordingly, the task of checking relates to (i) ensuring that the last dealer pays the tax, and (ii) verifying that the sales have been made to a bona fide registered dealer.

The tax department employs two devices to carry out these tasks. First, all manufacturers without exception are required to be registered. This ensures that goods manufactured within the state could be captured at the first point.¹ Secondly, a road permit is used to import goods into the state.² The road permit is sent by the importing dealer to his counterpart in another state prior to the import of goods. The trucks bringing goods into the state are expected to carry back these permits for scrutiny and verification at the checkpoints. One copy of the road permit is then sent by the checkpoint to the concerned assessing officer. In principle, this system should ensure that all the major imports would be accounted for and hence tax is paid on them.³

To ensure that the earlier dealers in the last-point tax and the subsequent dealers in the first-point tax are not selling commodities which are not "tax-paid", the procedure requires issue of declaration forms. In the case of the first-point tax, the selling dealer issues declaration forms which testify that the tax has been previously paid on the goods sold. Those goods in respect of whose purchases, declaration forms are produced, are deemed to have already suffered tax and the concerned purchasers need not collect and pay tax on them. Likewise, in the case of the last-point tax, the purchasing dealer issues a declaration form stating that he is buying the goods for resale. The difference between the procedures of the first-point tax and that of the last-point tax is that whereas

in the former case the declaration forms are to be checked against purchases, in the latter case, the declarations are to be verified against sales to a particular dealer. In addition, the verification of the road permits against the returns of different dealers needs to be done meticulously.

Trends in Registration of Dealers:

The registered dealer is the cornerstone of sales tax administration. The total number of such dealers in India is estimated at three million.⁴ This includes approximately one-third of the dealers who are registered under the central sales tax.⁵ The number of registered dealers has increased by about one million during the last one decade. The distribution of these dealers is uneven among states. Five states, viz, Andhra Pradesh, Gujarat, Maharashtra, Tamil Nadu and Uttar Pradesh account for more than half of the registered dealers. The other states which have about one-third of the dealers include, Karnataka, Kerala, Madhya Pradesh, Punjab Rajasthan and West Bengal. The remaining 13 states together account for only one-sixth of the total registered dealers. The variation in number is explained by (i) the level of economic development, (ii) variations in the composition of trade and industrial structure and (iii) divergence in the exemption limit prescribed by different states.

Exemption Limit:

Different states prescribe varying turnover limits for registration of dealers. This limit, known as the exemption limit (or the taxable quantum), shows that most of the states kept this at a very low level in 70s. Gradually, the levels were raised according to increases in prices and incomes which led to higher turnovers. However, in some of the states the exemption limit continues to be extremely low. For example, Andhra Pradesh has no exemption limit, Manipur has an exemption limit of Rs 5,000 and Assam of Rs 20,000.

An overview of the composition of registered dealers and payment of tax by them reveals that a large number of small dealers pay a very small proportion of total revenue to the government. Most of the revenue is collected from a small fraction of total dealers falling in the higher turnover groups. The estimated average of all-states shows that 62.27 per cent of the revenue is collected from the dealers having gross turnover of over Rs 5 million. These dealers are just 2.1 per cent of the total registered dealers in the country. On the contrary, and more importantly, the dealers falling in the gross turnover category below Rs 50,000 are very large in number (68.4 per cent of the total) but pay a negligible amount of tax (6.5 per cent). Because of their sheer number, departmental work is disproportionately large in relation to their inconsequential contribu-

tion to the exchequer. This tantamount to frittering away precious manpower in an expensive exercise. In the interest of efficiency in administering the tax, it is therefore, important that the present exemption limit is raised to a higher level of Rs 1 lakh.

However, the treatment of the manufacturers and importers has to be different. Whether the tax be the first or the last-point, the transactions can be traced to their origin either through the manufacturer or through the importer. If the department could verify the sales and purchases through these dealers, evasion of tax could be avoided without any problem. Consequently, most of the states require these categories to be registered at a very low exemption level or without regard to any turnover level. This practice needs to be continued irrespective of its effect on the number of dealers under the tax net.

Registration Procedures:

As the number of registered dealers is crucial to an efficient tax administration, the procedure of registration is critical to the efficient tax enforcement. The existing procedure for registration requires the dealers to submit an application in a prescribed form (containing details about the business of the dealer) to the sales tax officer concerned. The officer in turn verifies the identity of the dealer, his source of a livelihood before commencement of the business, his financial position and his local and permanent address. In other words, the officer concerned is required to establish the bona fide of the dealer. However, it is noticed that in most states the registration certificate is issued without proper verification. Hence, the existing registration procedure, however transparent, is not conducive to efficient tax enforcement. Lack of careful verification of the bona fide of the applicant dealer allows fictitious dealers to crop up.⁶

Processing of Returns and Payment of Tax:

Registered dealers in general are required to submit quarterly returns and pay admitted tax on a quarterly basis along with the returns. Many of the states require that the dealer having a tax liability of Rs 2,500 per month or more should pay tax on a monthly basis along with a monthly return. The procedure for payment of tax requires filling in of the challan-form in quadruplicate. When the challan is submitted to the treasury, the third and fourth copies duly endorsed for payment are returned to the dealer. The 'original' copy is sent to the respective assessing authority while the duplicate copy is retained by the treasury. The dealer submits the copy marked 'quadruplicate' along with the return to the assessing authority. The return form at present in most states runs into a few pages. In addition, in many of the states the dealers are required to append

information on transactions of purchases and sales.

Assessments and Number of Authorities:

Assessment procedure commences after the receipt of all the returns. If the return is found correct, the assessing authority may accept it without calling for the dealer but if the return filed is not found proper, a notice is issued to the dealer to be present before the assessing authority to explain the disputable aspects. In practice, almost every dealer is called by the assessing authority. The assessing authority may adopt the 'best judgment assessment' after issuing the required notice, if the assessee does not comply with the requirements.

The trend in assessments shows that the number of assessments has been increasing over the years. While the trend in assessments among different states indicate a growth rate in the range of 1.3 per cent (in Karnataka) to 9.01 per cent (in Andhra Pradesh), the majority of the states have growth rates varying between three and five per cent.

The number of assessments is directly related to the number of registered dealer⁷ and, as is evident from the prevailing trend that the increase in the number of assessments over the years has not been commensurate with the increase in the number of registrations. Owing to the backlog in assessments there has been an increase in the arrears of assessments over the years. The cumulative effect of the pending assessments has been startling. Whereas, the pendency of assessments as percentage of number of registered dealers is as low as 5 to 6 per cent in Andhra Pradesh, it is as high as 90 to 95 per cent in West Bengal. In fact, in most of the states, it is between 30 and 50 per cent.

Trends in Appeals:

The trend of appeals instituted over a period of time shows wide variations among the states. Thus, the proportion of number of appeals to the number of assessments varies among states. Whereas this proportion ranges between 1 and 6 per cent in most of the states, in a few states this proportion shoots too high (25 to 30 per cent).

The trend in the institution of appeals reflects on the quality of assessment as well as on the administrative procedures. The obvious inference is that the larger the proportion of appeals instituted to the number of assessments, the worse is the quality of assessments or the administrative procedure. Some of the defects generally found are: (a) the penalties by the assessing authorities in many cases are more than warranted, (b) the 'best-judgment assessment' in most cases is not acceptable inasmuch as the deductions are not allowed for, (c) the assessing authorities at times commit proce-

dural mistakes, and (d) the fee for appeal is quite meagre. It is, therefore, important to examine the causes of appeals and their remedies.

Arrears in Sales Tax Collection:

Arrears of sales tax have been rising steeply over time in many of the states. The major part of the arrears relates to the general sales tax (GST). Arrears at the beginning of the year, as percentage of the total sales tax collection, amounted to approximately 5 to 10 per cent in many of the states. Another aspect of the arrears relates to the period for which they have been outstanding. In many of the states, one-fourth of the arrears relate to the earlier years.

Under the existing procedures, sales tax arrears are to be recovered as arrears of land revenue. However, in many of the states, the situation has been modified. The commercial tax departments have been entrusted with the work of recovery. These departments have consequently appointed sales tax recovery officers and the experiences of these departments have proved encouraging.

Cost of Collection:

The cost of sales tax administration is crucial to the efficiency of the department. However, the estimates of cost of collection⁸ of sales tax, show that in many of the states the cost varies between 1 and 6 per cent of sales tax revenue. Higher cost of collection in some of the states, like Maharashtra, is due to the strengthening of the anti evasion activities of the department but in states like Nagaland it is owing to the administration being at the initial stages of development.

III

Reform in Sales Tax Management

The analysis of organisation and the operation of sales tax presented above suggests that broadly speaking, the sales tax department, as any other tax department, performs two types of activities, viz. the functional and the institutional. While the former is performed to fulfil the purposes for which the department exists, the latter refer to the type of activities the department must concern itself with, in order to enable it to serve as a department. In fact, the institutional activities relate to the pattern of internal organisation that can directly contribute to success in the execution of the primary or the functional activities of the department. A proper and effective performance of these activities is, therefore, crucial to an efficient working of the organisation. With a view to performing both these activities efficiently, it is important to carry out some reforms in the administrative organisation as well as operation of the tax. In this section, therefore, we shall present such reforms.

NEW ECONOMIC POLICY AND THE VULNERABLE SECTIONS

DR. PRADEEP BHARGAWA (ED) *Institute of Development Studies, Jaipur*
ISBN : 81-7193-060-3 (HB) Rs. 226/-

The book is a collection of articles on the New Economic Policy and its impact on vulnerable sections. The articles debate on the rationale and the imperative to change the economic policies and how the vulnerable sections are likely to be affected by accelerated growth as well as expected changes in the composition of growth. The articles explore the rationale for public interventions in favour of vulnerable sections, the strategy to be adopted and the design of such programmes, particularly how basic education and health services could be made more cost effective and more target oriented.

MINIMUM WAGES IN GOVERNMENT SPONSORED RURAL EMPLOYMENT PROGRAMMES

DR. DEEPAK GIANCHANDANI (ED) *Institute of Development Studies, Jaipur*
ISBN : 81-7193-024-7 (HB) Rs. 100/-

One of the important welfare measures taken by the State in favour of the disadvantaged sections is the institution and implementation of Minimum Wages. There has always been some controversy about the impact of minimum wages on the labour market. The consensus of opinion in the developing countries is veering around the view that where the market imperfections are rampant and interlocking of markets not very uncommon, state intervention in terms of the declaration of minimum wages helps in rationalising market processes.

A strong movement was launched by the workers on the famine relief type activities in the state, some of these covered by the Jawahar Rozgar Yojana, to obtain minimum wages.

FERTILIZER PRICING : Issues Related to Subsidies

DR. VIDYA SAGAR (ED.) *Institute of Development Studies, Jaipur*
ISBN : 81-7193-032-8 (HB) Rs. 218/-

The book is a collection of articles dealing with different issues related to fertilizer pricing and subsidies. The debate generated by the increase in fertilizer prices as emerging from the Stabilization phase of New Economic Policy forms the back drop of this collection.

Starting with a global fertilizer perspective in fertilizer pricing policies, the discussions trace the history and factors behind the rapid growth in fertilizer subsidies. While there is scope for a reduction in retention price by improving the efficiency of the fertilizer industry and the fertilizer distribution network, a healthy growth needs reasonable returns on its investment.

The burden of reducing subsidies, therefore, has to be borne by the farm sector and consumer of agricultural produce. The fear of decline in rate of growth of fertilizer consumption is not likely to be true if this is gradually done. However, the state on its part must continue to target its efforts for the weaker sections of farmers and consumers of agricultural produce.

Registration of Dealers:

With a view to checking the entrance of bogus dealers, it is essential that the department undertakes a proper scrutiny of the dealers prior to their registration and only genuine dealers are able to procure the registration certificate. In this regard the procedure followed in the past by West Bengal is worth emulating. In this state, a special circle of the enforcement wing was created to carry out verification of the bona fide of the applicant dealer. This verification was in addition to the usual check by the office of the assessing authority. The registration certificate was issued to the dealer only when both the agencies, namely, the office of the assessing authority and that the special circle of the enforcement wing recommended it. Such arrangements are important to check the entry of bogus dealers into the stream of registered dealers.

Another procedural reform in the issue of a registration certificate relates to making sure that the dealer is certainly a bona fide one. For this purpose it is useful to ask the applicant dealer to produce a security bond as well as two good references. The bond could be of an amount of Rs 50,000 in the case of an individual proprietor and Rs 1,00,000 in the case of a partnership firm or a company. After the dealer establishes his bona fide to the satisfaction of the department, the condition of the bond may be waived.

Smooth Processing of Returns and Payment of Tax:

While recognising the fact that the requirements of monthly/quarterly advance payments are designed to ensure an even flow of resources into the treasuries throughout the year, it cannot be ignored that these provisions do cause difficulties to the dealers. With a view to minimising hardship, the following procedural reforms could be attempted: First, the monthly return and payment of advance taxes should be required for only those dealers whose tax liability per month exceeds Rs 5,000. Secondly, the monthly return should be a simple statement containing the registration number of the dealer, his name and address and the amount of tax paid. Finally, a combined return-cum-challan form should be adopted in place of the existing separate quarterly return form and challan in quadruplicate.⁹ All that the assessee has to do is to take the combined form to the treasury, make the payment, and obtain the return and one copy of the challan duly endorsed.¹⁰ He can keep one copy of the challan himself and submit the receipted return form to the assessing authority.¹¹

The procedure outlined above is much simpler than what the assessee is called upon to do now in many of the states. To further simplify matters, the proposed quarterly

return-cum-challan should provide for eliciting from the dealer information only on the value of total purchases, gross turnover, exemptions, net turnover and tax paid.¹²

Prompt and Proper Assessment:

The increasing arrears in assessment over the years and normal delays in assessment are a function of the number of assessing authorities and the involved procedures for assessments. As regards the number of assessing authorities, the increase has not been commensurate with the growth in the number of registered dealers. Accordingly, the number of registered dealers per assessing authority has been increasing over the years.

As regards procedure of assessment, there are two important lacunae. First, in many of the states, there is no legal binding on the department to complete the assessment of a dealer within a specified period. Thus, theoretically, an assessment could be postponed for any number of years. Such a state of affairs requires the dealers to preserve accounting records pertaining to several years. It is, therefore, necessary that there should be legal binding on the department to assess dealers within a specified period. Some states provide for such a limit of four to six years. This is a very long period from the point of both the dealers and the administration. Like the existing provisions under the income tax laws, this limit must be reduced to two years only. Secondly, the present practice of assessment is to call all the dealers liable to pay tax to the sales tax office. They are asked to bring their books of accounts and all other necessary documents. On submission of all the books of accounts the assessing authority verifies the accounts and the other relevant documents. It is, however, important to recognise that such verification and checking of the documents cannot be justifiably done for every dealer. It is essential to adopt different procedures with regard to small and large dealers. In this context, dealers with turnover of Rs 2,00,000 may be considered as small dealers [Government of India 1980] and a scheme for self-assessment be practised in these cases.¹³ In fact, some of the states have already gone in for this type of scheme but standardisation of such a scheme would be useful [Chelliah and Purohit 1981].¹⁴

While adopting the scheme of self-assessment, it is important to discourage attempts of the dealers to indulge in evasion of tax. This could be done by instilling in their minds awareness of the possibility of a random check by the assessing authorities. For this purpose, there should be a 1 per cent sample check of the accounts of the small dealers every year. Dealers falling in the sample category should be called to the office of the assessing authority and their

accounts are checked as thoroughly as those of the big dealers. It must be stressed that to minimise harassment and victimisation, samples should be chosen by the commissioner or his representative.

As regards large dealers, their accounts of sales and purchases have to be checked thoroughly. All documents such as purchase vouchers, cash memos, declaration forms and permits must be verified. For verifying the accounts as well as documents the assessing authority has to work expeditiously. However, it is found that the work relating to verification of documents (especially the declaration forms claiming exemption from tax and the documents received from the checkposts) is done only cursorily.

Experience shows that there are three factors responsible for such cursory checking. First, the number of assessing authorities assigned to complete the task is too small. This is corroborated from the fact that in most states, 98 per cent of the revenue is collected from admitted tax. Secondly, the assessing authorities in most states are either from the Finance Services or State Administration Services. In some states there is direct recruitment to the posts. Notwithstanding the different methods followed in the states, half of the assessing authorities are those who have risen through promotion from the lower ranks. Thus, the amount of training given to these officers leaves much to be desired. And, thirdly, there is no division of work in relation to administration and assessment. It is felt that the assessing authorities are normally pre-occupied with the administrative work relating to registration, market surveys, inspection, and issuing of certificates or other documents. Hence, they are not left with enough time to do justice to the assessment work.

The general experience of working of sales tax authorities in India suggests that the sales tax administration needs to adopt a new strategy for assessment. Apart from a sample check of 1 per cent of the small dealers, the assessment of very large dealers having turnover of Rs 5 million and above should be entrusted to qualified chartered accountants. This would mean hiring of such personnel by the department. These departmentally hired accountants would not be less qualified than those who prepare the accounts of the large companies. Hence, there would be greater chance of proper checking of accounts than what exists today.

More importantly, assessment of all the dealers (liable to be assessed) must be completed every year. As the evasion of tax is caused due to delay in assessment, it is essential that the assessment of the dealers is attempted in the year of filing the return. This would check the 'bogus dealers' getting into the system and would slowly 'throw' them out of the system.

Reorganising Enforcement Wing:

Tax evasion is indicative of lacunae in the administration of sales tax in India. It is felt that widespread¹⁵ evasion results in serious consequences for the tax system of the country. Apart from the fact that the tax yield becomes smaller and uncertain, the principle of equity in the tax system is also frustrated. Serious tax discrimination is introduced among enterprises taking part in the same competitive process. This affects the elasticity of conscience of the honest tax payers and ultimately increases tax evasion. Consequently, the effective rate of tax is reduced considerably and the nominal rates of tax are established at a much higher level. This further increases the unfairness in taxation, to the disadvantage of the tax payers who are either honest or unable to evade tax and, therefore, pay full tax.

The most important reform for checking evasion of tax is to strengthen the existing enforcement organisation. An organisational problem concerning this wing relates to police assistance. This is important in cases of search and seizure, attempting prosecution, and in the smooth working of the roving squads. As the existing enforcement wing does not have any assistance from the police within the department, it has to depend upon the police personnel who are neither properly trained in tax matters, nor take the tax matters in the same spirit as the staff of the enforcement wing does. In this regard the experience of the West Bengal government is worth emulating where the bureau of investigation has been provided with a police wing headed by a deputy inspector general of police (DIG). The police personnel help the bureau officials as and when required and conduct the prosecution cases under Indian Penal Code (IPC) and/or IPC/CrPC, as referred to them by the bureau of investigation.¹⁶ Keeping in view the experience of West Bengal, it is important that the enforcement wing should be reorganised in all the states to have an adjunctive police wing. The police wing should be headed by a man of the rank of DIG. But the work of the wing should be under the control of the CCT. All the police personnel deputed to the wing and working under the DIG should be specially trained to take up tax matters before they are sent to the enforcement wing. They should, however, continue to be in the police department for the purpose of their service career. This would strengthen the enforcement work.

Strengthening of Border Checkposts:

Another reform in administrative organisation is related to border checkposts. Although these checkposts play an important role, the manner of their working leaves much to be desired. First, operational facilities (such as weigh bridges, godowns, loadmen, telephone and even requisite fur-

niture) are conspicuous by their absence at most of the checkposts. Secondly, no facilities are available either for the officers working at the checkposts or for their families. And finally, the checkposts are not even housed properly; many of them are functioning in thatched sheds.¹⁷ Owing to such working arrangements the checkposts do not perform their jobs efficaciously. In fact, in most of the cases, hardly 5 per cent of the vehicles are checked and these too only cursorily. A visit to the checkposts presents a thoroughly disgusting scene: the vehicles are parked in a haphazard way, mostly blocking the vehicular flow and that too far away from the checkposts. The documents of the goods are submitted by the cleaner or other attendants. These documents are accepted without any verification. It would be a Herculean task to check all the vehicles, yet the present manner of checking is so cursory that it does not seem to serve any useful purpose.

In practice, it has been found that the system does not work as effectively as it is intended to. For one thing, the documents received from the checkposts being very large in number, the enforcement wing finds it virtually impossible to get even the majority of the transactions cross-checked. Secondly, the documents are not despatched promptly by the checkposts. In many cases it is found that at any particular time a substantial volume of documents is awaiting despatch for a long time for want of postage stamps. Such delays tend to defeat the very purpose of collection of information through checkposts.¹⁸ Finally, it is learnt from various states that at the time of assessment the documents received from the checkposts are not used effectively for cross-checking the returns because they are too voluminous.¹⁹

In order to eliminate the above deficiencies, it is important that the checkposts be properly staffed. Each checkpost should be in the charge of an officer of the rank of a CTO. Important checkposts should be manned by senior officers of the rank of AC supported by CTOs and ACTOs. In addition, each checkpost should have sufficient supporting staff of loadmen, as well as policemen. Other facilities such as residential quarters, godowns, weigh bridges and public telephone booths are crucial to the proper maintenance of the checkposts.²⁰ Finally, proper arrangements of the personnel should be done to enable the checkpost officials to send requisite information to the computer centre without any delay. This is crucial to the management information system for the tax administration.

Abolition of Internal Checkposts:

Although the importance of checkposts is to monitor the flow of goods into the state, the sales tax departments, in their zeal to

check evasion of tax, have created checkposts not only at the state borders but have surrounded a large number of towns with their virtual ring through checkposts. Such posts, normally known as internal checkposts, cannot be said to serve the purpose of monitoring the flow of goods into the state. They interfere with the flow of trade and traffic within a state and cause harassment to a large body of dealers, the majority of whom are not liable to pay tax. The existence of such checkposts does not contribute significantly to the checking of tax evasion. On the contrary, larger the number of checkposts, more is the waste arising from the stoppage of traffic. Even a conservative estimate shows that the money value of the loss of time suffered by the transporters due to checkposts are tremendous [Purohit 1986b]. However, the monetary loss of time suffered by the transporters due to the external checkposts is much less as compared to the loss caused by the internal checkposts.

It hardly needs pointing out that the operation of a large number of checkposts in a federation interferes with the free movement of goods within a country. More so, the existence of a larger number of internal checkposts within the state causes harassment to the business community. In fact, the administrators as well as the policy-makers generally agree that the checkposts are a source of corruption. Hence, it is a sound policy to keep their number down to the minimum. And, to begin with, all the internal checkposts must be abolished.

Reorganising the Appellate Wing:

The appellate organisation of the department is generally under the supervision of the CCT. In most of the states the first appeal is heard by the DCCT or the JCCT. However, it has been found that this person is concurrently having jurisdiction over the administration as well. In other words, the appellate work at this level is in effect under the supervision of the CCT. This, in principle, is objectionable. Any agency which is under the direct control of the CCT should not be vested with jurisdiction to hear appeals from the orders of the assessing authorities such as CTO. Justice should not only be done, but should also appear to be done and inspire confidence in the persons concerned. Issue of "orders, instructions or directions" is not the only form in which influence may be brought to bear on the judicial mind. The public is entitled to assume that the appellate authorities feel the pulse, and work according to the wishes of the department, and hesitate before taking a view which may not be palatable to the department [Government of India 1960]. It is, therefore, necessary that the appellate authority [i.e., the DCCT (appeals) or the JCCT (appeals)] should not be kept under the superintendence of the CCT. In this

regard it is suggested that a Tribunal on the lines suggested by the Taxation Enquiry Commission 1953-54 [Government of India 1955] be constituted. The Tribunal should consist of senior persons having judicial, accountancy and business experience. These changes may ultimately reduce the number of revision petitions by inspiring confidence in the minds of the public.

Also, it is seen that in most states, there is no time limit for the exercise of *suo motu* revision²¹ by the commissioner. This requires the dealer to maintain books of accounts for an indefinite period of time. In the interest of an efficient administration, a time limit of two years must be imposed.²²

Introducing MIS for Sales Tax:

Apart from the organisational reforms suggested above, it is also important to note that the commercial tax department has not so far built-up a proper information system. It has been observed that data collection in most departments is not properly done. At the headquarters organisation there is a statistical unit called the research and statistical wing but it is not properly manned or manned by untrained personnel. This does not help the department to have a proper information system. For this purpose, it should have an appropriate information base to cover all major aspects of tax administration. An information base of such a dimension is possible with the help of management information system (MIS), a recent advancement in computer technology. The MIS is designed to provide management with integrated, all-encompassing information on the working of the total organisation in order to facilitate the decision-making process. The MIS has interrelated sub-systems and built-in capability to transfer data between systems. The result is an output that provides management with meaningful data for effective controlling and administering of departmental policies.

Although the states have made a beginning in having an information system it is important to reform the system on the lines suggested below [Purohit 1986a].

First, it is essential for building up of the MIS that the data collection system and related systems of conducting surveys, etc., are brought under the control of an authority such as the deputy commissioner, research and statistics.

Secondly, it is important to have structural changes at the headquarters organisation relating to the research and statistics wing. This wing exists in many states but in most cases it is either unmanned or manned by untrained personnel. As the information system is becoming increasingly important, a research and statistics wing must be provided for in each state. It should be manned by a senior official from the department, and

support staff should include a fully-trained statistician. It is proposed that this person could be taken on deputation from the Directorate of Economics and Statistics in the state concerned.

Thirdly, it is important to make some changes in the system of documentation. For example, an interaction between the unit office where a quarterly return is submitted and the computer centre where data could be called from the return is necessary. For this purpose, a revised quarterly return should be introduced. A comprehensive annual return should be introduced to enable the department to obtain the requisite information.

Fourthly, cross verification of documents received at the checkposts is of utmost importance. Some of the states have already started a step further in this direction. For example, Karnataka prepares statements of documents giving receipts or despatches of the dealer. These statements are sent to the concerned assessing officer in the district. However, it is important that the computer be put to further use of cross-verification of all these receipts and despatches against the records available from the dealer.

Fifthly, in addition to collecting statistics from the returns and the related documents received from the checkposts, it is important to collect some information after the assessments have been completed. To collect such information a new proforma should be devised. This should be sent by the unit office to the computer centre giving further details about the assessment of a dealer as and when the assessment is completed. This should include information about assessed gross turnover, assessed taxable turnover, assessed tax, the year in which the assessment was made, information about reopening of the case and any other relevant information about appeals and appeal effects.

Finally, registration of dealers being the very foundation of the sales tax administration, it is important to consider the dealer as the basic unit for analysing tax data. Therefore, a Master File should be prepared in the computer for each dealer.

Training and Recruitment:

Another reform should be in the area of training and recruitment of the departmental personnel. The officers of the commercial tax department are generally drawn from State Finance Services. In some of the states even this service is not in existence. Where the recruitment is done through this service, the candidates are taken through direct recruitment as well as promotion; the proportion of the two is roughly equal. When a fresh recruit to a State Finance Services comes to the department, he is taken at the level of an ACTO. On passing a departmental examination conducted by the Board of

Revenue or any such authority, the ACTO is promoted to the rank of a CTO.

At no stage of recruitment or promotions, these officers are sent for training for the work they are required to do for the assessment of the taxes. In some of the states these persons do not belong to the tax department at all and the position is really pitiable for these persons who can go to any department within a period of two to three years. It is, therefore, of paramount importance that those who are posted to the commercial tax department are imparted proper training in the beginning of their career. The state should think of having well-trained personnel of taxation services in the states. By creation of such services it is possible to bring out a substantial improvement in the administration. It is not to suggest that those who are taken to the taxation should not be eligible to serve in any other department of the government from time to time but in order to have a scientifically managed modern tax system, it is necessary to have a distinct cadre which can accumulate experience and knowledge through specialisation in the field of taxation.

The training now given to the officers directly recruited in the finance service system of the state is absolutely inadequate. The course is for too short a period and there is not much of the economics or the accountancy in the course contents. It is important that the new recruits earmarked for the Taxation Services be given intensive training for a period of not less than six months. The proposed training programme should cover economics of taxation, systems of accounts, financial rules, tax laws and tax administration. The training should aim to enable the officer to understand the intricacies of assessment procedures laid down, and legal problems that have arisen or likely to arise in relation to the tax system.

Advisory Committees:

Finally, it is important to have an advisory committee at the state level for proper administration of the tax. Although in most of the states such committees do exist, these are not truly functional committees. The committee comprises political representatives, legal experts, business and trade representatives and the government officials. The committee is headed by the finance minister of the state. With this structure, the advisory committee should have been a very useful platform for the discussion of the problems related to both the structure and the operation of sales tax in the state. The effectiveness of the committee has, however, been weakened by the fact that the recommendations of the advisory committee are forwarded to the government without any empirical support. Since the government have rarely acted on any of the recommendations of the advisory committee

under the apprehension of losing revenue, the importance of the committee has slowly come down. With a view to strengthening these committees, it is recommended that the advisory committee should send the recommendations after empirically getting it tested through the research wing of the department.

CONCLUSION

The above analysis of the organisation for sales tax administration and of the operation of tax indicates that due attention has so far not been given to the crucial role played by these managerial aspects. Over the years there is an increasing realisation that in practice the administration is the law. Whatever rationale the structure of the tax may be, its real impact would depend upon how it is implemented. In view of the given sales tax management in the country, a thorough reorganisation of the administrative organisation as well as the operations for the sales tax in the country on the lines discussed above would not only help the sales tax department to comply with its functional activities but will enable it to fulfil its institutional functions. It is high time that we strengthen our sales tax management to enable the administration to pave way for the adoption of state-VAT to replace sales tax.

Notes

[This is a revised version of a paper submitted to the International Conference on 'Current Issues in Tax Administration' held on April 7-8, 1994 at the University of New Castle, Australia.]

- 1 Instead of covering all importers and manufacturers, some states, for the sake of convenience, provide for a low exemption level. That is, the importers and manufacturers above a particular turnover are required to be registered with the department.
- 2 Under this system the intending importers are required to furnish details of goods to be imported and on application by him a permit would be issued, copies of which could be carried by the truck operators who would be bringing the goods. The road permit contains information on the nature, quantity and value of goods to be imported.
- 3 This system prevails in many of the states. In some of the states the permit is restricted to select commodities only.
- 4 While computing this information some estimates have been made by extrapolating data for some of the states. Further, this information relates to all the states but includes Union Territory of Delhi which has about 4 per cent of the total dealers in the country. The other territories have an inconsequential number of registered dealers. For details see Purohit (1995).
- 5 As most of these dealers are also believed to be registered under the States' Sales Tax Act, the total number of dealers cannot be ascertained with exactness.

- 6 One of the methods of evasion of tax referred to as Bill Trading or Hawale Trading is practised through fictitious dealers. This would be avoided by a thorough check of the bona fide of the dealers.
- 7 In some states like Assam, the assessment is done twice a year. This causes the number of assessments to be much more than the number of registered dealers in the state. The practice of two assessments in a year is, however, of no use. It increases the workload of the department without any specific advantage for the administration. See for details Chelliah and Purohit (1978).
- 8 The available cost estimates are not exact. As most of the states administer a number of other commercial taxes, any calculation of the accurate cost of administration for sales tax alone is arbitrary.
- 9 A combined form of this kind has already been introduced in Maharashtra. In such a form there are two copies of the challan divided by a perforated line and at the bottom of the return there is place for the treasury to make an entry regarding payment of tax quoting the challan number.
- 10 This procedure could be eliminated for the convenience of the dealer if the payment is allowed to be made through cheques.
- 11 On the basis of the receipt of this information, the assessing authority would be able to help the computer centre maintain up-to-date records.
- 12 Maharashtra has introduced this return but it asks for too many details. Such details need not be asked for in the quarterly return.
- 13 One of the suggestions in regard to differential treatment of small dealers is to provide for compounding of tax liability. In fact, in many states, there are rules providing for a lumpsum tax to be paid by a small dealer until he attains a particular higher level of turnover than the exemption limit. This is, however, not the right way to help small dealers. If a dealer collects tax from the consumers, he should pay the amount in full to the government. But when the provision of compounding is accepted the dealer collects the tax but pays only an approximate amount of the collection. That is, he pays either more or less than what he actually collects [see Purohit 1975].
- 14 The scheme of small dealers should be carried on the basis of *Forfait scheme*, as followed by France. See for details Purohit (1993).
- 15 Various studies undertaken to estimate the evasion of sales tax suggest that it varies from state to state and from one commodity to another. The variation of estimates of evasion is from 5 per cent of the potential revenue to 85 per cent of the same. See Purohit (1995).
- 16 Similar help is available to the enforcement wing in Punjab where the commissioner administers state excises as well. The police help is available because of the state excise and not owing to the administration of sales tax. It is, therefore, important that in most of the states where state excise department is independent of sales tax, police assistance is provided to the sales tax department.
- 17 In Tamil Nadu, for example, 62 per cent of the checkpoints are housed in thatched sheds.
- 18 Some of the states, such as Uttar Pradesh,

have made arrangements for delivery of all documents every week through manual mechanism. The documents are put in envelope as per districts and manually sent to the divisional headquarters and then distributed to the respective districts. Hence the documents do reach the officers and to the file.

- 19 It does not seem proper to burden the enforcement wing with the task of cross-verification of the documents received from the checkpoints, as they have more important work to do.
- 20 The weigh bridges in states like Gujarat have been privatised and are in very efficient working condition. These bridges are extremely useful in having an estimate of the type of goods being carried by the trucks.
- 21 *Suo motu* powers refer to the power of the commissioner of reopening the assessment order which may be prejudicial to tax revenue.
- 22 Under the Income Tax Act, the commissioner can exercise *suo motu* powers for two years from the date of the orders sought to be revised.

Indian Social Scientists and Critique of Secularism

Joseph Tharamangalam

In this paper the arguments of three critics of secularism – T N Madan, Ashis Nandy, and M N Srinivas – are examined, as well as their implications for India's pluralist society.

A GROWING number of social scientists in India are joining the debate about Indian secularism.¹ Mainstream social science has continued to defend secularism especially in the face of the threat posed by increasing communal politics and religious strife. But a small and apparently growing group of social scientists have called for a re-examination of Indian secularism, arguing that secularism may be the cause of, rather than the solution to, India's crisis. Critics such as Ashis Nandy and T N Madan reject secularism as radically alien to Indian culture and tradition and advocate a return to genuine religion and the indigenous traditions of religious tolerance as the best means to preserve and maintain a pluralist and multi-religious Indian society. Their ranks have recently been joined by the distinguished Indian sociologist M N Srinivas, who has called for a renewal of faith in god as saviour in order to meet India's cultural crisis. The objective of this paper is to critically examine the arguments of these writers and to assess their validity as well as their implications for the maintenance and defence of India's pluralist and multi-religious society, culture and polity.

DEFINITIONS

There is considerable confusion resulting from the bewildering variety of meanings that have been attached to the concepts of secular, secularisation and secularism. The concept of secularism is now so deeply entrenched in Indian academic, political and legal-constitutional discourse that it is necessary to clarify this and other related concepts. At least since the time of Durkheim, sociologists have recognised a universal distinction between the sacred and the secular. The sacred refers to a realm of reality that is mysterious, awe-inspiring, forbidden and set apart from the ordinary. This is the realm of god and religion. The secular or profane, on the other hand, refers to the realm of the mundane, work-a-day world. Mystical and cosmic religions, especially in the east, have sought ultimate knowledge and holistic experience that would resolve the dichotomy between the two domains and reveal the underlying unity of the One. It is very doubtful that such ideas affected the lives of ordinary

people greatly since people everywhere not only distinguished between the two domains, but used different means and technologies to deal with and to control the two worlds, using, for the most part, empirical means for mundane activities such as hunting, fishing and agriculture needed to satisfy their basic needs of subsistence. In any case, modern secular society stands at the other end of the continuum in separating the two spheres to a large extent banishing the realm of the sacred to the 'private' sphere. Although there is a wide range between the two extremes, nowhere do the mystics completely ignore the logic or laws of the empirical, secular world, and nowhere have the secularists succeeded in reducing the sacred entirely to the secular realm. It can be seen that both the distinction and the separation between the religious and the secular is universal although the degree of the separation varies very widely.

Secularisation is a concept used to refer to a multi-dimensional historical process generally associated with modernity. Modernity brings in its wake several important processes of change. The most important of these are: (1) differentiation at the level of institutions, structures and functions resulting in the withdrawal of religion from such social spheres as education and marriage; (2) the development of pluralism at the level of social groups (including religion) and world-views resulting in the pluralisation and relativisation of the world; (3) rationalisation as described by Max Weber, which refers to the emergence of a scientific-rational world-view that was eventually expected to strip society of its myths, mystery, miracle and magic, thus making it 'disenchanted'; and (4) the development of a critical consciousness that reveals the ideologies hidden in the institutional and belief structures of religion. The noted American sociologist of religion, Peter Berger, defines secularisation as a process: "in which religion loses its hold on the level both of institutions and of human consciousness" (1969: 107) and, in a later essay, as "the process by which sectors of society and culture are removed from the domination of religious institutions and symbols" (1980:24). Srinivas describes secularisation in India in a similar vein and

delineates some of its dimensions (1966:119).

Secularisation is not only a historical fact, however. It is also used to refer to a theory that attempts to describe the invariant relations in this process and to predict its direction. From Comte to Max Weber to more recent writers such as Bryan Wilson and Peter Berger, theorists of secularisation have engaged in debates about its universality, irreversibility and its progressive encapsulation of societies.

MODELS OF SECULARISM

Secularism is both a model of society and an ideology and, especially in the Indian context, has come to mean all things to all people. Broadly we can describe the following conceptions or models as ideal types of secularism in India.

1 The Official Indian (Nehruvian) Model

India is formally a secular democratic state. The Indian Constitution spelt out in several articles the main provisions regarding the secular state even before the term secularism was introduced into in 1976 [Smith 1963]. First, it guarantees freedom of religion to individuals as well as to religions (to "every religious denomination or any section thereof"). Second, it guarantees equality of citizenship, that is, no discrimination on grounds of religion (Art 15.1), equality of opportunity in public employment (Art 16.1.2), no discrimination in educational institutions (Art 29.2), and no communal electorates (Art 325), although there is special provision for reservation of seats for scheduled castes and scheduled tribes (Art 330.1 and 332.1). Third, it provides for separation of state and religion, that is, no special taxes for promotion of religion (Art 27) and no religious instruction in state educational institutions (Art 28.1.2.3). It is clear that the intention of the Constitution is neither to oppose religion nor to promote a rationalisation of culture, but merely to maintain the neutrality and impartiality of the state in matters of religion.²

This model of secularism is premised on at least a certain degree of secularisation of civil society, in the sense of disassociation between religion and society and the

relegation of religion, if not entirely into the private sphere, at least into some very limited domains of public life.

Secularism in this sense is also seen as a protector of minority rights. It is instructive that minorities in India, despite being intensely religious and sometimes even fundamentalist, are among the most ardent supporters of secularism, from which they primarily expect the impartiality and neutrality of the state. The alternative, as they see it, is Hindu domination of society, if not an outright Hindu theocratic state. Thus "...if secularism denotes only that a secular state should not be partisan in matters of religion, it is believed to be in accord with Islamic tradition which gives freedom to every citizen" [Haaqq 1971:47].

2. The Traditional Hindu Model

Many Indian intellectuals and leaders in India, especially Hindus, see secularism, by and large, in terms of the ancient Hindu ideas of religious tolerance and equality of all religions. The speeches and writings of these men abound in pious pronouncements to this effect. For instance, Radhakrishnan wrote in 1955: "It may appear somewhat strange that our government should be a secular one while our culture is rooted in spiritual values. Secularism here does not mean irreligion or atheism or even stress on material comforts. It proclaims that it lays stress on the universality of spiritual values which may be attained by a variety of ways... This (the unity of spiritual experience despite doctrinal differences) is the meaning of a secular conception of the state though it is not generally understood" [Smith 1963: 147]. In another context he (1940:316) stressed that the "...Hindu view is not motivated by any consideration of political expediency. It is bound up with its religion." It seems that Gandhi's opposition to partition was also based on religious grounds [Smith 1963:149]. "Partition", he said, "means a portent untruth. My whole soul rebels against the idea that Hinduism and Islam represent two antagonistic cultures and doctrines. To assent to such a doctrine is for me denial of God. For I believe with my whole soul that the God of the Koran is also the God of the Gita, and that we are all, no matter by what name designated, children of God."

It will be readily admitted that this Hindu model has made a generally positive contribution to the evolution of a tolerant and liberal religious culture that informs the consciousness of vast numbers of people, Hindu and non-Hindu, in India. The metaphysical basis of this model of secularism is the transcendent unity of ultimate reality. The One that is beyond thought, word and manifestation, and not

bound by any particular book, prophet or incarnation, relativises all historically existing religions and paths to god. However, it is well known that in Hindu social thought not equality but hierarchy characterises the contingent world of the many, the world of historical pluralism. Hierarchy governs not only statuses, functions, rights and privileges, but also truths, values and spiritual planes, ethical ends and spiritual attainments, and even disgust and exclusion as exemplified by the principle of purity and pollution. The religion of the untouchable or the unenlightened with its idol worship and animal sacrifice is 'equal' to that of the enlightened sage only in the ultimate and transcendental order. If all this sounds like a description of the caste system, that is precisely the point, all religions are no more equal than all castes are equal. By the same logic a person must not change the religion into which he is born since that is 'appropriate to his status' and consequently should be sufficient for him.

It is not surprising that this model of pluralism (or secularism) has proven to be inadequate to meet the needs of a modern India that is struggling to create a democratic and egalitarian society. No viable model of secularism can be built on terms defined by any one religious group, even if it is 'the majority community', especially so since its mode of toleration has historically included absorption, subjugation and marginalisation of religious minorities.

3 Secularism as Anti-Religious Ideology

This model of secularism is a doctrinaire ideology which sees all religions as an anachronism in modern society, an epiphenomenon that belongs to the superstructure and a survival of the past that will wither away with economic development and scientific progress. Though this type of secularism is in fact espoused by a tiny minority in India, this is the straw man that most anti-secularists fear and try to destroy. The protagonists of this view, which includes some orthodox Marxists, rationalists and atheists, see anything that is religious as anti-intellectual obscurantism. They attempt to speed up the natural demise of religion (quite inconsistent with their own theory, of course) through propaganda and even outright persecution and suppression of religion as was done under the Bolsheviks led by Lenin and Stalin.

THE ANTI-SECULARISTS

Today there is widespread concern that Indian secularism is facing a serious crisis, and that what came to be known as the

Nehruvian consensus has collapsed or is collapsing. We find an increasing use of religion in the social construction of ethnic and communal identity which is made the basis for the articulation of common economic interests and political mobilisation. There is also the construction of an unprecedented pan-Indian Hindu consciousness that cuts across caste and regional divisions. This has often been described as the 'Hindu backlash', the Hindu reaction against the political mobilisation of other religious groups such as the Muslims and the Sikhs. There is little doubt that these movements are responses to a wider cultural crisis associated with 'modernisation' that has also brought in its wake social dislocation and perhaps a pervasive sense of anomie. It is in this context that the attempt to re-examine Indian secularism is gaining prominence.

As with secularists, so too with anti-secularists, there are several kinds. I shall not concern myself with the communalist critics of secularism, whether Hindu, Muslim or any other variety, nor with the atheist-rationalist critics who see Indian secularism as a sell-out that compromises with religious obscurantism. There is also the silent majority, the millions of genuine religious believers who see secularism as a threat to their religion. The new critics of secularism that I examine here claim to speak on behalf of this majority. I shall discuss below the views of three representatives of this group, Ashis Nandy, T N Madan and M N Srinivas.

Ashis Nandy (1985, 1986) argues that secularism in India has exhausted its possibilities and is today positively harmful. According to him it is secularism and modernity that are the sources of the new religious violence. A 'gift of Christianity' and a child of modernity and colonialism, secularism is a product of western science and rationality and today functions as the ideology of the modern state which Nandy sees as the source of most contemporary problems. Nandy argues that it is the secular state and its elite, with its instrumental rationality and amoral and manipulative technocratic-managerial ethos, that has been responsible for the greatest atrocities of this century from the third reich to the gulag to Hiroshima to the anti-Sikh riots in Delhi. Thus Nandy's rejection of secularism is rooted in a two-fold critique: a critique of modern culture and society that approvingly and respectfully draws on the Gandhi of *Hind Swaraj*, and a critique of the secular state. In a posture of moral outrage, Nandy states that the Indian secular state has much to learn about morality from Hinduism, Islam and Sikhism, while Hinduism, Islam and Sikhism have nothing to learn from the secular state in this respect. As an alternative

to secularism Nandy pleads for the recovery of India's traditional religious tolerance which, he argues, must be freed from the imperialism of the western category of secularism. The greatest representative of such tolerance was Gandhi, but it is also still widely practised by the masses of non-modern, peripheralised believers as distinguished from the modern secular rationalists and the semi-modern zealots.

Much like Nandy, Madan (1987:748) states that "...in the prevailing circumstances secularism in south Asia as a generally-shared credo of life is impossible, as a basis for state action impracticable, and as a blueprint for the foreseeable future impotent". South Asian religions, argues Madan, are unique; they are "totalising in character, claiming all of the followers' life so that religion is constitutive of society". While he acknowledges that these religions make the distinction between the sacred and the secular, he argues that they arrange the two domains in a hierarchical order. It follows that these religions are incompatible with the ideology of modern secularism.

M N Srinivas' critique of Indian secularism appeared in a short article in the *The Time of India* in 1993. Unlike Madan and Nandy, Srinivas was not directly addressing social scientists or intellectuals and therefore his arguments are less theoretical and less detailed, and presented in his usually sensitive and eminently readable style. Srinivas finds secularism wanting because he believes that India needs a new philosophy to solve the grave cultural and spiritual crisis facing the country, and "that philosophy cannot be secular humanism. It has to be firmly rooted in god as creator and protector." Similarly, India and the world cannot afford the mindless consumerism that is being promoted by the media. The only realistic option, sustainable development, too "needs to be underpinned by a proper *weltanschauung* and that cannot be secular humanism" either. Srinivas' call is for a spiritual renewal and a renewal of faith in god as saviour. He is very much concerned about the corruption, materialism and consumerism which, he apparently believes, is a product of secularism. Underlying his critique there appears to be a nostalgic longing for a moral social order that is organic, harmonious and holistic in contrast to the individualistic, amoral, secular order.

CRITIQUE

As we have seen, both secularisation and secularism are multi-dimensional and complex concepts with multiple referents. These authors do not define their concepts systematically or clarify if they are rejecting all aspects of secularism or only some, and if the latter, which ones. When we examine

this issue systematically we find that these writers may be quite happy with several aspects of Indian secularism, especially those upheld by the legal-constitutional system.

First, I think it is fair to say that none of these critics would be in favour of a theocratic state that would bring the state, bureaucratic and legal systems under the domain of religion. Nandy and perhaps the others to a lesser degree are critics of the modern state, but until the state withers away or is radically transformed, all of them are very likely to be in favour of the three main principles laid down in the Constitution, viz, freedom of religion, equality of citizenship and separation of state and religion. They have not expressed their views on the thorny question of personal laws based on religion, but their anti-secularism is certainly not based on religious fundamentalism or sectarianism and so they are likely to be in favour of a sensitive and rational arrangement that can accommodate both religious pluralism and democracy in the country.

Second, it is equally unlikely that any of these critics would object to or be uncomfortable with the secular institutions of Indian society such as universities, hospitals, laboratories and scientific institutes in which most members of the Indian intelligentsia including themselves function. Srinivas, for example, is an exemplary model of a secular intellectual of India; a few comments about his role and work can illustrate the point I am making. Generally regarded as the doyen of Indian sociology and anthropology, he has been a tireless promoter of these disciplines, a teacher and practitioner of a sociology that is the very model of a rational, scientific, critical and 'secular' intellectual 'project'. Perhaps more important, he played the leading role in building the eminently 'secular' sociology department in Delhi University which has, during the past four decades, attracted some of the best faculty and students in the country regardless of caste, religion, theological persuasion, region or gender, far ahead of his time in this last respect. These women and men have engaged in rational debates about social issues including religion. When he raises questions about Indian secularism it is unlikely that he is questioning free and secular institutions of this kind.

Third, there are many social changes that have taken place in India generally associated with secularisation which the intelligentsia have regarded as 'progressive'. These changes have affected some of the most oppressive aspects of traditional religion such as widow-burning and untouchability. In his most recent essay, Srinivas describes the erosion of the practice of purity and pollution and the enlargement of the caste-based endogamous groups among the middle

classes of India. He certainly does not indicate any unhappiness with these changes. It is very unlikely that, on the whole, the other critics too would object to these changes. It is, of course, true that these oppressive religious institutions and practices have been criticised and attacked from within by religious reformers and protest movements. The most celebrated of these in modern Indian society include Ram Mohan Roy, Vivekananda and Gandhi. In recent years writers such as Ashis Nandy and U R Ananthamurthy have popularised the concepts of 'critical traditionalism' and 'the critical insider' to refer to these critics. However, there are two important respects in which these critics should be regarded as associated with secularisation of society. First, secularisation as a historical process has brought with it everywhere a new critical consciousness providing a certain impetus to the potential reformers. Second, as I have argued above, no society is purely religious or purely secular, both the distinction and the separation of the sacred and the secular is a matter of degree. Those aspects of social and cultural life that fall under the domain of the religious are never fixed and immutable. While in pre-modern societies protest movements have typically drawn on religion to unmask and reveal hidden ideologies and wily priestcraft, in the modern world they have drawn on secular ideas to do the same.

It seems clear then that the focus of these new critics is what was described above as the third model of secularism, viz, irreligious humanism and atheistic materialism. Madan, for example, devotes a considerable section of his paper to attacking Nehru and Nehruvian socialism, in effect confusing Nehru's personal rationalist convictions with the secular institutions that he helped to create for the country. While Nehru may have hoped for the eventual disappearance of all that he regarded as religious obscurantism, it is clear that nothing in the Indian institutions or policies aims at restricting religious freedom or suppressing religion. I have discussed this elsewhere (1991) in detail and will not pursue the discussion here.

A critique of the state underlies the writings of all the three. For Nandy the state itself is to be rejected with modernity, rationality and secularism; but his radical critique provides neither an alternative to the state nor an alternative model of the state. Srinivas does not engage in a diatribe against the state, but he links the 'licence permit raj' with the corruption, irreligion, materialism and the culture of consumerism that have destroyed the moral fibre of Indian society. His is a call for a new *weltanschauung*, or rather a renewal of faith in the old that would underlie the national effort in nation-building and development. It is not clear whether he

would have the state promote such a *weltanschauung* or merely like to see it permeated by such a value system and a spiritual ethos. Madan too is against the secular state, but does not suggest any alternative. It must be conceded that secularism in India today is too politicised and too 'statist', acting as an ideology of the state and an instrument of power. It is necessary to find ways to depoliticise secularism and to move it further into the domain of civil society. Nevertheless, one is left to wonder what could possibly replace the secular state. Given the fact that the modern state is not about to wither away and given the impossibility of resurrecting a presumed earlier society in which rights were guaranteed by 'dharma' rather than the state, it is necessary to ensure that the state is a democratic and secular one if rights and freedoms are to be guaranteed in the highly pluralistic societies of south Asia. In fact, it is difficult to see what the alternative to the secular state would be other than a theocratic state or a patrimonial one.

Madan's argument about the uniqueness of south Asian religions is empirically untenable, idealistic and reductionist and smacks of orientalist ideology. First, Madan himself is quite ambiguous about this dichotomy between western and eastern religions. He acknowledges the universal distinction between the sacred and the secular, but goes on to argue that the south Asian religions arrange the two domains in a hierarchical order. But he also states that "the world's great religious traditions do seem to speak on this vital issue with one voice". Where, then, is the radical difference? Apparently, only in post-reformation Christianity, especially protestantism. Madan argues, following Max Weber, that the reformation made a major departure in this regard. He quotes Peter Berger's classical statement that "protestantism cut the umbilical cord between heaven and earth" (1987:753). Secularism in the west, then, emerged from the dialectic of modern science and protestantism. Madan will readily admit, I think, that this is also the dialectic of modern capitalism, what Max Weber referred to as the rationalisation and the disenchantment of the modern west. Modern social science from the time of Marx and Weber has stressed the universalising character of this process historically, crossing borders from protestant Switzerland and England to catholic France and Belgium and then to the non-Christian societies of the east. The point is that it may not be the uniqueness of Christianity that explains secularisation in the west, but the logic of capitalism and industrial society. To be sure, this logic or this impulse may have originally had a special connection with

protestantism, but as Weber himself pointed out, this connection was a historical one and the dialectic of capitalism was capable of severing its connection with protestantism.³

Second, the dichotomy between the totalising character of south Asian religions and the compartmentalising character of western religions, even post-reformation ones, is a false one and is another version of the orientalist dichotomy between the spiritual east and the materialist west, the other-worldly religions of the east and the this-worldly religions of the west. The quotation from Gandhi that Madan provides to support this view, viz., "For me every, the tiniest, activity is governed by what I consider to be my religion" (1987:752) could equally have been from St Ignatius of Loyola or St Francis of Assisi. The language of Hindu and Muslim saints and mystics must be compared with that of Christian saints and mystics and not with that of rational, utilitarian philosophers and sociologists of the west. Monks and mystics in the most secularised parts of the west continue to strive for a life that is totally in the presence of the divine and to perform every single act informed by the right 'intention' of performing God's will. To take one example that I know personally a Jesuit is always and everywhere expected to strive to perform every act "for the greater glory of God", represented by the Latin logo, *Ad Maiorem Dei Gloriam*. It may be argued further that the new ecological consciousness among religious people in the west calls for a return to the holistic 'pagan' consciousness of the unity and connectedness of all things. But all this is in the mystical and theological realm, as is Madan's argument. Madan's interpretation of the pre-secular Indian society as characterised by hierarchies of domains in which the economic and the political were subordinated to the religious and theological is simply idealistic and reductionist. Not only does he, like Nandy, underestimate the extent of exploitation, strife and violence that existed in Indian society, but he assumes that theological ideas determine and explain the everyday life of individuals and the institutions and structures they create. One does not have to be a materialist determinist to see the insight in Marx's saying that it is not the consciousness of men that determines their social being, but that it is their social being that determines their consciousness.

Srinivas does not tell us why the *weltanschauung* needed to meet the crisis in India "cannot be secular humanism", but presumably implies that it is inadequate to provide the ethical or spiritual basis for the needed renewal. He simply assumes that morality and spirituality are necessarily religious. Keeping aside theoretical and

philosophical considerations about the relationship between religion and ethics, one could point out that the historical record is less than clear to determine whether religion has been an instrument in the creation of a more humane and just society. It is well known that inquisitions, crusades, witch-burning, genocides (both physical and cultural), widow-burning and untouchability have been practised by what must be regarded as highly religious (totalising in the sense of Madan) societies. What is worse, these practices were justified in the name of religion. In our own day we must presume that the 'hanging judges' of the Iranian revolution who presided over tens of thousands of executions of political and religious opponents, are religious men, but many of us will not necessarily see them as moral, spiritual or humane. Srinivas is aware of "the basic difficulty in bringing in religion..." and that "volumes have been written on the harm inflicted by established religion". But his solution to this problem is to call for the universal "philosophia Perennis" *a la* Leibnitz, the Upanishadic seers, bhakti saints, Sufis, and Jewish and Christian mystics. This is a very attractive position, and many intellectuals and seekers disillusioned with institutional religion will support him on this. The problem, however, is that sociologists, including Srinivas (1952, 1993), have long known that religion is not just a belief system but is, above all, a community (church) united by a common belief system as well as by a ritual life. The sense of community and identity is among the most central elements in the lives of the vast majority of believers. One may ask further if it is possible to have a religion that is not institutionalised, that is nothing more than a perennial philosophy. To the extent it is possible, the religion that comes close to this model is the privatised religion that we see in secular, humanist societies.

It is not surprising that intellectuals like Srinivas are deeply concerned about secularism, for in India today the debate about secularism is far more than an academic one. A sociologist who writes in support of or in opposition to the secular character of the nation, or to the ethos of secular humanism associated with it, bears a grave responsibility in view of the implications of her/his position. Historically, the struggle against caste oppression, patriarchy and communalism was associated with the possibility of a critique of religion that revealed the hidden ideologies protecting vested interests. A sociologist in India who rejects secular humanism without at the same time acknowledging the ideological character of religion will be seen by the secular sociologists as lacking a certain authenticity. Sociology itself is a child of the enlightenment and became possible only when the

historically contingent social and cultural domain could be separated from the 'natural' and necessary God-given order of things. Critical social science became inextricably bound with the basic 'project' of the enlightenment, human liberation premised on a critique of society. The history of social science from the enlightenment to Hegel, Marx, Weber and Mannheim has gone a long way in unmasking religion to reveal these ideologies. But sociologists and anthropologists have also discovered critical religion, the prophetic and utopian elements in religion that have given rise to religious reform and protest movements. At least since Weber, radical sociologists have recognised both the ideological and utopian elements in religion; few scholars today would reduce religion to false consciousness. In many parts of the world the critique of religion that was originally grounded in secular humanism has now been integrated into critical theories. Liberation theology, feminist theology, ecological theology and dalit theology are good examples of these. This is not unique to Christianity either. No one will deny that while Gandhi was a critical insider *par excellence*, he absorbed many elements of the liberal humanist critique of religion into his own thinking. Without this influence it is doubtful if he would have been able to separate untouchability, inequality, and other inequities from the essence of religion as he was able to do. Sociologists who call for a return to religion uncritically are ignoring the fact that India has a long way to go in liberating its people from the oppression of religion; that caste, patriarchy and communalism are still practised in the name of religion; and that demystifying society and unmasking myths continue to be part of the 'project' of critical sociology. If Srinivas is advocating an ecumenical religion that can accommodate all the religions of India as well as such oppressed classes as the ex-untouchables who harbour bitter memories of institutional religion, no one will seriously object to this. In fact, with all its sins and imperfections, secularism in the sense in which it is defined in the Indian Constitution appears to provide the best conditions under which such pluralist and ecumenical religions can flourish in India.

This brings me to my last point about the relationship between democracy and secularism. Do Nandy, Madan and Srinivas seriously believe that democracy would be possible in a non-secular India? Nehru certainly did not think so. If democracy requires a minimum consensus about the basic values and institutions of society and about the rules of the political game, could such a consensus be built on a religious basis in pluralist India, or anywhere else, for that matter? Will this be based on communal

electorates, a historical alternative that Indians remember with a deep sense of tragedy and independent India rejected at the very outset? Indeed, it is difficult to imagine the face and shape of a non-secular India without deep foreboding as one is hard put to find a single empirically existing model of genuine democracy that is also non-secular.

CONCLUSION

There is no doubt that a vast number of people in the world, including those living in the so-called modern secularised societies, are religious. The experience of what Rudolf Otto called the tremendous mystery (*'mysterium tremendum et fascinans'*), and a sense of connectedness with an immense reality of which we form a tiny part, create the universal experience of what we call the religious. Anthropologists and historians know of no society without religion, and few social scientists today would see secularisation as an irreversible and progressive process. It is also true that the crisis of our civilisation – the injustice, violence and mindless destruction of the earth – is renewing that deep sense of the sacred and that universal search for 'meaning'. Some scholars are even speaking about the re-enchantment of the world [Berman 1981]. Confronted with this situation, it is difficult not to be in full sympathy with those, like Srinivas, who are dissatisfied with a secular humanism that has failed even to address this deeply felt malaise. Nor can one be indifferent to the search for holistic life that can transcend the artificial dichotomisation of the religious and the secular. It would be difficult to deny that today secularism, and especially the privatisation of religion, acts as an ideology for institutionalised greed, materialism, corruption and the culture of consumption.

I am unable to see, however, what kind of a social and political order can replace India's secularism without causing serious rupture to those social arrangements, values and ideals in the country that most of us deeply cherish. These include its historical legacy of religious pluralism and its celebration of diversity, its ability to maintain a working democracy for half a century with considerable civic freedom, free inquiry and exchange of ideas, and the valiant struggle of its people against oppression based on caste, communalism and patriarchy in their struggle to build an egalitarian and humane social order. I believe that these difficult but enduring struggles have the best chance of success in a secular India in the sense in which I have described it. At least, this must be so until a better and viable alternative becomes available.

Notes

[An earlier version of this paper was presented at the World Congress of Sociology in Bielefeld, Germany, July 22, 1994. I am grateful to the participants of the Research Committee on the Sociology of Religion for their comments. I also wish to thank M N Srinivas and U R Ananthamurthy for reading the paper and providing their comments.]

- 1 I am referring here especially to sociologists and anthropologists. It is interesting to note that the debate about secularism in India has so far been very much dominated by historians, and to a lesser extent also by political scientists.
- 2 The simultaneous implementation of these three principles has been found to be problematic in all modern societies. A case in point in India is that of different personal laws followed by different religious communities. While this fulfils the principle of freedom of religion it can be seen as violating the principle of equality of citizenship. For example, Hindu and Muslim women do not enjoy the same rights to divorce, inheritance or economic support.
- 3 I am aware that a different interpretation of this issue has been advanced, notably by protestant theologians such as Harvey Cox (1966). According to this thesis, the historical movement towards secularisation and the establishment of the 'secular city' is inherent in biblical (Judeo-Christian) religion. Some support for this position has been found in the writings of Weber and Peter Berger, who draws on Weber, among others, also shows some sympathy for this position. Interestingly, some catholic theologians [Baum 1975:155] contended that this argument was informed by a specifically protestant reading of the scriptures and the historical evidence. Interest in the debate has declined in recent years. My own view, of course, is that such a thesis is not a tenable one.

Total Factor Productivity Growth in Manufacturing Industry

P Balakrishnan
K Pushpangadan

IN our article [Balakrishnan and Pushpangadan 1994] we had argued that appropriate measurement of value added at constant prices is a prerequisite for the estimation of productivity. We had then proceeded to provide a demonstration of this principle by providing estimates of total factor productivity growth for Aggregate Manufacturing in the Indian economy. We observed that the measurement of value added has implications for the estimated growth of TFP. We consider it to be a reflection of the fact that our point has been taken seriously that our original paper has been replied to.¹ In this brief note we reply to our critics. Here we report the results of substantial further work on TFP growth in manufacturing industry. These results strengthen the conclusion of our original paper.

I J Ahluwalia (1994) commences her note with a suggestion of alternative titles for our article, all to do with the growth of value added in the manufacturing sector of the Indian economy. We believe that given what we had wished to convey, the title that was chosen by us is word-perfect. If Ahluwalia is more concerned with the growth of value added she needs to first address the arguments of Bhatia.²

• We are astounded by Ahluwalia's suggestion that a researcher is excused from a serious consideration of the concerned problem so long as the CSO has not 'found' reliable data for arriving at double-deflated value added. At least the CSO has stated the matter clearly: "The ideal method for working out the constant price estimates is the double deflation method."³ No such caveat appears in Ahluwalia's work. However, Ahluwalia has shown herself not averse to referring to the bias in the single-deflation methodology when it has suited her. For instance accounting for the slower growth of TFP for 'petroleum and coal products' during the 80s Ahluwalia takes recourse to arguing that her methodology "would necessarily result in undervaluation of the value added for this sector" [Ahluwalia 1991:39] where the relative price of inputs has risen very considerably. In this connection, the author has scrupulously suggested that "the results need to be interpreted with caution" [Ahluwalia 1991:38]. The reader ought to have been invited to exercise similar caution with regard to the results across the board, considering that it is eminently advisable.

Ahluwalia is mistaken in suggesting that in our exercise we freeze the "material use structure" as recorded in the Input-Output Transactions Table for 1973-74. To the contrary, with the express intention of capturing changes in the input-output relations, if any, we had re-worked the entire exercise of double deflation using a materials price index that is constructed with weights from the year 1983-84. The econometric results revealed that the absence of a positive turnaround in TFP remained unchanged. Not only was this issue discussed in the text⁴ but also the result was reported in Table 3. Ahluwalia has failed to appreciate the implications of the exercise as reported.

Finally, in our paper we had avoided any reference at all to the implications that our results have for the evaluation of policy. But this has not restrained Ahluwalia from expressing her view on the implications of the estimates of the double-deflated value added figures reported by us, divining the message that "we were ahead of China in the game of producing economic miracles". While we take the view that readers of our work are at liberty to read whatever they may wish into it, we do believe that comparisons with east Asia, though flattering, tend to be a little out of place for India, an economy where none of the pre-conditions⁵ identified with the spectacular performance in the east have ever existed. Moreover, it has not escaped our attention that of the close on 26 years starting 1959 for which she has estimated TFP, productivity peaked in 1961 itself [Ahluwalia 1991: Appendix 1, Table 1]. This has two implications. First, the so-called 'turnaround' in productivity growth during the 1980s can now be seen in perspective. Clearly, the point in time at which the sample period is split in order to establish a structural break needs to be reckoned with. Otherwise, the results are riddled with the doubt of having been influenced by a 'low base'. Secondly, carrying on in Ahluwalia's vein, if the estimates of total factor productivity provided by her are to be believed, Indian industry was most efficient at the height of the licence-permit raj. This in a tract that emphasises the importance of liberal policy regimes for TFP growth!

We now turn to the response to our paper by Bakul and Ravindra Dholakia (henceforth 'D-D') which, by contrast with Ahluwalia's, we find very substantial indeed, and consider a constructive intervention. According to

our reading, D-D make one important point. It is that the weights used in the construction of the index of materials price must be drawn from the segment of manufacturing that is covered by the Annual Survey of Industries, the source of our data on input and output values.

This is well taken. We had used the input-output statistics for the entire manufacturing sector, while ASI covers 'registered' manufacturing alone. D-D proceed to double deflation using what are claimed as appropriate deflators in that these pertain to registered manufacturing sector alone. The authors now produce decadewise rates of growth of the TFP estimates that follow. These figures point to a rise in the rate of growth of TFP in the 80s, the celebrated 'turnaround'.

We are unable to comment with any confidence on the results presented by D-D because they have not been explicit on the method they have adopted in the construction of the weights that they present. They state that they have 'estimated' these [Dholakia and Dholakia 1994], but the methodology is not stated. We remain sceptical as to what is possible under the present situation with regard to data availability and, therefore, as to the adjustments made by D-D to arrive at input-output statistics pertaining to 'registered' manufacturing. However, it did strike us, while eye-balling the data, that the weights produced by D-D are not very greatly different from ours (Table 1 in D-D), and that therefore the results ought not to be very different if the D-D set of weights were to be used in the construction of the materials price index. We therefore re-worked the exercise using the said weights while retaining the rest of the data as in the original. The price series and the resulting index of TFP are presented in Table 1 and the statistics of a test for a 'turnaround' are presented in Table 2 (under the column heading 'DD'). Note that the latter do not support the claim of a higher rate of growth of TFP since 1980. It appears, therefore, that there need not be any particular caution on the acceptance of our original estimates of TFP, at least not on the grounds of our having used inappropriate price deflators the first time round. Despite the fact that our original results on TFP survive the introduction of a new set of input-price deflators, a crucial variable in the exercise, we believe D-D to have raised a valid point. However, it would have helped their cause greatly if they were explicit about the data and the methodology they have adopted, across the board. As for the data, we would have liked to know where the capital stock and employment data is from. The methodology is not always clear either. For instance, we are not even able to

replicate their estimates (see D-D, Table 2: 'average rate of growth') of the rate of growth of real value added (VADD) implied by our study (reported in Table 2 of our study) when we fit (in our view, the best procedure) a semi-log trend equation to the data.

DESIRABILITY AND CONSEQUENCES OF DOUBLE DEFLATION

On the question of the desirability of double deflation we believe that the initial section of our original paper had unambiguously established the superiority of double deflation over single deflation as a procedure for obtaining value added at constant prices. In any case, the suggestion that nominal values be deflated by their relevant prices would appear to require no special justification. Quite simply, computing real value added by single deflation does not correct for changes in the relative price of inputs whenever they occur.

That real value added computed by double deflation – being an 'external average', in that it involves some negative weights – could acquire a minus sign does not worry us in the least, and, despite the proclamation by D-D, is no discovery. It can arise when current quantities are evaluated at fixed-base (relative) prices. Viewed from the perspective of Economic Theory, it is no mystery that differing techniques are not equally profitable at a constant set of prices. A solution to the measurement problem induced by this is provided by a continuous shift in the base of the price indices. All this has been long recognised,⁶ and has not been seen as a reason for second thoughts on the superiority of 'double' over 'single' deflation when estimating value added at constant prices, as evidenced in the practice⁷ of National Income Accounting in many economies.

Finally, since D-D have based their argument on the idea of a production function, we might add that it has also been established [Sims 1968] that the 'concept' of double-deflated value added requires no more stringent assumptions for its justification than the concept of 'real value added' itself. It is often forgotten that the latter is premised on the existence of a production function that it additively separable in value added and materials. Thus we have the extreme view of Sims: "The question is not really 'Is double deflation the right way to deflate value added?' but rather 'Does the notion of real value added make any sense?'" [Sims 1968:471].

SENSITIVITY ANALYSIS

However, even having assumed the separability of the production function, as hinted at above, the double deflation of value added as it is practised does introduce a measurement bias. This stems from the fact of the prices used being index numbers with fixed base. In principle, the solution is simple,

involving the use of Divisia indices [Bruno 1984: 26, footnote 26] that can be approximated by chain indices. The practical aspects of this procedure, however, are as yet insurmountable. Bruno, who as far as we know was the first to have raised this point, has suggested a test of the bias by re-working real value added "... with alternative choice of base year weighing (once using beginning of period and once using end period weights, say)."⁸ In the present context it would have the effect of testing for the sensitivity of the measure of TFP derived from double-deflated value added to the choice of base year for the prices. While admittedly only an 'informal' test, it is the best that can be achieved under the circumstances. This we have now done by using price indices base 1981-82=100 (as opposed to 1970-71=100 in our original paper), the input-price index having been combined with weights from the Input-Output Transactions Table for 1983-84. Notice that given the considerations of the need to match the date of the input coefficients with the base year for the price indices, the period of the study, and the availability of data for the Indian economy we consider this the obvious choice of elements for a comparison. The resulting index of input price is available from us upon request. The associated index of TFP is included in Table 1. The results of the test for a turnaround in productivity growth since 1980 are presented in Table 2 under column heading 'BP: II'. From this, note that the coefficient on the 'time dummy', testing for an acceleration of TFP growth from 1980, is negative, as it was in our original paper. In this sense, our original belief that the alleged improvement in TFP growth may be an artefact resulting from inappropriate measurement of value added is yet to be falsified.

For those methodologically inclined, we might add that we had in our original paper moved half-way towards correcting for the measurement bias due to double deflation by re-working our exercise using input prices with 1983-84 weights [Balakrishnan and Pushpangadan 1994: Table 3]. We did not however go the whole way by shifting the base of the price indices. This we have now done here. No doubt, the process must be continued as price indices with more recent base periods and input-output coefficients relating to subsequent dates become available.

Two final observations on our estimates are in order. First, it is easy to discern that the level of TFP differs according to the weighting pattern of the price indices, thus making it difficult to proffer any one series as the 'correct' one. This is a hazard of working with indices with discontinuous base years. Were price deflators available that would make it possible to undertake double deflation with price series incorporating a continuous shift in the base year, we

would have been left with one series. Secondly, it has been pointed out to us that the index of TFP based on value added computed by double deflation varies more (has a higher standard deviation) than TFP based on value added computed by single deflation,⁹ and that this signals a flaw in the methodology we prefer. However, this is

TABLE 1: TOTAL FACTOR PRODUCTIVITY

Year	TFP 'B-P: II'	TFP 'D-D'
1970-71	100.0	100.0
1971-72	82.7	75.8
1972-73	81.1	73.1
1973-74	75.2	87.3
1974-75	98.0	99.4
1975-76	97.4	86.2
1976-77	99.2	100.3
1977-78	113.6	108.2
1978-79	145.7	124.7
1979-80	117.7	116.6
1980-81	91.6	100.4
1981-82	107.7	117.6
1982-83	130.2	135.8
1983-84	139.8	133.2
1984-85	132.6	132.8
1985-86	136.1	124.9
1986-87	141.1	115.0
1987-88	136.7	119.1
1988-89	131.6	122.0

Note: 'TFP' is an index base 1970-71=100. 'B-P: II' is TFP based on real value added computed using 1981-82 prices and input coefficients for the year 1983-84. 'B-P: I' presented in Table 2 of Balakrishnan and Pushpangadan (1994), was based on value added computed using 1970-71 prices and input coefficients for the year 1973-7. 'D-D' is TFP based on real value added computed using 1970-71 prices with an input-price deflator implied by the weight presented by D-D (1994).

TABLE 2: TESTING FOR AN ACCELERATION IN TFP GROWTH

	'B-P: I'	'BP: II'	'D-D'
Constant	4.33 (61.57)	4.33 (64.00)	4.33 (56.16)
D ₁	0.60 (2.80)	-1.01 (-4.89)	0.37 (1.59)
Trend	0.05 (4.78)	0.08 (6.92)	0.04 (3.47)
D ₂	-0.05 (-3.17)	-0.09 (-5.50)	-0.04 (-1.88)
R ²	0.80	0.87	0.69
D-W	1.46	1.41	1.51

Note: t-ratios in parentheses. All estimation was done using 'PC-GIVE' version 6.01. The estimates are from a semi-log trend equation for TFP, with nominal value added having been deflated differently each case. The precise details underlying the calculation of value added in case TFP under 'BP: I', 'BP: II' and 'D-D' are outlined in the notes to Table 1. T=1970-8. 'D1' and 'D2' are dummies that test for shift in the level ('constant') and in the rate of growth ('trend') of TFP starting from 1980-81. See Balakrishnan and Pushpangadan (1994) for further details of data and method. All data are available from the authors upon request.

based on an incomplete understanding of the methodology of double deflation. The relative variation of the series on real value added is purely a question of the variation in the relative price of inputs. The proof of this runs in terms of comparing the expressions for the variance(s) of real value added under each definition (i.e. single deflation and double deflation). This was suggested to us by Bharat Ramaswami, and we may be able to trace the old envelope for anyone interested. Counter-intuitive as it might seem, in periods when the relative price fluctuates, value added computed by double deflation will vary more than value added computed by single deflation precisely because the former incorporates relative price changes.

CONCLUDING REMARKS

Dholakia and Dholakia are not entirely off-the-mark when they say: "The B-P study may be considered to raise a methodological point about the appropriate measurement of the real value added and the empirical exercise reported in the paper can only be seen as an illustration of the argument" [Dholakia and Dholakia 1994]. However, we also believe that, in the process, we have conclusively pointed out that the question of productivity growth in the Indian manufacturing sector is far from having been settled. First, there is the question of the behaviour of productivity itself. Three recent studies report conflicting results.¹⁰ Second, there is the relationship between productivity growth and the policy regime. The nature of this relationship for Indian manufacturing is not clear. We find ourselves in agreement with the management guru (!) Michael Porter who states: "The productivity in Indian industry is very low in terms of international standards and one of the reasons for this is the fact that till now reforms have concentrated on the macro-economy with the result that the micro-economic reforms have been ignored [Porter and Ghemawat 1994]. Given that there was so little reform in the 80s the claim that there has been an improvement in productivity during this period needs to be better understood.

Notes

[For research assistance we thank M Suresh Babu.]

- 1 We are also pleased to observe that the implications of the estimates of productivity growth reported by us have also begun to receive some notice. See Ghose (1994).
- 2 See Bhatia (1987, 1990). In retrospect, we have ourselves erred in not citing Bhatia's contribution to the question of estimating value added in Indian industry, work that precedes ours. Also, we have only now become aware of the perceptive review of Ahluwalia (1992) by Lochan which has argued for the need for double deflation in the estimation of value added in Indian industry. See Lochan (1992), p 113.
- 3 'National Accounts Statistics, Sources and Methods', CSO, p 26, April 1980.

- 4 "The sensitivity of the estimates of value added to the input-output coefficients used as weights in the construction of the input-price deflator.... was now examined." Balakrishnan and Pushpangadan (1994: 2032). Incidentally, a move further down this direction has been undertaken in this paper. Await the discussion of the results presented in Table 2.
- 5 Principally, very high (private) investment and growth of human capital. See the review of the World Bank study, *The East Asian Miracle* by Page (1994).
- 6 For a discussion, see David (1962).
- 7 See Bruno (1984). In fact, Bruno refers to the very practice of double deflation as leading to a measurement bias, which we turn to below.
- 8 Letter to the authors dated June 23, 1994, Washington, DC. Available on request.
- 9 See Table 3 of Balakrishnan and Pushpangadan (1994) for the estimates.
- 10 Mohanty (1992) reports a deceleration in TFP growth in the 80s. It is also interesting to note that Mohanty reports declining productivity in the presence of improved growth of output (value added). There is often a reluctance to accept this as a possibility. ICICI (1994) reports negative growth till 1987, after which a major turnaround is reported. This study is however plagued by the problem of having measured (while being aware of it) the labour input in value terms rather than in quantities. Moreover, its data base is limited to the segment of the private corporate sector that is financed by the ICICI itself. Finally, there is Shrivastava's most impressive doctoral dissertation from Boston University. However, the results reported by him are not conclusive. When the growth-accounting method as followed by us is adopted TFP growth decelerates (and is negative after 1985-86, the year seen by Shrivastava as coinciding with liberalisation. On the other hand, when a production function is fit a higher rate of growth of TFP follows from 1985-86. Nevertheless, we are pleased to mention that this study is the only other one to proceed via double deflation even though not consistently, nor is the weighting scheme for the input-price index made explicit, which must lead Dholakia and Dholakia to, quite legitimately, quibble a bit. See Shrivastava (forthcoming).

DESCRIPTION OF LAND

Property Number	- 123/736 (Part), K.D.A. store site
Estimated Area	- 14,376 Sq. metres
Max. Permissible Ground Coverage	- 50%
Max. Permissible F.A.R.	- 200
Max. Permissible storeys	- one Semi Basement and Six floors (Max. 20 mts. height)
Reserved Auction rates of the land	- Rs. 2800/-per Sq. mts.

The disposal of the commercial land is proposed to be done through auction. The booklet containing details regarding registration, rules, terms and conditions will be available on sale from 20.2.95 to 20.3.95 on payment of Rs. 500/-, but out-stationed desired by post on crossed D/D of Rs. 510/- in favour of "Kanpur Development Authority, Kanpur".

Person interested in participating in the Auction will have to deposit a Bank Draft on any Scheduled Bank for Rs. 10,00,000.00 (Rs. Ten Lacs) in favour of Kanpur Development Authority, payable at Kanpur by 20-3-95. The Registration money will be adjusted in the account of a successful bidder and to others, it will be refunded on the spot.

For further details interested builders/promoters may contact Mr. J.P. Singh, Jt. Secretary K.D.A., Motijheel, Kanpur. Phone : Office : 294992-93 Fax : 0512-210881

Vol XXX No 10

March 11, 1995

Is Political Economy Dead?

Notices of the 'death of political economy', in line with similar pronouncements that 'Marxism is dead', are false. The relevance of classical political economy, and especially its Marxist variant, as a means of analysing problems of economic development remains undiminished.

507

Lessons for Economic Reformers

While eastern Europe has been the hardest hit because a system put in place over many years, which had guaranteed the basic needs of the citizens, was dismantled in rapid order under the diktat of the IMF and the World Bank driven by the western countries, the crisis of living standards posed by economic reforms is by no means unique to post-socialist Europe. What conclusions do we draw from yet another year of failure of market reforms to restore sustainable growth to most of the third world?

499

People's Initiative

The deadlock between India and Pakistan can be prised open only by a non-governmental people's initiative.

483, 484

Backseat for Ideology

The absence of critical assessment of the developing reality, nationally and internationally, in the CPI(M)'s draft political resolution for the party's 15th congress next month at Chandigarh shows that the party does not take seriously its professed goal of ideological renewal.

486

Painful Readjustment

Last month's developments in the money market show that the pangs of readjustment from a situation of externally-injected excess liquidity to one of liquidity shortage, which began about three months back, have become acute.

476

Archaeology and Deceit

The World Archaeology Congress dispelled the illusion that there is a difference between the lumpens who demolished the Babri masjid and those who provide the intellectual input for bigotry and xenophobia.

488

Emerging Southern Africa

Relations among the states of southern Africa in the post-apartheid era will evolve according to the dictates of the new world order and South Africa will continue to be the fulcrum of this evolution.

496

Productive Engagement

The importance of Bombay Doordarshan's Marathi serial *Paulakhuna* lay in its attempt to represent the legacy of social reform as the story of women's improvement. In doing so, it forced us to come to terms with the ways in which television culture engages productively with the writing of women's history today.

521

No Model

Surprisingly, we do not have a model for annual plan exercises and the prioritisation to be followed, though the sectoral allocation of resources by the planning system amounting to more than a hundred thousand crore rupees annually profoundly affects the future of the economy and the people.

514

Meo Women

Women of the poor Meo community, scattered over a large area south of Delhi towards the Thar desert and largely comprising small and middle peasants, are subject to customs which keep them economically and socially backward.

490

Conserving Biodiversity

While there are many laws which allow for the conservation of biodiversity in India, many of the provisions cannot be implemented because of existing socio-economic and political constraints.

492

'Breakfast Revolution'

THE antics of Kellogg one thought was too trivial a matter to either ponder over or comment upon. But when EPW (January 28) devotes two columns of editorial space to a correspondent writing about the company with such single-minded enthusiasm, one is forced to do so. There is no doubt that the growing presence of the food industry, and certainly the entry of multinationals, must be taken note of and understood. However, your correspondent, by drawing attention to what I believe are trivialities, in fact, deflects attention from more urgent and relevant issues.

The impact of the the growing food industry on patterns of land use has been pointed out before. All these companies have created captive growth areas for procuring raw materials. That this change in crop patterns, is linked to the consumption patterns in the population cannot also be ignored. And that the increasing consumption is taking place only in one small section, the 'growing middle class' is also fairly clear. Again, that the increasing number of sunflower oil products is related to the 'health conscious' urban middle and upper classes is obvious.

But surely Kellogg can't be credited with either discovering the 'tempting' 'health conscious' market, nor even as it may well turn out, of making a killing on it? What we seem to have missed is that the Indian entrepreneurship had already discovered the growing middle class market a long time back and has been exploiting it, long before Kellogg, a fairly small time player came into the picture. In fact, Indian industry laid the groundwork for the entry of multinationals in this field. Not only that, it has also been doing its bit in attempting to influence food habits. Ready-to-use tomato puree, or Gits' idli mix, or MTR 'puliogare' powder, or the multinational Maggi noodles, may not be as nutritious as the real thing, but they have had an impact on the 'growing middle class', all the same; they have not replaced the real thing either. And that brings us to the second point. The new and quick food market which will not just experiment but will be constant users is likely to be the small section of households with working couples/parents who will use it to supplement other foods. They will pick up Kellogg's cereal, as I would, to be used as an occasional replacement for the regular breakfast, or to supplement it - let's not slight at the time gained by not cooking a breakfast. Who else can afford to pay Rs 35 for a 250 gm of breakfast cereal? And this is hardly the 'janata' which will be bought over by Kellogg's nutrition hype.

Whether good or bad, changing food tastes are a part of the changing life-styles. And

certainly the availability of new food products contributes to it. But then, the appearance of new food products itself is due to the increasing purchasing power of these sections which influences changing life-styles. To credit Kellogg with changing food habits is bad enough. But to substantiate that point by an illustration from colonial history is ridiculous. First, tea is an energy drink; and it does kill appetite and therefore the toiling masses can continue to work even without adequate food. But then the 'national habit' of pan chewing, not surely introduced by the British, also achieves the same result. There is absolutely no evidence, even 'common knowledge' that the 'decline in nutritional status' has occurred because 'chai' has replaced the "traditional glass of milk in the morning". In any case, that tradition is again, probably, only confined to the north. If today even children (of working masses, for I can't imagine middle class children escaping the morning routine of milk) drink tea, it is because of the non-availability (lack of purchasing power for) of milk. In fact tea is used as a weaning food, with the inevitable 'glucose' biscuit, because they are both cheap and available. Second, if children's classics in English are anything to go by, tea was the standard 'tea-time' drink given to children in upper class households, in 19th and early 20th century Britain.

It is unfortunate that in making Kellogg the object of ire, the comment has missed out on the real issue. The growth of the urban middle class has engendered all sorts of change, and some of it at least has had an adverse impact on sections which are already poor. For instance, many years ago it was noted that the urban market for cheese and milk products served to make 'chaas' a

cheap and nutritious drink, scarce in the villages of Punjab. Similarly the nutritional impact of the 'white revolution' is yet to be adequately studied. More importantly, we urgently need to understand and reckon with the impact of the growing food industry on the nutritional status of agricultural populations. Earlier, only commodities like groundnuts and sugarcane were considered 'cash crops'. Today, a whole range of other crop are also 'cash crops': cereals (for Kellogg, Mohan Meakin, Waheeda Rehman or Tarla Dalal); wheat, salt (now iodised), dals (where does the growing 'papad' industry get its raw materials?); vegetables (Maharashtra state's MAFCO frozen peas), etc. How is this affecting the fortunes of the poor, marginal and subsistence farmers? It is a waste of time and effort to be concerned about middle class food tastes and its changing nutritional status. It is a class which has historically been well able to take care of itself. Nor is it possible to halt changing food tastes; that is a part of the cultural change we are witnessing. And then there are enough pro-nutrition movements - anti-milk, pro-egg, vegetarianism, etc - to eventually balance the argument without going the way the American middle class did. The more important issue is to ensure that the changes do not further impoverish the agricultural poor. For which effort unfortunately, the initiative can only be at the grass roots and not among those of us who may read about the 'breakfast revolution' over our 'dosas' and 'paratha/subzi' prepared no doubt by the ideal nutrition-conscious, hardworking wife mother (and executive ?), or our 'bais'.

A Different Way of Seeing

EVERY movement takes time out for stock taking not only because it is an anniversary; the need to examine the past and determine perhaps a future direction emerges in the throes of confusion, a confusion connected with the realisation of the relevance of the movement, and not its dissipation. The ongoing debate on the whys and wherefores of the women's movement, underway for sometime now, are indicators of such a turbulence.

In the last couple of years, there has come up a certain strain of opinion which avers that the women's movement has spent itself out or that the issues it has raised have got so integrated into the mainstream that it no longer merits a separate agenda. Thus, for instance, feminism it is pointed out is not a factor shaping currently dominant structures of progressive thought in India. *Ergo*, it is no longer relevant in the context of progressive movements. At another level however, women's issues are now considered essential components of all 'development' programmes. This accommodation is consciously projected as an indication of the establishment's desirable transformation, making it more sensitive to the real problems of the people. There is, then, a compendium of impressive gains: a state department entirely devoted to women and their welfare; a women-oriented reproductive health policy; a state policy for women, and; processes which have made a permanent place for the state's interaction with women. Here, by definition, the women's movement is accorded a progressive pro-people label, as an agent of transformation.

In other words, the movement's success in gaining recognition is itself a subject of criticism, an indicator that it has spent itself out. For, in order to obtain the accommodation by the state, it has had to bundle away its ideological framework, underemphasise theoretical exercises, paper over discord and pull together various tendencies on issue-based campaigns and coalitions. But it is the very fact of state recognition which has given it the space and the opportunity to expand as it has. What has come about is extraordinary. While the visible, vocal and largely metropolitan women's movement has wrested concessions from the state, at the grass roots, women have mobilised to make use of these concessions, create a space for themselves, and initiate demand for more concessions. This has happened even when the state has tailored the concessions to inflict damage on the dynamics of the very process of creating a movement in opposition to the very founding principles of the state, its class and patriarchal base. As, for instance, has happened with the state-sponsored women development programmes in several states. A state-funded and sponsored women's

movement was and is a contradiction in terms, possible only if the movement is separated from its ideological base. And yet, the deliberate and well-planned violence on the 'sathin', Banwari, in Rajasthan was just one defined example of not only the reaction of the power structures colluding and supporting the state and its institutions, but of the challenge which it is now possible to articulate because of the mobilisation of women, which in turn has undoubtedly been facilitated by the concessions granted by the state in response to the demands of the movement. While violence on women continues to be perpetrated even through newer supposedly progressive and democratic structures, the cognisance of this violence has been possible because of the movement. If, then, today there is debate about what the real concerns of the movement are, then it is an indication of its diversity and therefore its strength.

The emergence of the two somewhat parallel waves has made possible the articulation of feminist issues at different levels in different institutions. Legal challenges have been posed uncovering assumed realities, in a language which redefines issues from a standpoint hitherto unrecognised. In medicine and health care, the challenge has been to the very structure of the knowledge base of generations of practice. The flowering of a distinctively feminist cultural ethos cannot be denied, posing a challenge to conventional forms. The fact that the advance of knowledge, and therefore of the beginnings of a change of practice has come about with the blessings often of international aid and movements, does not make it less significant. Similarly, the Chipko women emphatically underlined what is more or less taken for granted today, the close association of women with nature and of how deeply changes in the latter affect their lives. It may perhaps be too soon to say this, but surely, no other progressive movement has been able to achieve this shake up in the knowledge base which is already being reflected in practice.

However, there is no doubt that the women's movement is at the crossroads. The absence of theoretical underpinnings is beginning to show. Whereas, the evolving of a diverse movement was made possible by perhaps a tacit underplaying of theoretical discussions, the future of the movement now may itself be in jeopardy because of this. The movement lacks a coherent understanding of the basis of women's oppression. There is still lacking substantive Indian work on theoretical issues which would provide an integrative base for the movement, a framework which will coalesce the different trends and tendencies. This poverty of thought has undoubtedly been partly a product of the reluctance of

progressive political movements to either acknowledge the existence of and the need for an autonomous women's movement or integrate feminist theory into a broader political perspective. Discussions in political forums have most often been on issues and rarely on concepts. It is ironical therefore, that the sharpest criticism about the lack of theoretical formulations in the women's movement should come from the progressive political movement.

Feminism locates a different way of seeing, and this is why it can identify the power structures which have been kept well-hidden by dominant sections. The question we need to address is whether this different way of seeing and understanding, and therefore of mounting a challenge, can be subsumed into other ideological frameworks, enriching them.

INSURANCE

Misguided Priorities

WHEN an objective history of the recent period is written, it will no doubt show that the American banking, financial and insurance companies' desire to get an entry into the Indian market was one of the prime motivating factors for forcing India to sign the Final Act of the GATT agreement at Marrakesh. A pressing issue in these deliberations was apparently the opening up of the insurance market, because the insurance industry has been facing a severe recession and pension funds, which are a major component of the life insurance business in the US have been facing stiff competition from mutual funds and other specialised financial institutions offering various financial products. Admittedly, the primary goal in naming some of the countries like India and Brazil in the hit list under Section 301 of the specially-introduced US Omnibus Trade and Competitiveness Act, 1988 was to bring these countries to the discussion table at the GATT negotiations. As early as May 1989, India was targeted for attack under Super 301 for having country regulations which were said to be discouraging foreign investment in services like banking and insurance. With the signing of the GATT agreement and a generally succumbing American pressure, India has its hands tied insofar as the insurance sector is concerned. Under the agreement, the market access obligation does not permit India to impose quantitative conditions such as limiting the number of firms allowed in the insurance industry; likewise, under the national treatment obligation, it cannot, for instance, impose on insurance firms the requirement that reserves be held locally on the ground that this would otherwise worsen the conditions of competition for foreign-based firms. The reported signing of a

protocol of understanding between the Tatas and the American Insurance Group (AIG) for setting up a joint venture even before the Malhotra Committee report on the insurance sector was tabled in parliament and before the government announced its decision on the Committee's recommendations seem, to say the least, intriguing.

In the final analysis, the government decision will no doubt be entirely guided by the GATT agreement and by American influence on economic policy-making in India in the wake of a series of defence and political accords between the two countries. But the government is in something of a bind. For, if US business demands are to be satisfied, the government would have to be much more liberal than what the Malhotra Committee has chosen to recommend. For instance, the Malhotra Committee has specifically recommended that if and when the entry of foreign insurance companies is permitted, "it should be done on a selective basis"; they are required to float Indian companies for the purpose, preferably in joint venture with Indian partners. The report has also specified that the promoters' holding in a private insurance company should not exceed 40 per cent or be less than 26 per cent of the total paid-up capital. Interestingly, a member of the committee and a former LIC actuary found it necessary to clarify that the report did not bar fully-owned foreign ventures. The chairman of the International Insurance Council of the US and head of the US insurance delegation which visited India recently, Edward Hanaway, has commented that "we cannot specify what percentage of equity we would want, but 40 per cent is not enough". Reports have suggested that the delegation also sought the rescinding of the minimum capital requirement of Rs 100 crore fixed by the Malhotra Committee and that US companies preferred a majority holding for joint ventures.

Apart from the stiff opposition of trade unions and informed public opinion in India, the government is also faced apparently with a ticklish recommendation of the Malhotra Committee that the government shareholding in the LIC, the wholly state-owned organisation, should be brought down to 50 per cent. A similar recommendation has been made in the case of the GIC and its subsidiaries - GIC should hive off the subsidiaries, its capital should be increased and with half of it to be retained by the government. Obviously, this contradicts the government decision to reduce its equity holdings to 51 per cent in the case of selected public sector undertakings generally. It is unlikely that the government can go even this far where banking and insurance are concerned, though Malhotra, the chairman of the committee has been singing a more aggressive song, joining the discussions

with the American delegation and asking the government to take a quick decision on the entry of foreign insurance firms. On the other hand, sensing serious opposition to the report, the government did not permit its officials to meet the US insurance delegation.

It is somewhat intriguing that the chairman of the committee should be asking for quick implementation of only that aspect of his report which seeks foreign entry. There are a number of issues raised in the report concerning the internal autonomy of the public sector institutions in the insurance sector which, in fact require more urgent attention. Though one may not quarrel with many of its recommendations, there is no doubt that the very conception of the Malhotra Committee was based on biased considerations and hence based on biased perspectives. At the outset, the report argues that the committee was appointed in furtherance of the initiatives in the areas of financial reforms covering the banking system and the capital markets, without explaining how this could be dovetailed into the broader objective accepted by the LIC, for instance, "to spread life insurance much more widely and in particular to the rural areas, and to the socially and economically backward classes".

While the performance of the LIC and the GIC and its subsidiaries has not been a model of efficiency, their business expansion after nationalisation, the diversified portfolio that they have built and the extent of special social groups and social security schemes that they have covered, have been impressive. The Malhotra Committee report does not contain a closer analysis of the costs and benefits, nor of the uncovered gaps in rural insurance or insurance for the backward classes such as weavers, rickshaw-pullers, fisherfolk, tailors, beedi workers and primary milk producers by the LIC, or in GIC's many socio-economic schemes such as cattle and livestock insurance, poultry insurance,

Corrigendum

In the Advertisement for Research Positions in the Vaikunthbhai Mehta Research Centre for Decentralised Industries, published in the *Economic and Political Weekly* dated February 17-25, 1995 on page 375 in paragraph 2, line 7, the sentence beginning with the words "Wide exposure" should read as under:

"Wide exposure to field conditions in rural development and rural industries, enterprise development/management programmes, and work of voluntary agencies and with good knowledge of one and more regional languages preferred."

agricultural pumpsets insurance, crop insurance, etc. The committee apparently believes that private and foreign firms will find the rural insurance equally lucrative. It has recommended that the new entrants into the life insurance field should write a specified proportion of their business in rural areas and that they should not avoid writing small policies. Also, the general insurance companies should maintain a balanced portfolio and should not, in particular, avoid writing motor insurance and covering rural non-traditional business. If the perspectives with which the private or foreign business enter the financial sector services including insurance are any guide, the new institutions will, without fail, concentrate more on lucrative business to the neglect of the small customer and the rural sector. In a society which offers poor social security facilities and with a vast informed business sector, the life as well as general insurance sector has to combine insurance of both niche activities as well as those serving the vulnerable sections of society. This in turn implies that there is no option but to go in for some degree of cross-subsidisation as between different types of insurance under the same individual organisations. It would be in the fitness of things if the government takes quick decisions on those sections of the Malhotra report which concern the revitalisation of existing institutions, their operational freedom and organisational responses to customer needs, including the appointment of an ombudsman for the insurance sector.

AKALI UNITY

Other Motives

ALTHOUGH the main Akali parties, Akali Dal (Badal) and Akali Dal (Amritsar), have decided to merge by April 13, the merger may fail to see the light of day. Even if the merger comes to pass, it may begin to come apart before long.

The kind of unity sought to be cemented on April 13 has failed several times in the past although it was achieved each time under the pressure of the head priest of the Akal Takht. When the faction leaders decided to form their own parties, the head priest of the time could do little to stop them. The unity this time too has been attained under the pressure of the head priest, and the pressure was more on the Akali Dal(B). The other party escaped the pressure because it was itself instrumental in starting the unity moves: although the head priest, Manjit Singh, was himself interested in bringing about unity, Ourcharan Singh Tohra, president of the SGPC and leader of the Akali Dal(A), had been goading him to hasten the process. Part of Tohra's

motivation was to stop the growing influence of Akali Dal(B) under the leadership of his main rival in Akali politics, Parkash Singh Badal; partly, he wanted to annex the leadership of the unified Akali party.

Parkash Singh Badal, whose party was heading to become the main force in the Punjab politics along with the Congress, and who will not be the undisputed leader of the new party, would resent the loss of power and prestige the unification would bring him, especially when there would be a corresponding increase in the power of Tohra. Even at a personal level, Badal does not easily eat humble pie; if he bows to undesirable pressure at one point, he finds a reason to rebel to salvage his image later.

More importantly, there is a serious disagreement between the two parties over a matter of principle: the attitude towards the 'Amritsar declaration' which was adopted when all factions barring Akali Dal(B) united last year to form Akali Dal(A). Although the joint unity statement makes no mention of the declaration, there was a furious debate about it during the latest negotiations, and Bhai Manjit Singh and Sucha Singh Chhotepur, the leaders representing the militant Simranjit Singh Mann who is in jail, at one stage walked out of the meeting; they were insisting that the Amritsar declaration, which takes an ambiguous stand for a separate Sikh state, could neither be scrapped nor amended. Akali Dal(B), on the other hand, believes in greater autonomy for Punjab, along with other states, and has always opposed the controversial declaration.

Finally, the unity statement allows the two parties to retain their independent identities till April 13 and to hold certain specifically mentioned rallies in their separate capacities. Akali Dal(B) has already held one such rally on February 27 during which its leaders made no mention of the coming unity but demanded, precisely, greater autonomy for Punjab. Which may be interpreted as a sign of things to come so far as the unification of the two Akali parties is concerned.

INDIA AND RUSSIA

Zhirinovsky's Friends

A RECENT survey shows that Vladimir Zhirinovsky, the leader of the Liberal Democratic Party (LDP), is, as of now, the candidate most likely to become the next president of Russia. The recent visit of Zhirinovsky to India and the statements he made here acquire significance in the light of this finding.

Perhaps the most startling, and in a sense the most worrisome, revelation of the visit was Zhirinovsky's emphasis on a special

relationship the LDP would like to develop with the BJP. The revelation was startling because most of the followers of the LDP believe in the Russian Orthodox Church, whereas the BJP, despite the pseudo-secular platform it occasionally attempts to appropriate, is a Hindu fundamentalist outfit. The worrisome aspect of the revelation comes from the fact that the BJP is a major force on the Indian political scene and, despite its currently dispirited state, its ascendance to power at the centre in future cannot be entirely ruled out.

This outcome of the Zhirinovsky visit, however, should have been expected. For, in spite of their different and seemingly conflicting religious backgrounds, the LDP and the BJP manifest remarkable similarities in their ideology. Both play upon the historical and religio-cultural sentiments of, and seek to mobilise, a single community, which happens to be the largest in numbers in their respective countries. Both deride and want to suppress the minorities. Both are feudal-capitalist and inward-looking in their economic outlook. Both share a male-heavy and patriarchal attitude and are therefore anti-feminist and overlook the interests of the weaker sections of society. Finally, both are extremely nationalist and jingoist in their external policy.

In the context of South Asia, perhaps it was not purely coincidental that this latter aspect of the shared world-view of the LDP and the BJP came out most strongly in Zhirinovsky's statements. While spelling out the likely strategic linkages between Russia and India of his vision, he exhorted the latter to annex Pakistan and Bangladesh which were at one time part of India. This exhortation had a likeness to what Zhirinovsky would ideally want Russia to do once the LDP was placed in power there: expropriate territories traditionally dominated or controlled by Russia to bring into existence, once again, an imperial Russia.

Despite the fact that the notion of an imperial Russia and of, what one may call, a greater India, sounds anachronistic in the post-cold war world, it cannot be dismissed as the raving of a politician gone out of his mind — given the status of the LDP and the BJP in contemporary Russia and India, respectively, and the proximity between the two parties that the Zhirinovsky's visit has brought to light. However, what demands greater attention is that even the Congress, which apparently shares very little with the ideology of the LDP, should attempt to warm-up to Zhirinovsky as a future leader of Russia. This behaviour, which stems primarily from Zhirinovsky's pro-India attitude on Kashmir, is not likely to send India's smaller neighbours into throes of delight.

KALYANI STEELS

Out of Recession

KALYANI STEELS has performed satisfactorily in 1993-94 with net sales going up by 5 per cent (Rs 5.7 crore) and net profit rising by 6 per cent, though operating profit fell by 24 per cent. Other income rose by 58 per cent (Rs 5.14 crore) and nil taxation and a 71 per cent fall in interest charges helped in holding up margins. A 106 per cent (Rs 9.55 crore) fall in non-operating surplus and a 15 per cent (Rs 62 lakh) increase in depreciation were detrimental to the company's bottomline. A dividend of 40 per cent was declared for the year.

Earning per share fluctuated at Rs 8 in 1991-92, Rs 9 in 1992-93 and Rs 6 in 1993-94. Depreciation to gross value added fell by 4 percentage points in 1992-93 and then rose by 18 percentage points in 1993-94. Inventories grew by 31 per cent. Raw materials consumed to value of production has steadily risen from 47 per cent in 1991-92 to 48 per cent in 1992-93 and 54 per cent in 1993-94. Sales to total assets fell from 59 per cent in 1991-92 to 28 per cent in 1992-93 and 23 per cent in 1993-94, while sales to gross fixed assets fell from 121 per cent to 58 per cent and 36 per cent in the same period. Net value added to value of production fluctuated at 25 per cent in 1991-92, 34 per cent in 1992-93 and 10 per cent in 1993-94. Remuneration to employees rose by 24 per cent in 1993-94. Inventories to sales fluctuated at 24 per cent in 1991-92, 23 per cent in 1992-93 and 28 per cent in 1993-94. Sundry creditors to current assets fluctuated at 19 per cent in 1991-92, 11 per cent in 1992-93 and 18 per cent in 1993-94. Short-term bank borrowings to inventories fell by 28 percentage points in 1992-93 and rose by 15 percentage points in 1993-94. Debt-equity ratio fluctuated at 191 per cent in 1991-92, 427 per cent in 1992-93 and 136 per cent in 1993-94.

The company has plans to set up a Rs 200 crore steel project using the mini-blast furnace route, which will manufacture billets, bars, rounds, etc. Bharat Forge, the flagship company, will consume a part of the output. The company invested Rs 11 lakh on its research and development activities in 1993-94.

EICHER MOTORS

In the Red Still

Eicher Motors was incorporated in 1982 in technical and financial collaboration with Mitsubishi Motors Corporation and

Mitsubishi Corporation, Japan, for the manufacture of light commercial vehicles of 6 ton gross vehicle weight. The company has been incurring losses for the past two years. The loss was lower in 1993-94 compared to the previous year. Net sales were up by Rs 21.39 crore (20 per cent) and operating profit by Rs 5.21 crore (410 per cent). Net profit was down by Rs 9.78 crore (54 per cent). Depreciation and interest charges were up by 70 per cent and 5 per cent, respectively. Non-operating profit and other income fell by 78 per cent and 53 per cent, respectively. All these had a negative impact on the margins of the company. Exports and imports increased by 162 per cent and 29 per cent, respectively.

Debt-equity ratio fluctuated at 184 per cent in 1991-92, 268 per cent in 1992-93 and 147 per cent in 1993-94. Short-term bank borrowings to inventories fluctuated at 8 per cent in 1991-92, 11 per cent in 1992-93 and 1 per cent in 1993-94. Sundry creditors to current assets ratio after being steady for two years at 39 per cent increased by 2 percentage points in 1993-94. Sales to total assets fluctuated at 161 per cent in 1991-92, 128 per cent in 1992-93 and 133 per cent in 1993-94, while sales to gross fixed assets declined from 502 per cent in 1991-92 to 380 per cent in 1992-93 and 347 per cent in 1993-94. Inventories to sales fell by 2 percentage points in 1992-93 and by 7 percentage points in 1993-94. Export to sales has shown steady increase by 1 percentage point in 1992-93 and 5 percentage points in 1993-94. Raw materials consumed to the value of production marginally fluctuated at 78 per cent in 1991-92, 79 per cent in 1992-93 and 77 per cent in 1993-94. Net value added to value of production fluctuated at 9 per cent in 1991-92, 6 per cent in 1992-93 and 8 per cent in 1993-94. Remuneration to employees rose by 21 percentage points in 1992-93 and fell by 17 percentage points in 1993-94.

The reason for its loss, according to the company, was the continued appreciation of yen, pushing up the cost of imported components, recessionary tendencies in the industry, loss of production due to hike in customs duty on imports coupled with transporters' strike, high depreciation and interest charges. The commercial vehicles industry grew by 24 per cent in 1993-94. Production was up by 20 per cent for the year. With a view to finance the company's customers, it has floated an Auto Finance Division.

Eicher Motors invested Rs 81 lakh in R and D in 1993-94. The major focus was on technology absorption, adoption and innovation.

ETERNIT EVEREST

Low Margins

Eternit Everest, of the Brussels-based Eternit Group, manufactures fibre-based asbestos cement products. The company enjoys a market share of roughly 30 per cent. Net sales were up by 9 per cent (Rs 9.45 crore), operating profits were down by 9 per cent (Rs 1.88 crore) and net sales by 1 per cent (Rs 14 lakh). Intense competition and price-cutting have put pressure on margins. Rise in other income by 304 per cent (Rs 1.40 lakh), fall in interest charges by 25 per cent (Rs 16 lakh), in depreciation by 1 per cent (Rs 3 lakh) and in taxation by 17 per cent (Rs 1.60 crore) helped in arresting the fall in net profit. Exports increased by 650 per cent (Rs 39 lakh) and imports by 14 per cent (Rs 3.03 crore). A 30 per cent dividend was declared for the year.

Debt-equity ratio showed a consistent fall from 8 per cent in 1991-92 to 4 per cent in 1992-93 to 2 per cent in 1993-94. Sundry creditors to current assets fluctuated at 66 per cent in 1991-92, 65 per cent in 1992-93 and 72 per cent in 1993-94. Sales to total assets fluctuated at 139 per cent in 1991-92, 147 per cent in 1992-93 and 135 per cent in 1993-94. Sales to gross fixed assets have risen steadily in the past three years from 311 per cent in 1991-92 to 329 per cent in 1992-93 and 339 per cent in 1993-94. Inventories to sales, after being steady at 27 per cent during 1991-93, rose by 4 percentage points in 1993-94. Growth in inventories fluctuated at 124 per cent in 1991-92, 19 per cent in 1992-93 and 24 per cent in 1993-94. Raw materials consumed to value of production was steady at 49 per cent from 1991-93 and then rose to 59 per cent in 1993-94. Return on investment grew by 4 percentage points in 1992-93 and has fallen by 6 percentage points in 1993-94. Earning per share fluctuated at Rs 13 in 1991-92, Rs 16 in 1992-93 and Rs 8 in 1993-94. Net value added to value of production rose by 3 percentage points in 1992-93 and fell by 5 percentage points in 1993-94. Remuneration to employees fluctuated at 49 per cent in 1991-92, 38 per cent in 1992-93 and 45 per cent in 1993-94.

The company has plans to modernise its technology and focus on marketing of internal panelling and low cost roofing aimed at the rural market. The company also plans to embark on an expansion-cum-diversification plan.

A new factory has been set up in Nashik to manufacture a range of cement-based products for various applications in the building materials industry. The plant is expected to be commissioned by the end of 1994-95.

The company's research centre at Bangalore and Kymore are recognised by the Department of Science and Technology.

GOODLASS NEROLAC

Enlarged Capacity

Goodlass Nerolac Paints is a 72-year old Bombay-based company engaged in the manufacture of paints, enamels, varnishes, oils, pigments, colours, alkyds and resins. Net sales increased by 18 per cent (Rs 32.62 crore) in 1993-94, operating profit by 14 per cent (Rs 2.97 crore) and net profit by 10 per cent (Rs 75 lakh). Taxation fell by 9 per cent (Rs 70 lakh) but depreciation and interest charges were up by 250 per cent (Rs 1.58 crore) and 9 per cent (Rs 55 lakh), respectively. Other income was up by 51 per cent for the year. But for the rise in depreciation and interest charges the margins would have been higher. A dividend of 35 per cent was declared for the year as against 30 per cent in the previous year. Exports and imports were up by 70 per cent (Rs 3.41 crore) and 40 per cent (Rs 5.57 crore), respectively.

Sales to total assets increased steadily from 151 per cent in 1991-92 to 155 per cent in 1992-93 and 160 per cent in 1993-94. Sales to gross fixed assets fell from 802 per cent in 1991-92 to 544 per cent in 1992-93 and 484 per cent in 1993-94. Sundry creditors to current assets rose from 32 per cent in 1991-92 to 37 per cent in 1992-93 and 40 per cent in 1993-94. Return on investment fluctuated at 11 per cent in 1991-92, 14 per cent in 1992-93 and 13 per cent in 1993-94. Gross saving to gross capital formation fell by 45 percentage points. Raw materials consumed to value of production fell by 4 percentage points in 1992-93 and rose marginally by 1 percentage point in 1993-94. Export to sales grew by 2 percentage points for 1992-93 and 1993-94. Earning per share rose from Rs 6 in 1991-92 to Rs 10 in 1992-93 and Rs 11 in 1993-94. Net value added to value of production fluctuated at 16 per cent in 1991-92, 20 per cent in 1992-93 and 17 per cent in 1993-94. Debt-equity ratio rose by 10 percentage points in 1992-93 and 1993-94. Short-term bank borrowings to inventories was 54 per cent in 1991-92 and has since then been steady at 45 per cent in 1992-93 and 1993-94. Remuneration to employees stood at 39 per cent in 1991-92 and has been steady at 34 per cent during 1992-94.

The company's new unit at Kanpur with a licensed capacity of 15,000 MT for the manufacture of paints, enamels and varnishes commenced commercial production in August 1993. The two wholly-owned subsidiaries, Saurashtra Paints and GNP, fared satisfactorily.

GODREJ FOODS

Rise in Sales

The Bombay-based Godrej Foods has done well for the year. Net sales were up by 31 per cent (Rs 25.8 crore), operating profit by 70 per cent (Rs 2.11 crore) and net profit by 318 per cent (Rs 3.41 crore). A marginal fall in depreciation and interest charges by 7 per cent, nil taxation, and a 57 per cent increase in non-operating profit helped in increasing margins. Other income fell by 30 per cent. Imports were up by Rs 13 lakh.

Debt-equity ratio increased steadily for the past three years from 43 per cent in 1991-92 to 68 per cent in 1992-93 and 73 per cent in 1993-94. Sundry creditors to current assets was steady at 34 per cent from 1991-93 but fell by 25 percentage points in 1993-94. Short-term bank borrowings to inventories declined by 12 percentage points in 1992-93 and by 7 percentage points in 1993-94. Sales to total assets fluctuated at 201 per cent in 1991-92, 230 per cent in 1992-93 and 215 per cent in 1993-94, while sales to gross fixed assets steadily increased from 355 per cent in 1991-92 to 382 per cent in 1992-93 and 466 per cent in 1993-94. Inventories to

sales fluctuated and 11 per cent in 1991-92, 10 per cent in 1992-93 and 12 per cent in 1993-94. Raw materials consumed to value of production fell by 18 percentage points in 1982-93 and increased by 9 percentage points in 1993-94. Earning per share increased from Rs 0.87 in 1992-93 to Rs 3 in 1993-94. Return on investment showed a rise by 6 percentage points. Net value added to the value of production registered a sharp increase of 10 percentage points in 1992-93 and then grew marginally by 1 percentage point in 1993-94. Remuneration to employees fell from 150 per cent in 1991-92 to 29 per cent in 1992-93 and 19 per cent in 1993-94, while remuneration to employees to value of production remained steady at 3 per cent during 1991-93 and then fell by 1 percentage point in 1993-94.

The company has agreed to be the Indian distributor for the Blue Diamond almond growers of California. Heinz, Conagra and Grand Met are the three food giants who have been seeking a tie-up with the company. Grand Met initially plans to launch its Pillsbury range of food products in India. The company is also to introduce fresh fruit juices in tetrapack containers for the domestic and export markets.

CURRENT STATISTICS

EPW Research Foundation

Foreign direct investment (FDI) approvals had touched Rs 27,470 crore (\$ 8.76 billion) up to the end of 1994, including Rs 5,230 crore (\$ 1.67 billion) of GDR proposals in 1994. Actual FDI inflow was Rs 5,783 crore (\$ 1.84 billion), over 50 per cent of it in 1994. About one-fourth of FDI approvals were in power and oil refining, 13 per cent in electrical and non-electrical machinery and 7.5 per cent in transportation industry. Agro-based industries, financial services, hotels and tourism and miscellaneous services have attracted nearly one-third of total FDI. About 48 per cent of FDI approvals have gone to Maharashtra, Gujarat and Delhi, with UP (0.6 per cent) and Bihar (0.3 per cent) getting almost nothing.
